Rhachi fractiflexa multiflora, bracteis oblongoligulatis obtusiusculis ovariis pedicellatis quater brevioribus, sepalis tepalisque cuneato ob-

longis acuminatis, labello bene unguiculato, dimidio antico dilatato in laminam trifidam, laciniis lateralibus semioblongis bene obtusatis, lacinia media triangula acuminata.

Ocanna. „Pétales jaunes tachetés de rouge.“ 4—5000'. Junio. 992. Schlim!

13. MORMODES PARDINA Bat. Orch. Mex. Guat. t. 14. Lind. Bot. Reg. XXIV. Misc. 176. et Bot. Reg. XXIX. (1843). Not. sub 33:

Foliis elongatolanceolatis, racemo elongato multifloro, sepalis petalisque lanceolatis acuminatis subsecundis, labello plano conformi acuto tridentato unguiculato.

Hook. Bot. Mag. 3900: pseudobulbis turbinatis, pp. B. Reg. XXIV. 1. superne citato: „Discovered by Karwinski in Oaxaca; flowered at Knypersley Jul. 1837. Its flowers are of a primrose colour spotted with reddish purple in every part and they exhale a most delightful perfume. Its habit is very robust, being at least three times as large as that of the old *M. atropurpureum*. — Bot. Reg. XXV. 1839. Misc. 7.: *Cyclosia maculata* Klotzsch Allg. Berl. Gtz. 1838. n. 39. p. 305. 306. a supposed new Mexican Orchid plant appears to be *Mormodes pardina*.

var. *unicolor* Hook. B. M. 3879: floribus concoloribus.

14. MORMODES LINEATUM Bat. in Bot. Reg. 1841. Misc. N. 107. 1842. XXVIII. t. 43:

Racemo elongato multifloro, sepalis petalisque oblongo-linearibus abrupte acutis margine reflexis, labello lineari incurvo carnosissimo sparsim piloso versus basin utrinque dente nunc brevi nunc elongato aucto, columnae dorso et margine pubescente. Guatemala.

The flowers are deliciously fragrant; when they afterwards acquire a bright warm yellow tint and the markings upon them increase in intensity till they have become orange red.

Huc: *Mormodes Warscewiczii* Klotzsch Berl. Allg. Gtz. 1854. 64.

Pseudobulbis ovatis parvis foliosis; foliis octo, linearilanceolatis acuminatis papyraceis laxiusculis leviter nervosis; racemis brevibus septemfloris; perianthii foliolis rufescentibus campanulatis apertis acuminatis, subtus pallidioribus, margine revolutis, exterioribus lanceolatis, interioribus ovato lanceolatis, labello angusto trifido, supra laete roseo sparsim longissime piloso, subtus pallido, lobis lateralibus retrorsis brevioribus; gynostemio puberulo candido semitortuoso; anthera rosea longirostrata biloculari, caudicula lata candida; polliniis globosis rufescentibus.

Peru. Warscewicz. col. Gireoud.

15. MORMODES HISTRIO Lind. Rehb. fl. in Otto Hamburger Gtz. 1859. 54.

1421. STANHOPEA Frost.

Hook. B. Mag. 2348, 2349.

Plantae bene cognitae. Inde vix necessarium videtur, utramque monographiam prode, quae apparuit. Prima a cl. Lindley edita, impressa 1. Octobri 1852, seriem hanc effecit: §. 1. *Densiflora*. Mesochilium cornutum. Epichilium integrum. Bracteae ovario subaequales. 1. S. insignis Frost. 2. S. inodora Lodd. 3. S. Bucephalus Lindl. §. 2. *Laxiflora*. Mesochilium cornutum. Epichilium integrum. Bracteae ovario multo breviores. 4. S. oculata Lindl. 5. S. guttulata Lindl. 6. S. Wardii Lodd. 7. S. Ruckeri Lindl. 8. S. graveolens Lindl. 9. S. quadricornis Lindl. 10. S. Warscewicziana Klotzsch. §. 3. *Tridentata*. Mesochilium cornutum. Epichilium tridentatum. 11. S. tigrina Bat. 12. S. Martiana Bat. 13. S. Devoniensis Lindl. 14. S. velata Morr. 15. S. saccata Bat. 16. S. tricornis Lindl. §. 4. *Ecornuta*. Mesochilium muticum. 17. S. cirrhata Lindl. 18. S. grandiflora Lindl. 19. S. eburnea Lindl.

20. *S. ecornuta* Lindl. Alteram ego edidi post Lindleyanam monographiam, quam hic reddere juvat. Cf. *Xenia Orchidacea* I. p. 116:

Sepala ac tepala minora carnosio membranacea libera (tepala raro gynostemio adnata cf. *Stanhopeam ecornutam* Lemaire) anthesi vulgo reflexa. Labellum totum eboraceum ante basin non abruptum, ibi nunquam planum, limbis semper erectis; integrum (*Stanhopeastrum*), seu trilobum lobis lateralibus erectis callo transverso coalitis, lobo medio antico trilobo, disco minuto sessili seu unguiculato (*Stanhopea Haseloviana* Rehb. fil.), lobis lateralibus corniformibus, lobo medio laminam trullaeformem sistente; lobus medius cum lobis lateralibus coalitis vulgo articulatus; lobulus anticus cum disco lobulorum lateralium etiam vulgo articulatus. Gynostemium liberum seu cum labelli basi connatum (*Stanhopea connata* Klotzsch; *ecornuta* Lemaire); rectum seu arcuatum, alatum seu apterum. Androclinium planum, rectum, seu proclive, alula utrinque cinctum seu nudum; rostellum tridentatum; fovea minuta transversa supposita. Pollinia linearia fissa, rarissime sessilia, vulgo in caudicula elongata subterminalia; glandula triangula retrorsum sagittata, rhombea (*Stanhopea connata*) transverse bicurvis (*Stanhopea ecornuta*). Vandae Americanae tropicae.

A. Stanhopeastrum.

Labellum unimembratum simpliciter calceolare. (Est labellum integrum.)

1. STANHOPEA CALCEOLUS Rehb. fil. l. c.:

Labello pandurato calceolato acuminato (supra lineam mediam inferioris paginae lineato?), tepalis ligulatis acutis reflexis, gynostemio crasso aptero.

Sepala flava. Tepala et labellum aurea. Gynostemium albidum. Pedunculus biflorus. Am. Centr. De Warscewicz.

2. STANHOPEA ECORNUTA Lemaire Flore des Serres II. 181:

Labello calceiformi obtusissimo margine gibberoso, medio sella turcica ornato, tepalis obtuse rhombeis, gynostemio depresso prope aptero.

Rehb. fil. *Xenia* tab. 43. p. 124:

Stanhopea ecornuta Ch. Lemaire in Flore des Serres. 1846. 181. Lindl. Fl. Garden. Xyl. 20. (iterata praecedens). Rehb. fil. in v. Mohl u. v. Schl. Bot. Ztg. X. 1852. 836.

Anguloa Coryanthes Klotzsch in Herb. Berol. et Hort. Decker.

Stanhopeastrum ecornutum Rehb. fil. in v. Mohl und v. Schlechtendal Bot. Zeitung. X. 1852. 927.

Pseudobulbus conico turbinatus. Folium Stanhopearum. Pedunculus abbreviatus crassus vaginis paucis triangulis distichis punctulatis scariosulis vestitus biflorus. Bractee ovaria cylindracea superantes. Sepala oblonga membranacea carnosula apice attenuato suberoso carnosula. Tepala minora obtuse rhombea cum gynostemio altius connata. Labellum calceolare eboraceum postice inferne ventricosum; limbus inersatus apice obtuse acutus, supra apicem trigibbus, gibberibus lateralibus bilobis; sella turcica in disco antice utrinque in paginam labelli transcendens. Gynostemium transverse semiteres crassum utroque latere crasso alato marginatum; rostellum trilobum pendulum; anthera oblonga depressa antice lato alata, marginata; pollinia cuneato ligulata ab externo margine fissa; caudicula lineari rhombea brevis; glandula triangula seu linearis transversa bicurvis. Stigma sub rostello absconditum. — Perigonium albedo ochroleucum flaveolo irroratum striatumque. Labellum lapidis politum instar nitidissimum, antice candidum, postice aurantiacum punctulis purpureis. Gynostemium pallide stramineum basi antice purpureo guttulatam.

B. Stanhopeae eburneae.

Labellum bimembratum; mesochilium evanidum; hypochilium et epichilium evoluta. (Est labellum integrum.)

3. STANHOPEA EBURNEA Lindl. Bot. Reg. 1529:

Labello calceiformi ligulato pandurato acuto, ante basin utrinque antrorsum unidentato, carina marginante a basi ultra medium, carinula supposita in basi, fovea hypochilii semiovata intus puberula, mesochilio solido postice retuso, antice erosulo, seu integro angulis prosilientibus utrinque marginato, epichilio triangulo; gynostemio utrinque dimidio anteriori semiovato alato, alulis subnullis.

— Bot. Mag. 3359. *Stanhopea calceolata* Hort. Pedunculus bi- — triflorus. Bractee ovatae acutae ovariiis triplo breviores. Sepala oblonga. Tepala linearia. Perigonium ochroleuco-album. Labellum candidum purpureopictum. Crescit in Brasilia. (Hortul.). Surinamo: Wulschlägel! Venezuela: Wagener (fecit iconem et misit plantas vivas)

Obs. III. Lindley sejungit *St. eburneam* et *St. grandifloram* ex situ dentium hypochilii, longitudine epichilii, apertura hypochilii, limbo antico epichilii. Reperimus sat multos status medios; numquam si quidem vidimus plantam, cujus epichilium mesochilio aequale, tamen vulgo dentes ex medio limbo hypochilii prosiliebant.

4. STANHOPEA CIRRHATA Lindl. Journ. Hort. Soc. V. 37:

Hypochilio semiovato antrorsum utrinque angulis carnosis prosilientibus instructo, (mesochilio nullo), epichilio ovato acuto supra basin foveato, tepalis ligulatis acutis reflexis, gynostemio semitereti crasso apice utrinque alula lineari erecta praedito.

Lindley Flower Garden I. 31. xyl. 19. Pedunculus uniflorus vaginis distichis acutis vestitus. Bractea ovario longior. „Sepala alba. Tepala et labellum aurea. Anguli labelli atroviolacei.“ Nicaragua. Warszewicz.

C. Stanhopeae genuinae.

Labellum trimembratum: hypochilium, mesochilium, epichilium evoluta. Mesochilium bicorne. (Est labellum trifidum.)

AA. Labellum exarticulatum.

5. STANHOPEA TRICORNIS Lindl. Journ. Hort. Soc. IV. 263:

Hypochilio depresso oblongo basi utrinque angulato cum mesochilio bicorni esulcato continuo, cornubus rectis abbreviatis, epichilio lineari oblongo concavo truncato, apice lobato, margine membranaceo, dorso valde gibboso, superne dente brevi recto aucto; tepalis carnosis rhombeis; gynostemii alis semiovatis in dimidio superiori; alulis obtusangulis.

Lindl. Fl. Garden. I. p. 31. xyl. 24. — Ex nob. de Warscz.: tepala rosea, reliquus flos albus. Pedunculus biflorus vaginis valde abbreviatis ochreatis vestitus. Bractee oblongae apiculatae ovariiis dimidio breviores. Flores illis *Stanhopeae oculatae* majores. — Peruvia occid. de Warszewicz.

BB. Labellum uniarticulatum sc. in junctione hypochilii cum mesochilio. Mesochilium cum epichilio exarticulatum.

6. STANHOPEA CONNATA Klotzsch in Otto et Dietrich Allg. Gartenz. 1854. 226:

Labello subconfluenti, hypochilio exacte semigloboso utrinque bicarinato, carinis basin versus convergentibus canali angusto(?), cornubus late falcatis, epichilio late rhombeo curvato haud ita manifeste articulado,

tepals ligulatis bene acutis, gynostemio crasso depresso basi utrinque velutino aptero alulis falcatis inflexis.

Ad vivam haec scripsimus: aff. *St. Devoniensi* cornubus falcatis infra introrsum implicatis, epichilio ovato acuto, hypochilio basi gynostemii dilatati apteri apice bifalcis adnato. — Pedunculus uniflorus. Bractea ovarii quadripollicaris dimidiam aequans. Sepala ac tepala reflexa. Sepala oblonga acutiusecula vitellina. Tepala ligulata acuta vitellino aurantiaca, basi purpureo aurantiaca. Hypochilium *Stanhopeae Devoniensis* Lindl. saccatum (nec didymum), humile, latum, transversum, hinc sulculis quasi aratum, atropurpureo aurantiacum, maculis obscurioribus signatum; carina transversa obliqua antica cum margine summo confluens, triangulum nitidum describens; margines superiores per tres lineas cum gynostemio connati. Epichilium et mesochilium aurantiaca. Mesochilium cum epichilio (altiori, quam hypochilium) non bene articulatum. Gynostemium crassum, rectum, transsectione prope depresso tetragonum, utraque basi velutinum, infra foveam minutissimam longitudinaliter striatum. Anguli membranacei trianguli inflexi utrinque pone androclinium. Discus elevatus medio longitudinaliter costatus sub fovea. Pollinia oblongo ligulata extus sulcata sessilia in glandula rhombea. — Et haec habuit cl. Klotzsch l. c. „Pseudobulbis globoso ovatis, leviter striatis, monophyllis, foliis ovalibus brevissime recurvato acutis petiolo semisulcato longioribus; bracteis ovarii brevioribus: perigonii foliolis exterioribus flavidis, apice margineque recurvis purpureo punctatis minoribus; labello vitellino, hypochilio brevissimo saccato, dorso striis punctulisque purpureis obsito, infra scrotum glanduloso fusco plicato, antice fusco rubro oculato, marginibus cum gynostemii pede connatis, epichilio latissimo recurvo acuto, cornubus late falcatis acuminatis epichilio aequalibus; columna candida crassa exunguiculata dentibus duobus magnis terminata.“ „Von *Stanhopea graveolens* unterscheidet sie sich dadurch, dass das untere Glied der Kronenlippe oder das Hypochilium mit der verdickten Basis der Stempelsäule verwachsen ist.“ *Stanhopea graveolens* Klotzsch (nec Lindl.) forsán est *Stanhopea Devoniensis* Lindl.? — Ex Peruvia boreali misisse dicitur cl. de Warscewicz. Floruit in horto Mathieu Berolinensi. — Cf. Rehb. fil. in Otto Hamb. Gtz. 1860. pag. 422.

CC. Labellum biarticulatum sc. in junctioe hypochilii ac mesochilii, et mesochilii et epichilii.

AAA. Hypochilium semiglobosum.

I. Epichilium integrum acutum.

7. STANHOPEA INSIGNIS Frost in Hook. Bot. Mag. 2948. 2949:

Hypochilio sessili semigloboso, a basi medium versus superne oblique bicarinato, angulis capitis obtusis; canali subamplo; pectore arguto; cornubus teretiusculis; epichilio ovato acuto; tepalis lineari ligulatis; gynostemii alis semioblongis dimidium usque, ante alulas constrictis; alulis obtusatis. Lodd. Bot. Cab. 1985. Lindl. Bot. Reg. 1837.

Racemus densus. Bractee ovario aequales. Sepala ovata acuta. Perigonium flavum seu armeniacum, maculis circularibus atropurpureis multis. Gynostemium ac labellum albidum, punctulis atrokermesinis. Labelli basis et gynostemii dorsum viride. — Ex Brasilia allatam dicunt. Audivimus Berolini a de Warscewicz e Peruvia missam floruisse.

Obs. Huc forsán referenda: *Stanhopea maculosa* Knw. Westc. Floral Cab. III. 110. Nr. 74.

8. STANHOPEA WARSCEWICZIANA Klotzsch! in Otto und Dietrich Allg. Gartenztg. 1852. 274:

Hypochilio sessili semigloboso, utrinque ante apicem limbi uniangulato, dente subito in carinam perpendicularem brevem descendente, pectore obtusato, canali brevi angusto, cornubus teretiusculis, epichilio

ovato acuminato, tepalis linearibus acuminatis, gynostemii alis semiligulatis in alulas acutas antrorsas continuo transeuntibus.

Haec penes florem siccum madefactum, quae ad vivam iterum erunt revidenda. Ad dimus longam cl. auctoris diagnosin minime diagnosticam. „Pseudobulbis ovatis, apice attenuatis, longitudinaliter sulcatis, squamis membranaceis ovato lanceolatis acuminatis alutaceis minutissime nigro punctulatis obductis, apice monophyllis; foliis ovalibus utrinque attenuatis membranaceo coriaceis rigidis plicatis quinque- — septemnerviis longe petiolatis; bracteis pallidis germine acuminato subduplo brevioribus; perigonii foliolis sordide albidis, exterioribus majoribus patentibus, margine revolutis, apice reflexis; interioribus acuminatissimis undulatis reflexis, hypochilio sessili globoso lutescenti candido, extus glaberrimo et unidentato usque ad dentem profunde sulcato, epichilio late ovato acuto antice minutissime rubro punctulato incrassato, dorso concavo albido cornubus acutissimis incurvis, dente brevi inter cornua antice instructo; columna late alata basi unguiculata.“ Chiriqui de Warscewicz. Floruit apud hortul. Mathieu Berolini Julio exeunte 1852.

β. *Epichilium retuso tridentatum.*

9. STANHOPEA MARTIANA Lindl. Bot. Reg. 1840. Misc. 109 :

Hypochilio brevi conicosemigloboso, nunc didymo, utroque margine bicarinato, pectore argutiusculo, canali amplo, cornubus ancipitibus, epichilio ligulato apice retuso subaequaliter tridentato, sepalis oblongo ligulatis; gynostemio prope aptero et exalulato, velutino.

Lindl. ita describit: „imagine a plant, whose flowers have the size of *Stanhopea insignis*, the form of *Stanhopea venusta*, the smell of *Stanhopea oculata*, the colour of *Maxillaria aromatica*, and are arranged in a spike two feet long, and the reader will have a tolerably distinct conception of this beautiful thing, which Mssrs. Loddiges received from Mr. Bateman, who received it from Guatemala. It has the two dark spots of *Stanhopea oculata*, but they are in some manner lost in the flood of yellow that surrounds them.“) Endl. Parad. Vind. Fasc. 5. Spica oblongata multiflora. Bractee ovarii duplo breviores; seu aequales: *Stanhopea amoena* Klotzsch! — ob bractees longiores et folia (!) distincta! Vidimus specimina authentica et habuimus inflorescentiam authenticam vivam a dom. Mathieu. Ab ill. Lindley, qui descriptionem tantum noverat ad St. inodoram sub B. amoena (Folia 1. *Stanhopea* pag. 2. N. 2.) posita. Quid tamen cum *Stanhopea Bucephalo* quacum comparavit cl. Klotzsch commune habeat, nisi bractearum longitudinem, non intelligimus. *Stanhopea graveolens* Lemaire in Fl. des Serres VIII. 1846. 11. huc pertinet ob gynostemii alas super tertiam infirmam abruptis. Flores vulgo vitellini imo sulphureo ochroleuci tepalis purpureo punctulatis, nunc etiam sepalis; labello praesertim basi vitellino, apice pallidioro fundo foveae hypochiliaris intus atropurpureo fasciato, oculo utrinque extus inter carinas; punctulis crebris. Gynostemium alboviride atropurpureo punctulatum. — Ruiz et Pavon legerunt! Crescit in America centrali: Chiriqui de Warscewicz! Nova Granada de Warscewicz! Caracas (Appun! et Wagerer! vivam miserunt).

18. STANHOPEA GRAVEOLENS Lindl. Bot. Reg. 1840. Misc. 125:

Recedit a praecedenti canali aperto latiusculo, gynostemii alis basin gynostemii prope attingentibus.

? Ann. d. hort. de Gand. t. 54. (nuper non vidimus). — Sepala et petala straminea. Labelli basis armeniaca. Odor gravissimus. An varietas praecedentis? Cf. ill. Lindl. Bot. Reg. XXVI. 1840. Misc. sub 147. sub St. Wardii (var. Barkeri): „of this the fragrance is very agreeable, which is more than can be said of *Stanhopea Wardii* itself and some of the other varieties of which I now fear even *Stanhopea graveolens* N. 125. is one, so many forms have I examined within the last weeks.“ — E. Guatemala?

19. STANHOPEA RUCKERI Lindl. Bot. Reg. 1843. sub 44:

Recedit a praecedenti utraque hypochilio obovato, sc. basin versus attenuato.

Canalis angustus. Vulgo quam *Stanhopea Wardii* Lodd. paulo pallidior. — Varietate grammica Rchb. fil. in Otto und Dietrich Allg. Gartenztg. 1855. 243. est varietas coloris armeniaca. Hypochilii antrum purpureum lituris atris pictum; mesochilium et hypochilium rosea. Paulo accedit ad *Stanhopeam Wardii*. Pedunculus tredecim flores tenuit. C. Wrede Oschersleben. — Mexico fid. Loddiges.

20. STANHOPEA COSTARICENSIS Rchb. fil. in Otto Hamb. Gtz. 1860. 424:

ββ. Epichilium antice retuso semilunato excisum hinc utrinque unidentatum, denticulo in medio.

21. STANHOPEA FREGEANA Rchb. fil. in Otto und Dietrich Allgem. Gartenzeitung. 1855. 313:

Hypochilio a basi descendenti dein quadratulo superficie inferiori intruso utrinque sesquicarinato, mesochilii canali amplo, pectore antrorsum gibberoso obtuso, cornubus falcatis subcompressis, tepalis ligulatis acutiusculis, gynostemii alis medianis semiovatis, alulis obtusatis.

Pseudobulbi et folia prope Stanhopeae tigrinae Bateman. Pedunculi dense vaginati biflori. Bracteae longitudine variae nunc ovaria subaequantes. Perigonium media anthesi patulum, numquam refractum, ante et post anthesin mediam deflexum, semiclausum. Sepala oblongo triangula. Tepala oblongo ligulata acuta breviora, vulgo semitorta. Omnia intus vitellina, demum aquose cuprata; guttis multis intense atrokermesinis; extus pallida, aquosa. Hypochilium ab ungue subquadratum, antrorsum dilatatum, fundus anticus (nucha papulosa) antrorsum protensus sub mesochilio; sinu profundo ab angulo laterali superiori distentus, carina ascendens a margine summo tantum in superficiem superiorem transcendens, canalis anticus hypochilii latus, postice denticulatus, antice in lamellam obtusam extensus; cornua epichilio aequalia; epichilium a basi latiuscula extensum. subquadratum, basi superne gibbere didymo signatum. Gynostemium arcu minuto ascendens, tum cum labello parallelum; anguli apicales obtusati. Labellum et gynostemium alba, maculis parvis atropurpureis obsita.

Mexico. Ruiz Pavon! Galeotti misit vivam. (Vid. viv. c. et sic. sp. et c.)

Obs. Nuper hanc cum *Stanhopea tigrina* Bateman comparavimus, cui certe toto habitu, pedunculo bifloro etc. valde affinis. Cum tamen hic hypochilii formam strenue insecuti fuerimus, huc potius referenda visa.

β. Mesochilium bene unguiculatum.

22. STANHOPEA HASELOWIANA Rehb. fil. in Otto und Dietrich Allg. Gtz. 1855. 322 :

(Errore typographico „Haseloffiana“): hypochilio sessili recto oblongo basi non angustato; utrinque bicarinato, ante basin paulo angulato, pectore proclivi obtusato, canali profundo lato, mesochilio extenso canaliformi, epichilio ovato acuminato lateribus utrinque rectangulo replicato, tepalis oblongoligulatis acutis, gynostemii alis semioblongis dimidium inferius usque, alulis falcatis.

Spica quinqueflora. Bracteae ovarii subduplo breviores. Flores illis Stanhopeae oculatae magnae dimidio majores, longi. Sepala oblongo lanceolata acuta. Tepala lato ligulata acuta margine minute undulata. Labelli antrum antice papulis elongatis vestitum. Perigonium albidum annulis punctisque atropurpureis — demum exceptis sepalis purpureum. Ex Peruvia boreali misit de Warszewicz.

II. Hypochilium utrinque corniculo acuto antrorso auctum.

23. STANHOPEA QUADRICORNIS Lindl. Bot. Reg. XXIX. (XI.) 1838. 5;

Hypochilio basi utrinque antrorsum cornuto (more *St. eburneae*), utrinque bicarinato, pectore omnino proclivi nullo pacto arguto, canali latiusculo superficiali evanescenti, cornubus teretisubulatis, epichilio ovato acuto, tepalis cuneato ligulatis acuminatis, gynostemio superne semiligulato alato, alulis triangulis.

Flores speciosi vitellini purpureo aspersi. Hypochilium purpureo pictum, basi totum atropurpureum. Bracteae dimidio ovario subaequales. Ex America centrali allata dicitur, quae primum floruit apud dom. Rucker.

1422. GONGORA Ruiz. Pav.

Perigonii sepalum summum lanceolatum acutum, sepala lateralia trapezoideo oblonga, acuta. Tepala minuta ligulata acuminata, latere inferiori seu inferiori et superiori angulata; basin versus inserta. Labellum bene unguiculatum; hypochilium compressum, basi omnino ecornutum; latere superiori rectiusculo, plica transversa a basi antica in margine superiori in setam exeunte; epichilium brevissimum, anceps, basi conico productum, apice tridentatum, dente medio acuto producto, dentibus lateralibus nunc obtusiusculis minoribus. Flores vitellini brunneo maculati. Labellum album.

*) Sic.

III. Tepala simpliciter acuta s. apice setacea.

3. GONGORA TRUNCATA Lindl. Bot. Reg. XXIX. 1843. Misc. 52. XXXI. 1845. 56 :

Carinula per unguem in gynostemii basi, hypochilii alti setis anticis, epichilio a latiori basi acuto erecto.

Sepalum summum oblongum cuneatum acutum. Sepala lateralia obovata obliqua acuta. Tepala minutissima triangula decurrentia. Labelli unguis abbreviatus (cf. supra). Hypochilii lobi alti, subquadrati, pœstice omnino obtusanguli; plica transversa a basi antica versus marginem superiorem in aristam elongatam retrorsam exeunte; septum, quo hypochilii lobi antice confluent omnino transversum more *G. galeatae*, nec carinaeforme; epichilium cucullatum triangulum apice paulisper uncinatum. Gynostemium clavatum apice utroque angulo unidentatum. Ex Mexico allatam dicunt.

4. GONGORA SACCATA Rehb. fl. l. c. 55 :

Labelli ungue cum gynostemii pede continuo sine ulla plica, aristula hypochilii utrinque retrorsa minuta, epichilio aequilato trilobulo, lobulis lateralibus obtusis, lobulo medio dentiformi.

Praecedenti similis, recedit praeterea tepalis majoribus subsigmoideis apice aristulatis. Angulus, quem plica lateralis in aristulam excedens facit cum margine anteriori hypochilii major. Septum idem.

5. GONGORA SCAPHEPHORUS Rehb. fl. Wzw. in Seemann Bonpl. II. 98. 1854 :

Labelli ungue ante hypochilium minute plicato tuberculato, hypochilii lobis basi ligulato retrorseque auritis, antice obtusangulis minute setiferis, carina interjecta rhombea magna, epichilio compresso triangulo acuminato.

Sepalum summum ovatum acutum basi anguste cuneatum. Sepala lateralia ovata acuta latere superiori rectilinea, latere inferiori curvilinea, ergo dimidiata, tepala minuta, ligulata, acuta, deorsum incurva, latere superiori medio angulata, latere inferiori apicem versus nunc dentata, ad insertionem sepali summi adnata, sub medio gynostemio (ubi omittis pedem). Labellum unguiculatum, incurvum, ascendens, lobi laterales (hypochilii) erecti, foveam saccatam inter se gerentes, limbus superior utrinque bipartitus, portio posterior ligulata, oblique centrum floris spectans, exserta, portio anterior humilior, retusiuscula, obtusangula, apice cum portione apposita conjuncta in laminam quadratam seu rhombeam excurrans, basin versus breviter uniaristulata. Epichilium naviculare apice acutum. Perigonium brunneum fusco guttatum. Labellum superne croceum, inferne purpureum fusco guttatum. — Peru.

Gongora Scaphephorus Rehb. fl. Wswz. Rehb. fl. Bonpl. III. 218:

Hier eine neue Beschreibung nach frischen Blüten aus dem Garten des Herrn Senator Jenisch, cultivirt von Herrn Kramer. Sepalum summum ovatum acutum, cum gynostemio alte connatum; sepala lateralia oblongosemitunata late acuta basi superiori humerata. Tepala brevissima sub medio gynostemio libera semioblonga apice setaceo uncinata superne obtusangula. Labellum bene unguiculatum, curvatum. Hypochilii parietes erecti prope quadrati, angulus posticus auriculiformis, anticus semi-ovatus humilis in aristulam exiens. Epichilium naviculare apiculatum parietibus contiguis utrinque prope anceps, media linea inferiori sulcatum. Gynostemium clavatum. Androclinium retusum. Auriculae duae triangulae in margine postico; dens subulatus argutus utrinque antice in summo angulo. Rostelli medium triangulum. Blüthe gross, hellgelb, innerseits mit rothbraunen Pantherflecken, die äusserlich matt durchschimmern. Lippe gelb, mit wenig Flecken.

B. *Epichilium ligulatum acutum planum porrectum*. Tepala subbasilaria.

6. GONGORA ARMENIACA. *Acropera armeniaca* Lindl. in Paxton Flower Garden I. p. 94. Nr. 140. Xyl. 66. *Acropera cornuta* Klotzsch! in Allgem. Gartenztg. 1852. 186. Lindl. in Paxton Flower Garden III. 574. Prioribus subsimilis. Tepala arcuata aristulata profunde inserta. Hypochilii lobi humiliores apice et basi angulati (postice acute); cristula transversa humillima inter utrumque ante unguem. Septum praece-dentium. *Epichilium continuum* Ex America centrali misit vivam nob. de Warscewicz.

Huc: *Acropera armeniaca* Lindl. l. c. Cf. Walp. Ann. III. 550.

Differs from *A. Batemani* in its petals being much shorter than the column and perfectly distinct from it; and in the point of the lip being undivided, free, flat. Large flowers, colour like the sunny side of a ripe apricot.

Huc: *Acropera cornuta* Kl. l. c.:

Pseudobulbis caespitosis ovatis, apice attenuatis bifoliatis, foliis oblongis, 3—5 costatis acuminatis, basi longe attenuatis, laete viridibus, racemis basilaribus pendulis sesquipedalibus e viridi purpureis 16—20floris; bracteis lanceolatis acuminatis, perigonii foliolis externis obovatis longius apiculatis fulvis, lateralibus tortis, supremo patentissimo recto, interioribus semilunato lanceolatis brevibus, labello brevi unguiculato, serrato, apice longissime incurvo-cornuto; gynostemio albido, intus ad basin purpureopunctato, germinibus leviter striatis pedicellisque pur-purescentibus.

Farbe der *A. Loddigesii*, fahlgelb.

C. *Epichilium anceps porrectum*. Tepala mediana.

I. Hypochilii cornua basilaria infima subnulla papulas parvulas saepe evanidas referentia.

7. GONGORA BUFONIA Lindl. Bot. Reg. 1841. Tab. 2: *Gongoras irrorata* De Hoffmannsegge Verzeichnoiss 1843. 53! Cum *G. odoratissima* Lem. maxima omnium. Labello compressum. Hypochilii lobi a basi angusta ascendentes vertice sinu exciso angusto ab aristis anticis disjuncti, margine inferiori sub aristis bene angulati. *Epichilium compressum* apice bene uncinatum, basi inferiori angulatum. — Pallide purpurea, punctis guttulisque obscuris aspersa. Patriam nescio.

Huc: Lindl. l. c.:

Hypochilio convexo cornubus lateralibus obsoletis, aristis setaceis, epichilio acuminato paulo brevioribus, pedicellis columna triplo longioribus.

Brazil.

Upon comparing it with the other species of the genus already in cultivation it is found to differ not only in its singular colour, which is a dull purple, like wine-lees, in the form of very irregular stains and spots, upon a dirty yellow ground, but also in the minuter parts of its structure. It may be distinguished from *G. fulva*, maculata, and *atropurpurea* in wanting the lateral horns, which project from the sides of the lower part of the lip in these species. From *G. nigrita*, which equally wants those horns it differs in having much longer bristles, and a lip altogether longer, especially at the lower half.

II. Hypochilii cornua basilaria minuta aristularum dimidio numquam aequilonga.

1. Cornua basilaria hypochilii deflexa retrorsa.

8. GORGONA RETRORSA Rehb. fl. in Seemann Bonplandia II. 19. (1854):

Racemus pendulus. Sepalum summum lanceolatum, sepala lateralia oblonga obliqua acuta, margine inferiori obtusangula. Tepala linearia VI.

curvula, apice setacea. Labellum longius unguiculatum. Hypochilium angustum cornubus basilaribus abbreviatis retrorsis, margine superiori excisulum sinu obtuse triangulo cum arista erecta, basi aristae in lacinulam obtuse ligulatam excurrente. Epichilium anceps triangulum apice uncinatum, basi inferiori in carunculam a lobis hypochilii liberam excurrente, callo mediano ancipiti obtuso, postice descendente corniculato. Flores straminei purpureo guttulati, hypochilium concolor macula utrinque unica.

In Merida von Herrn H. Wagener entdeckt; blühte bei Herrn Consul Schiller.

8 b. GONGORA AROMATICA Rchb. fl. in Otto und Dietrich Allg. Gtz. 1854. Nr. 36:

Aff. Gongorae retrorsae hypochilio basi rotundato gynostemii basi appresso, margine superiori antice acutangulo, sinu angusto triangulo inter angulum et aristam interjecto, corniculis inferioribus baseos obtusis deflexis, medianis sinu obtusangulo a labelli ungue separatis, hypochilii basi antica in aristam antrorsam excedente, carina mediana obtuse rhombea postice apiculata, epichilio ancipiti, antrorsum acuminato, caruncula basilari inferiori semiovata transverse gyroso sulcata, sepalis extus in nervis mediis carinatis.

Obs. Cum in hac specie cornua basilaria sint deflexa, verbum „retrorsa“ in linea 1. superne auferendum.

2. Cornua basilaria hypochilii patula seu erecta.

9. GONGORA STENOGLOSSA Rchb. fl. in Seemann Bonpl. II. 93. (1854):

Hypochilio valde attenuato, ancipiti, cornubus basilaribus submedianis erecto appressis sinum magnum cum aristis efficientibus, epichilio cum carina mediana subconnato.

Racemus flaccidus multiflorus. Sepalum summum lanceolatum acutum. Sepala lateralibus ovato triangula incurva. Tepala ligulata apice subulato curvula utrinque gynostemium alato descendente, more illorum Gongorae quinquenervis Ruiz Pavon inserta. Labelli hypochilium bene unguiculatum, gracillimum, compressum, naviculare; margines superiores membranacei, antice in lobos triangulos subulatos, basi antice falcato triangulos producti; calli baseos submediani trianguli erecti. Epichilium anceps in apicem subulatum reversum extensum, basi inferne angulatum carina carnosa rhombea vertice subulata in basi. Flores straminei purpureo guttati, labellum croceum purpureo guttatam.

GONGORA STENOGLOSSA Rchb. fl. b. GRANDICORNIS Rchb. fl. Bpl. III. 218. Cornubus hypochilii altioribus, tuberculo velutino in ima basi hypochilii inter lobos magis evoluto. Aus dem Garten des Hrn. Pescatore, cultivirt von Hrn. Lüddemann.

10. GONGORA TRICOLOR Rchb. fl. in Seemann Bonpl. II. 93. (1854):

Hypochilio panduriformi fornicato, cornubus basilaribus conico tuberculiformibus patulis, ab aristis remotis, loborum margine superiori medio angulato, angulo ab acuto sinu semiovato separato, epichilio cum carina mediana connato, basi in triangulum dependens anceps extenso.

G. maculata tricolor Lindl. Bot. Reg. 1847. 69. Pagina inferiori hypochilium bene excavatum. Coloribus fulgentibus et hypochilio crasso fornicato pulcherrima.

Iluc. Bot. Reg. XXX. 1844. Misc. 30 :

Mr. Clowes received it from Liverpool, with a statement, that it came from Peru. It is a most beautiful var. of *G. maculata*. — The ground colour of every part of the flower, except the lip, is clear yellow; the column, and petals are delicately banded with rich sienna brown, and a few large clear distinct blotches of the same colour occur on the sepals. The lip itself is white with a cinnamon stain on the ends of the lateral tubercles and the sides of its upper half.

11. GONGORA NIGRITA Lindl. Bot. Reg. 1847. sub tab. 17 :

„With the colour of *G. atropurpurea*, but still deeper this has quite a different lip, not slender at the base, but rounded like *G. maculata*, and its horns are quite small; the upper part of its lip is singularly slender and bristle pointed.“

Huc: *Gongora nigrata* Lindl. B. Reg. XXV. 1839. Misc. 86:

Hypochilii convexi cornubus lateralibus ascendentibus abbreviatis aristis setaceis, epichilio acuminato apice uncinato brevior.

Much the darkest of the *G.* the flowers appearing like the deepest puce coloured velvet. It is very nearly the same as *G. atropurpurea*, but the lower half of the lip is convex, not concave, longer than the upper half, not shorter, and the horns at the sides are very short. It was imported from Demerara by S. Rucker Esq. Jun., who informs me, that the smell is quite diff. from that of *G. atropurpurea*.

12. GONGORA QUINQUENERVIS Ruiz Pav. Fl. Peruv. Syst. 227 :

Hypochilio compresso a basi supraungulari rotundato, callis ligulatis appressis seu ascendentibus, marginem hypochilii superiorem non attingentibus; sinu inter angulum anticum et aristam minuto; carina et cornu basilari epichilii ab apice hypochilii tectis.

Gongora maculata Lindl. Bot. Reg. XX. 1835. 1616. Bot. Mag. LXV. 3687. *G. fulva* Lindl. Bot. Reg. XXV. 1839. 51. *G. fulva* var. *vitellina* Lindl. Bot. Reg. XXVII. 1841. Misc. 4. *G. bufonia* var. *leucochila* Lindl. Bot. Reg. 1847. 17. *G. leucochila* Lemaire in Van Houtte Flore des Serres I. 37. (hab. ab amic. Kegel). Planta innumeris coloribus magistra esto illis, qui ex innumeris Mormodis buccinatoris coloribus tot species conflare satius ducunt, quam unam vere stabilitam circumscribere. Mirae illae sunt varietates, quae tepala lateralia margine superiori guttata, margine inferiori concoloria gerunt. Aliae gerunt hypochilia vitellina, aliae candida, epichilium et perigonium vulgo flava seu aurantiaca, nunc totum perigonium albidum. Specimen herbarii Boissieriani Pavonianum schedam gerit: „*Gongora* novum genus Fl. Peruv. Peru.“ Patria: per totam videtur Americam tropicam crescere. In Guatemala v. Warszewicz! Guatemala: insula Cativo in flumine St. Juan. 611 Friedrichsthal! (Museum Vindobonense!). Peruvia Ruiz! Ex Puerto Cabello introduxit dom. Keferstein. Ex Surinamo in hortum Houtteanum introduxit cl. Kegel.

Huc: *Gongora maculata* var. *alba* Lindl. Bot. Reg. XXVII. (1841.) Misc. 101:

Among the Orchidaceous plants received by the Hort. Soc. from Oaxaca, a singular var. of *Gongora* has made its appearance with all the habit of the original with flowers almost white, except some pale dull wine coloured spots on the sepals. It is a very graceful thing, and forms a good contrast with the old yellow and purple kind.

Huc: *Gongora fulva* Lindl. Bot. Reg. XXV. (1836) 51:

Hypochilii convexi cornubus lateralibus elongatis capitatis aristis setaceis, epichilio acuminato aequilongo, pedicellis columna triplo longioribus.

Mr. Barker sent it Jul. 36., considered it a variety of *Gongora maculata*, perhaps rightly. But at the same time, till we have a more certain knowledge of the value of O. pl., it seems necessary to distinguish it specifically. The raceme is far more contracted, in consequence of the shortness of the pedicels. Flowers are half the size; the lateral horns of the hypochile are terminated by a round dilated head.

Perigonium flavum, brunneo maculatum.

Huc: *Gongora fulva* var. *vitellina* Lindl. B. Reg. XXVII. (1841.) Misc. 4:

Bright yellow flowers less spotted than usual, and altogether of a more lively aspect. Mexico. Differs from *G. fulva* in having smaller leaves, and the upper half of the labellum distinctly shorter than the lower. It however agrees in so many other respects with that species, that I hesitate to regard it as more than a variety. Oaxaca.

13. GONGORA HISTRIONICA Rehb. fl. in Seemann Bonpl. II. 92. (1851):

Priori similis recedit hypochilii lobis basi anguste cuneatis, sinu inter angulum anticum et aristam magno, epichilio a carina libero, carina et epichilio basin usque ab hypochilio liberis.

Sepalum summum lanceolatum acutum. Sepala lateralia oblongo triangula (inferne exangulata); tepala linearia apice setacea more Gongorae maculatae inserta; labellum distincte, sed breviter unguiculatum, hypochilium anguste compressum a basi sensim ascendens, margine inferiori patenti carinatum, corniculis posticis oblique antrorsis, hypochilio ipsi non aequalibus in ima basi; margo superior curvilineus ascendens apice acutangulus antrorsus, sinum profundum amplum latum cum aristas erectis efficiens. Lacinulae inferiores lineares deflexae; epichilium carinatum, compressum, apice uncinatum, basi progredienti in carunculum a lacinulis anticis hypochilii liberam, carina integra ancipiti triangula prominula in centro.

14. GONGORA ODORATISSIMA Ch. Lemaire in Van Houtte Flore des Serres III. 229:

Recedit a praecedentibus hypochilio latissimo illi Gongorae tricoloris Rehb. fil. haud dissimili, cornubus divaricatis arcuatis hypochilii altitudine subaequilongis quasi basi cordato!

Inde huc referenda: *Gongora maculata* Lindl. in Bot. Reg. 1847. sub 17. (et eadem Lindl. in horto Ruckeriano!), sinu inter angulum et aristulam subevanido, epichilii caruncula basilari ab hypochilio semilibera. Planta valde compacta semel recognita numquam cum ulla miscenda. Variat tot coloris lusibus, quot *Gongora* quinquenervis. Huc *Gongora Jenischii* Hort., *G. Boothiana* Hort., *G. Sphepherdii* Hort., *G. vittellina* Hort., *G. quadricornis* Hort. Ex La Guayra vivam misit, quae floruit in horto Kefersteiniano amiciss. Wgener.

Obs. Diagnosin Lemairei cf. Walp. Ann. I. 783.

III. Hypochilii cornubus basilariibus basin hypochilii excedentibus aristarum dimidia longioribus.

15. GONGORA ATROPURPUREA Hook. Ex Fl. 178. Bot. Mag. 3220. *G. Heisterii* Hort.

Colore atropurpureo, hypochilio basi anguste cuneato, depresso, antice utrinque divaricato, epichilio igitur liberrimo facile distinguenda. Epichilii caruncula minuta. Ex Trinitatis insula allatam dicunt.

Species obscura.

Bot. Mag. t. 3102.

Bullet. Bot. N. 1855. p. 354: Manière, sur la sécrétion par l'organe glanduleux des Coryanthes.

Lindl. Folia I. „Oct. I. 1852.“ Monographia:

Sepala patentissima, membranacea, libera, flexuosa, conduplicata, columnae basi oblique inserta, lateralibus maximis. Petala multo minora, angusta, erecta, torta, pariter oblique inserta. Labellum cum basi columnae continuum, ab apice brachii (unguis) validi horizontalis pendulum; epichilium maximum, galeatum, deorsum (mesochilium) involutum; basi supra brachium hypochilio poculiformi subtrilobo instructum. Columna elongata, teres, clavata, abrupte recurva, apice utrinque alata,

basi cornubus 2 melliferis (staminodiis?) aucta. Stigma rima transversa. Pollinia 2, compressa, postice sulcata; caudicula lineari, sigmoidea; glandula lunata. Anthera carnosa, bilocularis; valvulis triangularibus reflexis. Herbae epiphytae Americae tropicae, pseudobulbosae. Folia nervosa. Racemi radicales, pauciflori, penduli.

This genus has the largest flowers known among Orchids; and it is, perhaps, the most extraordinary in its form. All the species are epiphytes, with long strongly-furrowed pseudobulbs, bearing thin ribbed leaves, which vary in breadth with the age and health of the plants. The flowers hang down, singly or in greater numbers, in the same manner as in *Stanhopea*, to which the genus bears some relation. Their most striking features are the column and lip, which are guarded by thin broad membranous sepals that are unable to bear their own weight, and, after a time, resemble bat's wings, soon collapsing and losing their form. The lip has the form of a bucket, into which a pair of stumps or fingers constantly distil a sweetish colourless fluid, which, drop by drop, gradually fills the bucket. The fingers are processes (perhaps abortive stamens) springing from the base of the column; the bucket is sustained by a stiff arm (unguis), which keeps it perfectly steady, so that the honey may not be spilt. The column itself turns back as if to keep its head out of the way of the drops. The use of this singular apparatus is unknown.

1. *CORYANTHES SPECIOSA*. Hooker l. c. Paxton's Fl. G. III. n. 581. fig. 284. Morren Ann. Gand. II. 15. t. 50:

C. hypochilio hemisphaerico antice pubescente ungui aequali, mesochilio eplicato intus pubescente, epichilio hemisphaerico obtuso margine erectiusculo lobis lateralibus acutis.

Gongora speciosa Hooker in Bot. Mag. t. 2755.

Wild in Brazil. On trees on Victoria Hill near Bahia.

This, the first of the *Coryanthes*, that was discovered, was originally supposed to have erect flowers, and is so represented in the „Botanical Magazine“; but in fact they are pendulous, and necessarily so, as in all the others. The flowers are pale dull yellow, without any trace of spots; there is also a whitish variety in cultivation. Their smell is rather unpleasant. It is by no means easy to distinguish this from *C. maculata*, except by the spots on the flowers of the latter species. The hood affords the surest mark of recognition, being almost exactly hemispherical in this and distinctly curved forwards in *maculata*. A variety with deeper yellow flowers is figured by Prof. Morren, in the work above quoted, under the name of *C. speciosa vitellina*.

Obs. Cl. Lindley haec omisit: *Coryanthes speciosa* var. *alba* Bot. Reg. XXVI. 1840. Misc. 75: a pale, almost white variety of this extraordinary plant has lately flowered in the collection of T. Brocklehurst, who obtained it from Demerara. The appearance of the plant is described as being intermediate between *C. macrantha* and *maculata*. — *Coryanthes speciosa* var. *Bat. Orch. Mex. Guat. 1842. 36*: Perigonium brunneum, violaceo pictum. Tepala aquose coerulea coeruleo maculata. Unguis purpurascens. Hypochilium flavum. Epichilium extus purpureum, intus pallide flavo purpureoque maculatum. — Non liquet, nonne potius ad sequentem pertinet. Cupula forsan minus exacte picta. — *Epidendrum galeatum* Vellozo Fl. Flum. IX. t. 3. — Rchb. fil.

2. *CORYANTHES MACULATA* Hooker in Bot. Mag. t. 3102:

C. hypochilio hemisphaerico galeato antice puberulo ungui aequali, mesochilio eplicato intus laevi(?), epichilio hemisphaerico obtuso margine erectiusculo lobis lateralibus acutis.

A. Sepals and petals whole-coloured pale yellow; hood yellow; bucket blotched inside with violet. — Bot. Mag. 3102.

B. Parkeri. Sepals and petals whole-coloured pale yellow; hood dull purple, bucket spotted inside with purple, and with a purple neck.

C. maculata Parkeri. Bot. Mag. t. 3747.

C. punctata. Sepals and petals bright yellow, speckled with red; hood yellow, tinted with reddish orange; bucket pale, speckled and spotted with red.—B. R. t. 1793

D. Albertinae. Sepals and petals clear yellow, with round crimson spots; hood white, spotted with rich rose; bucket very deep crimson, spotted inside. Flowers larger than usual.

C. Albertinae Karsten, Auswahl t. 1.

Wild on trunks of trees in the forests of Demerara (v. v.); Albertinae near St. Esteban in Venezuela, on trees at the foot of the Cumbre of Valencia—Karsten.

The essential difference between this and the last has been already explained. *C. Albertinae* is a variety of great beauty, but nothing more, as far as can be ascertained from Mr. Karsten's figure and description. It is cultivated in Germany, but has not yet found its way to this country.

Obs. *C. Albertinae* Karsten descr. cf. Walp. Ann. I. 784. — Eadem icon: Van Houtte Fl. Serres VIII. 755. and Pl. 1. Rchb. fil.

4. CORYANTHES MACRANTHA Hooker l. c. Lindl. in Bot. Reg. t. 1841:

C. hypochilio hemisphaerico subtrilobo antice pubescente ungue paulo brevior, mesochilio angustato plicato intus pubescente, epichilio late conico margine patulo lobis lateralibus uncinatis.

Gongora macrantha Hooker in Bot. Misc. t. 80. figure inverted.

Wild in the Caraccas. Lockhart.

Flowers rich yellow, speckled with red, with the hood of the lip and a portion of the bucket rich orange-brown. They are not half the size of *C. Feildingii*; have a hemispherical downy hood and not a broad saucershaped woolly one; the bucket too is always distinctly conical, while that of *Feildingii* is even flattened.

Obs. Adde; Pescatorea t. 29.

5. CORYANTHES FEILDINGII Lindl. in Journ. Hort. Soc. III. 15. c. ic.:

C. hypochilio subcompresso pateriformi antice tomentosio ungui aequali, mesochilio dilatato plicato et verrucoso intus tomentosio, epichilio subquadrato margine patulo lobis lateralibus uncinatis.

Wild — ? Purchased of a Nurseryman at Northampton, in 1842, by Colonel Feilding.

The general colour of the flower is a pale brownish yellow, a little mottled and stained with cinnamon in an irregular manner. When closed, it is about five inches long and three wide. As it unfolds the sepals and petals, which are membranous, turn back, seem to fold up, and finally hang drooping at the back of the lip and column. The lip is borne by a thick horizontal arm an inch and a half long, which proceeds from the top of the flower-stalk, and consequently from the lower end of the column. Right and left its base are placed two softish fleshy pale ear-like fingers. At the other end this horizontal arm expands into a convex hood, hairy in front but bald on the crown; a little compressed from the back, and two inches across in its principal diameter. From the hood hangs down a large fleshy bucket smooth at the edges, flattened at the end, two inches deep and as many wide, and connected with the hood by a hollowed fleshy stalk, which is strongly marked by various transverse fleshy folds, warts, and ridges. On the side next the column the bucket is opened, and near the bottom of the opening is furnished with three fleshy lobes, of which the sharp-pointed laterals curve downwards and the middle one stands erect, rising just high enough to come in contact with the head of the column, which grows downwards so far as almost to touch it. The column is two inches and a half long, and throws back its head till its bosom becomes so round and large as to be comparable to the breast of a „puffer“ pigeon. The head of the column divides into two short flat fleshy curved arms, between which the anther is seated.

1424. **ANGULOÆ** R. Pav.

Flor. Peruv. Prodr. 118. t. 26,

Lindl. Bot. Reg. XXX. 1544. sub 60:

Flores subglabrosi, nunquam patentes. Sepala lateralia invicem imbricantia, basi valde convexa, nec in cornu producta; alterum nunc anticum, nunc posticum, conforme, basi planum. Petala sepalo dorsali aequalia et similia. Labellum coriaceum, unguiculatum, subconvolutum, trilobum, lamina carnosata lata plana supra medium auctum, hinc quasi bilabiatum. Columna teres, clavata, libera; clinandrio nunc niutico, nunc lacinia acuta porrecta utrinque aucto. Anthera galeata, valvis membranaceis, nunc in lacinulas acutas productis. Pollinia 4, plana, inaequalia, caudicula longa lineari et glandula acuta. Herbae epiphytae Granatenses et Peruvianæ, Lycastis facie.

Lindl. l. c. sub 63: Anguloa is distinguished by its authors by a „chrysalis-shaped lip“ and the „twohorned column“. The rolled up form of the lip is common; processes of column are a very doubtful character. Pollenmasses and gland of Anguloa uniflora are not distinct from these of Lycaste Deppii. The funnel-shaped middle lobe of lip occurs in Lycaste aromatica. But that appendage is attached to the lip by the base only in Lycaste, while in Anguloa it is united by the sides also. The main difference is this: in Lycaste the lateral sepals are placed edge to edge in the manner of a true Maxillaria; but in Anguloa they overlap each other very considerably. This gives to Anguloa the look of Mormodes.

Jamieson in Hook. Lond. Journ. II. p. 658: The fine genus Anguloa, a native of the province of Loxa produces a flower, which from some fancied resemblance to a bulls head, has received the name of „el Torito.“

1. **ANGULOÆ UNIFLORA** R. Pav. Syst. 228. Bot. Reg. XXX. 1844. 60:

Pedunculo unifloro radicali squamis inflatis imbricanti vaginatis, flore bractea spathacea herbacea parum longiore; sepalis lateralibus anticis petalisque acuminatis, labelli glabri lobo medio angustissimo reflexo, lateralibus rotundatis, lamina appendiculari retusa duplo latiore, clinandrio lacinulis acutis aucto.

Mr. Barker flowered it, we believe among Linden's collections in Columbia. According to Ruiz and Pavon it is found in precipitous places about Menna and Chincao in Peru, and profusely in the wood of Tarma, where it is called „Carpalis.“

Perigonium luride album; labelli maculis quibusdam roseolis.

Fig. 2. shows the column with the two thin sharp pointed processes, which project forward; it will be remarked upon comparing this fig. with that in the centre of the flower, that there are in the latter two additional plates, looking like lappets. These bodies were missing in the first flower that we saw, and were only present in the second; they belong to the sides of the anther and are, it is to be supposed, accidental developments.

3. ANGULOA RUCKERI Lindl. B. Reg. XXXII. (1846). t. 41. Walp. Ann. I. p. 784. — Rehb. fl. Bonpl. II. 15: Caracas 5000'. März. Wagener. — *Gardn. Chronicle* 1854. 271: *Anguloa Ruckeri* var. *sanguinea*. A fine variety of this rare plant has just blossomed with Messrs. Rollisson. Instead of being yellow with blood red dots, like the original, the inside of the flower is one uniform rich chocolate brown; the terminal lobe of the lip is moreover broader, and concave, not flat. It is a fine variety of its kind (? *Anguloa Ruckeri* var. *Wagneri* Regel *Gartenflora* III. 387. Tab. 106. Num potius *A. Clowesii*? Haud adeo exacte depicta.)

1424². LYCASTE Lindl.

B. Reg. XXIX (1843). p. 14.

Flores ringentes, petalis saepius dissimilibus, in mentum breve producti. Labellum medio appendice transversa carnosa integra vel marginata auctum. Columna elongata, semiteres, saepius pilosa. Pollinia 4, per paria caudiculae angustae elongatae adnata; glandula parva subrotunda; rostello subulato.

Herbae pseudobulbosae, foliis plicatis. Scapi radicales erecti, uniflori. Flores semper speciosi bractea magna spathacea suffulti.

1. LYCASTE AROMATICA Lindl. l. c. p. 16: *Maxillaria aromatica* Hook. Ex. Fl. 219. L. O. n. 20. Bot. Reg. XXII. (1836). 1871. *Colax aromaticus* Spreng.

Pseudobulbis compressis rugosis, foliis pluribus oblongolanceolatis membranaceis, pedunculis radicalibus unifloris erectis, vaginis distantibus obtusis cucullatis, sepalis ovato-oblongis petalisque conformibus acutis, labelli semicylindranei sepalis aequali laciniis lateralibus acuminatis obtusis intermedia cuneata apice serrulata; appendice magna concava carnosa truncata, columnae facie villosa.

Mexico.

The flowers yellowish orange, scarcely spotted even inside the lip, which has two rows of hairs along its inner face.

var. *retusa* Lindl. Bot. Reg. XXX. 1844. Misc. 47:

Floribus vitellinis, labelli lobo medio dilatato reluso.

Mr. Barker Esq. received it from Lima. It differs from *L. aromatica* in having very clear yolk-of-egg-yellow flowers without a tinge of green, and the middle lobe of the lip dilated and almost twolobed.

2. LYCASTE CONSOBRINA Rehb. fl. in v. Schl. B. Z. 1852. 669:

Perigonii phyllo supremo oblongo cuneato acuto, phyllis lateralibus internis subaequalibus, latioribus, basi inferiori obtusangulis, lateralibus internis oblongis, basi cuneatis, medio dilatatis, acutis, quam phylla externa medio latioribus, glabris, labello basi naviculari excavato, elongato, phyllis externis subaequilongo, medio trilobo, lobis lateralibus ligulatis obtusis angustis, erectis, abbreviatis, callo magno supino laminaeformi acie libera antrorsa obtusato inter utrumque basesque loborum transgrediente, lobo medio producto oblongo crispulo, apice vix emarginato; gynostemio elongato, gracili, antice papillis filiformibus puberulo, labio stigmatis inferiori parvulo, lunato.

Nächst *Lycaste cochleata* Lindl., allein durch Gestalt der Lippe (kurze Seitenlappen und langen Mittellappen) sehr gut unterschieden, auch durch kahle seitliche innere Hüllblätter. — *Lycaste aromatica* hat einen am Grunde keilförmigen, kurzen Mittellappen der Lippe, die Unterlippe der Narbe ist zweizählig, die Platte auf der Lippe ist an den Seitenrändern frei. Blüten kleiner. — *Lycaste crinita* Lindl. hat längere Seitenlappen der Lippe, dieselbe und seitliche innere Hüllblätter behaart. Die Lippenplatte klein, Farbe der *Lycaste aromatica* Lindl.

3. LYCASTE CRINITA Lindl. B. Reg. XXVI. (1844). Misc. 41:

Sepalis petalisque intus crinitis, labello intus villosa alte trilobo, laciniis angustis obtusis, intermedia ovali, appendice lineari adnata; facie L. cruentae.

This is much like *L. cruenta* and has flowers of nearly the same colour; but it differs in being smaller, with the interior clothed with very long silky hairs, and in the different form of the lobes of the lip, which is moreover destitute of the crimson stain, that gives its name to *L. cruenta*. The appendix of the lip is moreover long and elevated, not very short and inconspicuous.

Lindl. Paxt. Fl. G. I. 127. sub 181:

Lip narrowly oblong, slightly speckled; lateral lobes linear, blunt, nearly as long as the equally narrow hairy oval central one; appendix is conspicuous, terminating a narrow shaggy elevation. Column long, slightly hairy. Petals very hairy. Mexico.

Petals yellow, very acute, much smaller, than greenish sepals.

4. LYCASTE COCHLEATA Lindl. l. c. 126.

Lip nearly circular, not spotted; lateral lobes long, rather acute; central flat, circular; emarginate; slightly crisp; appendix entire, as large, as the lateral lobes.

Column long, hairy. Petals hairy. Nat. — Deep orange; sepals and petals obtuse, not much smaller, than the former.

5. LYCASTE CHRYSOPTERA Morr. Ann. Gand. 232, Lindl. Paxt. Fl. G. I. c.:

Lip roundish, spotted, lateral lobes short, central lanceolate acute toothletted; appendix 3lobed. Column hairy. Petals naked. Mexico.

Deep orange yellow flowers. Seems like *L. cruenta*, but according to Professor Morren its flowers are much larger, colours more brilliant, details of lip different, appendix being 3lobed; and the middle division of the lip lanceolate, acuminate, and toothletted.

6. LYCASTE MACROBULBON Rehb. fl. Walp. Ann. I. 782. Lindl. Paxt. Fl. G. Cf. Walp. l. c. — Rehb. fl. in v. Schl. B. Z. 1852. 669:

Diese ist die *Anguloa aurantiaca* westlicher Gärten. Die von Herrn Prof. Lindley gewünschten Aufschlüsse sind folgende; innere seitliche Hüllblätter am tiefsten Grunde mit wenigen fadigen Papillen besetzt. Vorderfläche der Säule und Grund der seitlichen äusseren Hüllblätter tragen ebenfalls dergleichen Organe. Die Lippe ganz kahl.

Londini ex Sierra Nevada Marthae a Purdie missa floruit. Praeterea in horto Lindeniano ex Nova Granata.

7. LYCASTE CRUENTA Lindl. l. c. p. 16: *M. cruenta* Lindl. B. Reg. 42. t. 13:

Pedunculis raro bifloris, vaginis distantibus obtusis cucullatis, sepalis ovatis obtusis, lateralibus basi parum productis, petalis minoribus conformibus, labello sepalis duplo breviora concavo trilobo laciniis rotundatis, intermedia crispa pubescente; tuberculo parvo plano, columna pubescente.

Guatemala.

Resembles *L. aromatica*, but its leaves are broader; the flowers are 4 times as large, when in health; the lip has quite a different form, with a deep crimson blotch at its base and is not half the length of the sepals; the middle lobe is rounded, not unguiculate, and has only a small tubercle in the middle instead of the large concave appendage, that occurs in *L. aromatica*.

Huc: *Maxillaria Skinneri* Lindl. hort. (B. Reg. XXVIII. 1842. Misc. 13.). *Lycaste balsamea* A. Rich.

8. LYCASTE TETRAGONA Lindl. Bot. Reg. l. c. Misc. 64: *Maxillaria tetragona* Lindl. Bot. Reg. 1428:

Pseudobulbis ovatis tetragonis, foliis oblongo-lanceolatis plicatis solitariis, floribus radicalibus solitariis (vel racemosis), sepalis oblongis obtusis patulis, petalis conformibus paulo minoribus, labello carnoso ventricoso trilobo erecto, lobis lateralibus parvis acutis intermedio ovato extus convexo, disci appendice crassa carnosa tabulari incumbente.

Perigonium viridifuscum. Labellum intus atrovioleaceum, extus sordide album.

9. LYCASTE SKINNERI Lindl. Bot. Reg. XXIX. 1843. pg. 15: *Maxillaria Skinneri* Bat. Bot. Reg. 1842. Misc. 13:

Pseudobulbis subtundis ovatis triphyllis, foliis lanceolatis acutis plicatis scapo laxè vaginato ascendente duplo longioribus, bractea herbacea acuta cucullata ovario multo longiore, sepalis patentibus oblongo-lanceolatis acutis, petalis duplo brevioribus ovalibus erectis supra columnam convolutis apicibus reflexis; labelli trilobi lobis lateralibus erectis truncatis, intermedio longiore ovato rotundato, deflexo, appendice carnosa linguaeformi inter lacinias laterales locata; columna subtus pubescente.

The flowers measure upwards of 6" across from the tips of the lateral sepals, while the latter are nearly one and half wide in the broadest part. The sepals are pure white, faintly tinged with crimson at the base; the petals of a more rosy hue, the lip is almost covered with spots and streaks of the most brilliant carmine. The column is pure white at the apex, and mottled with crimson spots at the base; while a number of woolly hairs are scattered on its under side.

Bateman Orch. Mex. Guat. 35. — Bot. Mag. 4445. — Pescatorea 37.

10. LYCASTE DEPPII Lindl. l. c. (*Maxillaria Deppii* Lodd. Bot. Cab. 1612. B. M. 3395):

Scapo foliis brevioribus; vaginis ventricosis acuminatis, sepalis oblongo lanceolatis patentissimis, petalis minoribus oblongis undulatis conniventibus, labello cucullato trilobo apice recurvo in axi calloso margine piloso subcrenato; laciniiis lateralibus rotundatis, intermedia oblonga obtusa callo ovato.

Mexico.

Sepals green and chocolate. Petals white; Lip yellow. — DC. and A. DC. Huit. not. pl. rar. Genève. (gaudent florem triandrum tepalis nullis).

Bl. 3" Durchmesser. Gelbgrünlich. Säule fein behaart.

14. LYCASTE TRICOLOR Klotzsch Allg. Gzt. 1852. 85. *Maxillaria tricolor* Klotzsch l.c.:

Bracteis membranaceis elongatis acuminatis, convolutis, densis, viridibus, suprema ovario duplo longiore; perianthii foliolis exterioribus oblongis brevissime acutis patentibus arcuatim recurvis pallide rufescentibus, intus ad basin subvillosis, interioribus brevioribus roseis obovatis, utrinque glabris, inferne subconniventibus, apice recurvis; labello trilobo saturate roseo glabro petalis parum brevioribus, laciniis lateralibus rotundatis subinvolutis, intermedia oblonga unguiculata subrecurva, margine inciso dentata, appendice ovata marginata libera suberecta brevi ad apicem inter lacinias laterales, gynostemio candido, glabro, arcuato, ad basin internam purpurascente.

3 Hüllblätter des äussern Kreises hellbraunroth, 1½ Zoll lang, ½ Zoll breit, an der innern Basis etwas zottig; die des innern Kreises rosa. Lippe kahl, rosa, nach innen dunkler punktiert. Anhängsel tritt hier nur unterhalb der Basis des Mittellappens als 1½ Linie langer Körper auf. Guatemala. v. Warscewicz. Nauen c. Giroud.

15. LYCASTE CANDIDA Lindl. Paxt. Fl. G. II. p. 37. N. 297. xyl. 151. 152. obiter et sub falso nomine *L. leucantha* Klotzsch.

First blossoms last December, called *Lycaste candida*, small, and great varieties. Among the dwarfest of the genus, its flowers scarcely reaching higher than the lower part of the leaves. A few distant sheathing scales cloth the scape. The bract immediately beneath the flower is inflated in the middle, green, and contracted at the base and as long as the ovary, which it nearly conceals. Flowers by a curve of their slender stalk arch over, so that, when fully expanded, they present their whole face to the eyes of the observer. Sepals oblong, rolled back at the point, somewhat wavy. Petals have same form, smaller, when flower is young, roll together at the lower half, so as to form a short tube. Lip pure white, slightly trilobed, a little toothed at the edge, very concave, slightly hairy on the upper side, with a narrow, blunt, channelled appendage, lying along the middle, and not advancing more to the front, than the separation of the obscure, round, lateral lobes of the lip. Column shaggy in front. Approaches *Lycaste plana* more nearly, than any other, but differs not only in its smaller size and more delicate habit, but in the middle lobe of the lip being concave, and slightly toothed, not convex, serrated and plaited; the appendage too is linear, not toothed; and the lip itself slightly, not deeply trilobed. It belongs to that part of the genus, which is formed by *L. Skinneri*, *plana* and their allies. Central-Amerika. Warscewicz.

Huc: *Lycaste brevispatha* Klotzsch (*Maxillaria brevispatha* Klotzsch) in Berl. Allg. Gtz. 1851. Nr. 28. p. 217:

Bracteis distantibus membranaceis, aridis, fuscescentibus, superne magis inflatis, brevissime acutis, suprema ovarium vix attingente; perianthii foliolis exterioribus oblongis, patentibus apice recurvis, pallide flavido-virescentibus, intus ad basin villosulis, interioribus candidis, basi roseo tinctis, sparsimque pilosis, apice recurvis; labello petalis brevioris, albido, trilobo, glabro, laciniis lateralibus apice truncatis, intermedia oblonga, obtusa, recurva, appendice linguaeformi concava adnata, inter lacinias laterales; germine brevi, subincurvo, minutissime atropunctato.

Calcar 4 lineas longum. Perianthii foliola externa 20 lineas longa, 10 lineas lata, interiora 18 lin. longa, 10 lineas lata. Gynostemium 10 lin. longum, subincurvum, planum, pilosum, dorso concavum, glabrum. Labellum 15 lineas longum. Bractea 8—9 lineas longae. Guatemala. Warscewicz.

A *Max. (Lyc.) leucantha* Kl. differt: bracteis ovario brevioribus, labello glabro, lobis lateralibus antice truncatis.

Obs. Alia nomina: *Lycaste et Maxillaria biseriata* Klotzsch. *Lycaste et Maxillaria sordida* Klotzsch. *Lycaste et Maxillaria Lawrenceana* Hort. Angl.

16. LYCASTE SCHILLERIANA Rehb. fl. Bonpl. III. 215:

Aff. *L. fulvescenti*, tepalis obovatis acutis minutissime velutinis, sepalis duplo brevioribus, labello erecto trilobo, lobis lateralibus medianis semiovatis acutis, lobo medio porrecto ligulato minute denticulato, appendice ligulata retusa utrinque basi extrorsum arcuata, gynostemio medio villosa, basi velutino.

Bractea acuta ovario plus duplo longior. Sepala tripollicaria lanceolata acuta olivacea. Mentum parvum. Tepala et labellum alba, roseo irrorata. Gynostemium albidum, basi aurantiacum. Von Hrn. Consul Schiller aus einer englischen Auction erhalten.

17. LYCASTE GIGANTEA Lindl. in Benth. Pl. Hartw. p. 553:

Folius oblongo-lanceolatis quinquenerviis, acuminatis, scapi vaginis distantibus adpressis suprema unguiculata sepalorum longitudine, se-

palis lineari-oblongis obtusis cum apiculo, lateralibus falcatis, petalis lanceolatis brevioribus, labelli oblongi lanceolati trilobi laciniis lateralibus acutis intermedia serrata concava apice integra recurva multo brevioribus, hypochilio lineis duabus elevatis appendice emarginata.

Flores viridis 3 pollices longi. Scapus bipedalis uniflorus. Folia etiam longiora. Ad Quebrada de las Juntas. Hartweg.

Lindl. Orch. Lind. p. 21. (1846. n. 109.): Pseudobulbis very strong. Petals golden yellow. Lip red. — Forests of Merida at the height of 5000—6000'. Aug. It seems to be a variety differing in colour and large size of the flowers. — Lindl. Bot. Reg. XXIX. (1843.) p. 15: bractea herbacea sepalis subæquali, sepalis oblongo lanceolatis, labello lanceolato acuminato — —. Bot. Reg. XXX. 1844. Misc. 48: It proves to have a very different aspect from any of the species associated with it; its flowers, whose sepals are $3\frac{1}{2}$ inches long being of a warm yellowish olive and its lip a deep rich maroon bordered with orange, and looking like the finest velvet.

Huc: *Maxillaria Heynderycxii* Morr. Ann. 1845. 9:

Pseudobulbis maximis, oblongo ovoidis, glabris, compressis, marginibus obsoletis; foliis subternis oblongo-lanceolatis, acuminatis, plicatis, albo-nervosis; scapo radicali, vaginato, articulato, unifloro, pseudobulbo longiore, perigonii foliolis concoloribus, conformibus ovato-lanceolatis, obtusis; labelli trilobi lobis lateralibus elevatis, angustis, lobo medio panduriformi, reflexo, fimbriato; callo unico, sellaeformi, transverso; orbiculari, per hypochilium decurrente.

Perigonii phylla 5 brunneo flava, labellum atropurpureum. La Guayra. Funk.

Rehb. fl. Bonpl. II. 15. Caracas. Wagerer.

18. LYCASTE FULVESCENS Hook. Bot. Mag. (III. Ser. 1. Vol.) 4193:

Bractea herbacea ovario longiore, sepalis lanceolatis lateralibus falcatis, petalis conformibus paulo minoribus, labello oblongo laciniis lateralibus parvis acutis intermedia ovata obtusissima fimbriata, appendice carnosa emarginata.

Coll. of Clowes. — Flores ochraceo fulvi, labello intus rubello.

Lindl. Orch. Lind. (1846. N. 108.) p. 21: It bears also the name of *Lycaste crocea*, which I called it before it was published in Bot. Mag. — Rehb. fl. Bonpl. II. 280: Ocanna. 6000'. Maj. 763. Schlim! l. c. III. 67: Ocanna. Wagerer.

19. LYCASTE BARBIFRONS Lindl. in Tayl. Ann. Nat. Hist. XV. (1845.) p. 383:

Foliis oblongis in petiolum longum angustatis plicatis, bractea suprema angusta ovario paulo longiore, sepalis petalisque subconformibus lanceolatis falcatis lateralibus in mentum longum productis, labello oblongo basi concavo 5 lineato appendice lata emarginata adnata; lamina oblonga plana basi fimbriata apice rotundata laciniis lateralibus rotundatis, columna antice villosissima auriculis apice falcatis.

Peru (Hartweg).

Very near *L. lanipes*, but twice as large, and with long-stalked leaves. It also differs in the form of the lip, and in the shaggy column.

20. LYCASTE COSTATA Lindl. Bot. Reg. XXIX. (1843.) 15:

Bractea herbacea cucullata acuta ovario multo longiore, sepalis petalisque *L. macrophyllae* similibus, labello trilobo concavo lacinia intermedia rotundata serrata, appendice carnosa emarginata adnata 5-costata inter lacinias laterales; anthera glabra.

Peru.

Quite with the habit of *L. macrophylla*, but certainly distinct in the foregoing characters. Its colours are unknown.

Huc: *Maxillaria costata* Lindl. B. Reg. XXIV. (1838). Misc. 174:

Foliis lanceolatis plicatis scapo unifloro laxo vaginato loggioribus etc. Peru. Matthews 1026.

Huc: *Maxillaria ciliata* Pöpp. Endl. I. tab. 67.

Lycaste costata Lindl. Gardn. Chronicle 1851. 663:

This fine species originally described from a dried specimen found in Peru by Matthews, has just flowered with R. Hanbury, who received it from the Cordilleras. With the habit of *L. gigantea* it unites pure fleshy green flowers of following dimensions. Sepals $2\frac{1}{2}$ inches long by $1\frac{1}{4}$ broad, petals rather smaller; chin $\frac{3}{4}$ inches, straight, almost cylindrical, and of the same length as the ovary, which is entirely concealed by an ovate hooded green bract, which reaches about $\frac{1}{3}$ part of the dorsal sepal. The lip is yellowish white, with a roundish fringed middle lobe, half ovate acute lateral lobes, and a very conspicuous truncated ribbed white appendage. As usual in this genus the lower face of the column is shaggy, with white hairs.

21. LYCASTE LANIPES Lindl. Bot. Reg. XXIX. (1843.) pg. 15:

Bractea obtusa cucullata ovarii longitudine, sepalis petalisque oblongis elongatis, labelli laevis lobis lateralibus ovatis obtusis brevibus, intermedio oblongo obtuso basi serrato, tuberculo obtuso concavo costato glabro, columnae pede villosa.

Guayaquil.

Found by Mr. Hartweg at Paccha, a village on the Andes, in the vicinity of Loja, and sent to the Horticult. Society. It has pale green flowers, two inches and a half long before they expand, without a trace of any other colour. It differs from *L. costata* in the flowers being much larger, while the bract is not longer, than the ovary; and from *L. gigantea* in the very short bract, ribbed tubercle, and rounded not acuminate middle segment of the lip.

Huc: *Lycaste mesochlaena* Rehb. fil. v. Warscew. II. 98:

Aff. *L. barbifronti* mento elongato, tepalis lanceolatis, labelli lobo medio denticulato.

Pedunculus vaginis cucullatis acuminatis subcontiguis imbricatus, bractea summa lancea ovario multo longior; sepalum summum lanceolatum acutum; sepala lateralibus a mento subconico ovario aequali ascendente, lanceolata, acuta, falcata; tepala lanceolata acuta sepalo summo quarta parte breviora, paulo angustiora; labellum tepalis quinta parte brevius, imo pedi gynostemii adnatum linearilanceum, medio dilatatum, trilobum, lobi laterales oblique trianguli, margine postico curvilinei, lobus medius productus ovatus acutiusculus, margine denticulatus; costae 5 validae carinatae a medio ungue usque inter lobos laterales producti, ibi in appendicem obtusam medio excisam excurrentes; gynostemii frons superior ac infima nuda, pars suprabasilaris dense lanata. Blüthe wenig kleiner, als die der *L. barbifrons* Lindl., deren Tepala viel breiter, grösser; deren Kinn viel kürzer, deren Mittellappen an der Lippe gefranst ist. Peru: v. Warscewicz.

22. LYCASTE CILIATA Lindl. Herb. Mss. et Bonpl. IV. 1856. 324:

Labelli laciniis lateralibus triangulis antrorsis lobulatis, lacinia antica ovato saccata ciliata, callo basi in basin laciniae anticae ibi abrupto, ceterum quinquecostato.

23. LYCASTE REICHENBACHII Gireoud Bonpl. IV. 1856. p. 324.

24. LYCASTE BARRINGTONIAE Lindl. Bot. Reg. XXX. (1844). Misc. 51. (L. O. 147. *Maxillaria Barringtoniae* Lodd. B. Cab. 1824. *Maxillaria ciliata* Fl. Peruv. Syst. 221? Lindl. Bot. Reg. 1206):

Pseudobulbis oblongis compressis costatis, foliis subternis oblongo-lanceolatis acuminatis plicatis, scapo radicali vaginato unifloro erecto pseudobulbo vix longiore, bractea ovarii longitudine, sepalis petalisque

ovato lanceolatis obtusis, labelli trilobi lobo medio ovato rotundato fimbriato apice concavo; callo lato omnino adnato alte sulcato apice dentato.

An examination of fresh specimens of this old plant enables me to state, that it is a true *Lycaste*, readily distinguished by its stout flower stems, drooping flowers and very deeply furrowed callus. The blossoms appear to vary in colour from green to a tawny yellow.

Lönd. Journ. Bot. III, 506: Kingston Purdie.

1425. *PERISTERIA* Hook.

Bot. Mag. 3116. — Lindl. Bot. Reg. XXIX. (1843.) Misc. 99. haec:

Perianthium globosum. Sepala basi connata concava. Petala conformia, paulo minora. Labellum cum columna continuum, epichilio carnosum incumbente indiviso cum hypochilio sagittato leviter articulat. Columna erecta, semiteres, aptera cum hypochilio continua. Anthera ecristata, bilocularis. Pollinia 2, postice fissa; in glandulam linearem sessilia.

Herbae subterrestres, pseudobulbosae. Folia plicata. Scapi vaginati, radicales, multiflori. Flores speciosi.

1. *PERISTERIA ELATA* Hook. Bot. Mag. 3116. Lindl. B. Reg. XXIX. (1843.) Misc. 99:

Scapo erecto orgyali, racemo laxo elongato, epichilio rotundato serrulato medio elevato calloso, hypochilio maximo, lobis obtusis disco unidentatis columna longioribus.

Panama.

Flowers white, with lilac specks on the base of the lip. Very sweet scented. Stem some times 6' high.

Rehb. fl. Bönpl. II. 19. Truxillo. 6000'. Wagener.

2. *PERISTERIA PENDULA* Hook. B. Mag. 3479:

Scapo brevi paucifloro, columnae alis seu lobis parvis porrectis, labelli basi disco cristato crasso, lobo superiore disco canaliculato ecristato.

Perigonium pallide flavum, rubro et brunneo maculatum.

Imported from Demerara by John Allcard Esq.

Bot. Reg. XXX. (1843.) sub Misc. 99. (*P. maculata* Hort.):

Scapo brevi pendulo, racemo denso, epichilio rotundato integerrimo supra bilamellato, hypochilio elongato lobis rotundatis callo maximo lunato in medio, columna bicorni, rostello truncato. Demerara.

Flowers pale purple, spotted with lilac, with a scarcely pleasant aromatic odor.

3. *PERISTERIA CERINA* Lindl. B. Reg. XXIII. (1837.) 1953:

Scapo brevi pendulo, racemo denso, epichilio ovato emarginato crispo serrulato, hypochilii lobis brevibus acutiusculis, columna mutica, rostello truncato.

Central-Amerika.

Flowers yellow, unspotted, with the smell of bruised juniper leaves, only more aromatic.

Pseudobulbus oblongus vel ovatus, atroviridis, tripollicaris, apice folia generis oblongo lanceolata, plicata, basi vaginantia, pedalia et ultra. Scapus brevis, vaginatus, pendulus, rigidus, racemo denso, 9—10 floro, secundo onustus, sepala et petala colore et textura ceraceo lutescenti immaculata, obtusa. Labellum trilobum cum basi producta columnae articulatam, ejusque faciei appressum, lobis lateralibus ovatis,

acutis, planis, intermedio abrupte inflexo ovato, emarginato, margine crispo et croceo, ceterum colore sepalorum. Columna crassa, ovata, semiteres, aptera. Pollinia 2 biloba, in glandulam triangulam sessilia. Flores juniperum spirant.

var. *guttulata* Rehb. fil. in v. Schl. B. Z. 1852. 763: major, epichilii disco verruculoso. Ich verdanke diese Pflanze der freundlichen Mittheilung des Herrn Josst im gräflich Thun'schen Garten zu Tetschen. Derselbe hat sie in seiner „Beschreibung und Cultur der Orchideen“ p. 334. unter *Peristeria guttulata* var. *violacea* beschrieben und bemerkt, er habe sie von Hrn. Van Houute bezogen. Sie gehört aber zu *P. cerina*, weil die seitlichen Lappen der Lippe sehr entwickelt sind; auch ist die Lippenspitze ausgerandet. Die Blütenfarbe ist ochergelb mit vielen Purpurflecken, Mittellappen der Lippe stark purpurfarbig.

4. PERISTERIA GUTTATA Knowles Westc. Floral Cab. II. tb. 70. (1838):

Scapo brevi, pendulo, multifloro, racemo denso, secundo, labello dimidio inferiori disco crasso concavo, lobis lateralibus vix conspicuis, superiore ovato, margine denticulato, apice integro abrupte incurvo, intus tuberculis minutissimis obsito; columna aptera.

Flowers erect, fleshy, ventricose, of a pale salmon colour, copiously marked within and without with spots of a reddish purple or maroon colour, and emitting a powerful, peculiar and agreeable odour. Upper sepals ovate oblong, obtuse, lateral ones enlarged and tumid below, embracing and united with the base of the labellum. Labellum jointed in the middle, the upper portion or lobe erect, purplish at the apex, lying against and partly embracing the column; the inferior portion concave, with a fleshy border extending from the joint to the base of the column. Column thick, semiterete, spotted, much dilated.

Bot. Reg. XXVII. (1842.) Misc. 33: Allied to pendula, from which it differs in the colour, the shape and the smaller size of the flowers, in the absence of wings from the column, and in the scarcely developed lateral lobes of the labellum. It is much more nearly allied to *P. cerina* of the Bot. Reg., with which it agrees in the general shape of the flowers and the denticulated margin of the middle lobe of the labellum, but differs from it in the colour and copious markings of the flower, in the entire, not emarginate point of the middle lobe and in the absence of distinct lateral lobes. Still however the resemblance between them, except in colour, is so great, that we question, whether our plant may not eventually be considered a spotted variety of *P. cerina*. Said to have been imported from Rio Janeiro — but this is doubtful. Flowered with Mr. Barker.

Lindl. Bot. Reg. XXIX. (1843). sub Misc. 99:

Racemo denso pendulo, epichilio rhombeo-oblongo serrulato leviter verrucoso, hypochilio brevi lobis acutis, columna mutica, rostello brevi.

Demerara.

Flowers deeply speckled with brownish purple, on a pale dingy ground, rather agreeably sweet-scented with an aromatic resinous odour.

1425 b. **ACINETA** Lindl.

Bot. Reg. XXIX. (1843). Misc. 100.

Perianthium carnosum patulum, sepalis basi connatis supremo subscedente. Petala conformia, paulo minora. Labellum cum columna continuum carnosissimum hypochilio oblongo concavo, epichilio haud articulado tripartito ascendente, basi appendice carnosa aucto. Columna erecta utrinque in marginem latum rotundatum producta. Anthera cristata, bilocularis. Pollinia 2, postice sulcata, caudicula lineari, glandula lunata. Herbae Peristeriae habitu.

2. ACINETA SCHILLERIANA Rchb. fl.:

Simillima praecedenti, sed loco tuberculi papuliformis acuti post sellam turcicam adest tuberculum anceps transversum gibbosum.

A. Humboldtii var. *Schilleriana* Rchb. fl. Bonpl. III. 218: labelli lobo anteo recto antrorso nec mesochilio arrecto et toto labello elongato. Adsunt formae medianae cum

A. Humboldtii vulgari.

Obs. Moneo, me tum verum characterem seu non novisse, seu, quod potius crederim, ex memoria amisisse.

Rchb. fl.

3. ACINETA SELLA TURCICA Rchb. fl. in v. Schl. Bot. Z. 1852. 705:

Pedunculo pendulo laevi elongato, basi ochreato vaginato, superne florido, flexuoso, bracteis oblongis, acutiusculis, scariosis, ovaria pedicellata non aequantibus, perigonii phyllo summo ovato acuto, lateralibus externis cuneato-obovatis, hypochilio angustiori, excavato, linea erecta semicirculari limbosa a gynostemii basi separato, intus papillis filiformibus aureis sparsis velutino, versus apicem lamina lineari apice trilobula pariter aureo-velutina aucto, epichilio in hypochilii confinio inferne foveato, trilobo, lobis lateralibus reniformibus, appendice plana inferne stipitata inter utrumque, postice bicorni, antice tridentata, dente medio in carinam retrorsam exeunte (cum sella turcica in crano humano comparabili), lacinula ansaeformi utrinque inter cornu posticum et basin posticam lobi lateralis, lobo medio rhombeo, callo transverso in ima basi, gynostemio gracili dorso et facie pilis compressis aureis hirtis, alis semiovatis.

Chiriqui: Cordillerenketten. Juli. 6—8000'. *Ac. Humboldtii* Lindl. hat eine knieförmig gebogene Lippe mit keilförmigen Seitenlappen, das Anhängsel ist an den Seiten ganz frei, das Horn steht versteckt unter der hinteren Hälfte des Anhängsels. Die Säule ist kurz mit grossen knorpeligen Flügeln. — Viel näher steht *Ac. Barkeri*. Diese hat eine lange Säule mit kurzen Flügeln, die fast gerade Lippe hat unterseits dieselbe Grube, genau derselbe Plan ist befolgt: unsere Art hat etwas grössere Flügel, ganz verschiedene Seitenlappen der Lippe (dort rautenförmig, hier nierenförmig), dazu die Hörner der hinteren Sattellehne. Zwischen ihnen eine Vertiefung der Platte, bei *A. Barkeri* in Ganzen 4 kurze Zähnen in Einer Ebene. Hr. Bateman's Abbildung und Beschreibung sind unrichtig („columna aptera“, gegliederte Lippe). — *Ac. densa* Lindl. trägt Warzen auf dem Grund des Mittellappens der Lippe und hat beilförmige Seitenlappen. Dazu ist der Blütenstiel dicht mit Papillen besetzt. — *Ac. chrysantha* Lindl. (mir unbekannt) hat eine ganz viereckige Mittelplatte und ganz kleine Säulenflügel. Sie ist leider von Hr. Prof. Lindley nicht genauer beschrieben, ich entnehme das der Beschreibung des Hr. Prof. Morren (*Neippergia chr.* —). Für den Fall, dass *Peristeria longiscapa* A. Rich. et Gal. zu *Acineta* gehört, hat der Verf. bei Beschreibung der Blüthe „floribus parvulis luteolis; labello violaceo, unguiculato, trilobo“ durch das Wort „parvulis“ wohl wahrscheinlich gemacht, dass eine andere Art vorlag.

4. ACINETA ERYTHROXANTHA Rehb. fl. Bonpl. II. 92;

Aff. *A. Barkeri*: sella turcica per medium carinata, antice rectobidentata, postice quadridentata; gynostemii alis retusis, androclinio dentato.

Sepala ovalia acutiuscula, summum cucullatum; tepala oblongo cuneata acutiuscula; labelli hypochilium carnosissimum, canaliculatum, parce puberulum, utrinque medio margine involutum, ideo medio constrictum; pseudarthrosis impressa sub lobis lateralibus; sella turcica stipitata, postice dilatata, antice bidentata, interjecto denticulo sc. apice extremo apice carinae centrum ultra excurrentis ibi sub angulo recto praeruptae; postice divergenti bicorni, corniculis angularibus teretiusculis retusis margine inter utrumque corniculum obtuse bilobo, carinula transversa humillima ante sellam, papula postica obtuse triangula puberula. Lobi labelli laterales basi lata sessiles, margine antico rectiusculi, postico apicem versus dilatati, superne hinc emarginatuli, curvilinei, angulis in confinibus prope rectis; lobus medius abbreviatus excavatus, apice suo retuso trilobulus; calli loborum lateralium postici basiales carinaeformes, carinae jugum triangulum, margine superiori nunc bicrenatum; gynostemium semiteres elongatum, pronum, facie et dorso medio puberulum; alis semiellipticis retusis brevibus, androclinio dentato. Blüten erst grüngelb, dann goldgelb; Lippe und Säulengrund purpurfleckig. Im Garten des Hrn. Keferstein von Hrn. Lehmann cultivirt.

5. ACINETA CRYPTODONTA Rehb. fl. Bonpl. II. 92:

Aff. *A. chrysanthae*: sella turcica apice et postice dentata sessili, dente conico acuto sub ala sellae postica; callo infracolumnari obtuso.

Racemus abbreviatus pendulus densiflorus (17); bractee (oblongae acutae concavae ovario pedicellato breviores) ac ovaria pedicellata microscopicè nigrofurfuracea Sepala oblonga acutiuscula, lateralia obliqua ima basi subconnata, tepala oblonga acuta basi valde angustata cuneata, obliqua. Hypochilium gracile incurvum canaliculatum addito in ima basi gynostemii confinio denticulo obtuso appresso; epichilio pseudarthrosi (immobili) quasi articulado (more *A. Barkeri*, sellae turcicae) trilobo lobis lateralibus magnis trapezoides obtusangulis, basin versus angustioribus, lobo medio cuneato oblongo apice obtuse trilobo; carinula in ima basi erecta semilunari inter utriusque lobi lateralis confinia. Sella turcica sessilis elongata, dimidio anteriori apice obtuse tridentata, dentibus lateralibus extrorsis, medio retuso obsoletissime hinc quasi crenulato; carinula obliqua utrinque in marginem posticum lobi lateralis transgrediens, ante illius angulum posticum angulo obtuso desinens, dente conico elongato valido puberulo pone basin sellae in excavatione hypochilii procumbente. Gynostemium clavatum, rectum; apicem versus anguste et obtusangule alatum, margo androclini cucullatus, minute crenulatus, tota facies antica et dorsalis valde et dense puberula. *Cynoches Lindleyi* Hort. Säule weiss mit rothen Punkten und Flecken. Hülle braun. Im Garten des Hrn. Senator Jenisch von Hrn. Krämer cultivirt.

6. ACINETA CHRYSANTHA Lindl. Cf. Walp. Ann. III. 547. l. c. Lindl. l. c.:

Flowers size of *A. Barkeri*; erect racemes, bright golden flowers; racemes height a foot. Loaded closely with gold yellow blossoms, each more than 17½ lines wide, very like these of *A. Barkeri* exc. in colour. The lip appears to be white, column crimson. At eight the flowers are very aromatic. From other *Acinetas* it is distinguished by the presence of a long blunt, papillose horn arising from the hypochil. Ann. Gand. t. 282. We do not feel certain, that the erect position of the raceme is habitual with this plant, for according to the drawing, while one raceme rises upright, another is bent downwards as in *Acineta*.

7. ACINETA Densa Lindl. cf. Walp. Ann. III. 546. Lindl. l. c.:

Flowers pale yellow, externally spotted with crimson, lip yellow, with deep crimson; hypochil more concave than *A. Barkeri*, the tooth of which is not notched at the point; an entire epichil remarkably warted at the base, and the lateral lobes of

metachil not at all rounded with the posterior angles of the internal appendage sinus and not extended into a long subulate process.

Huc: *Acineta Warscewiczii* Klotzsch Allg. Gtz. 1852. 145

Pseudobulbis ovatooblongis, compressiusculis, leviter sulcatis, apice 3—4foliatis, foliis maximis, late lanceolatis, subplicatis, utrinque attenuatis, scapo basilari pendulo multifloro, floribus carnosulis, pallide cerninis, apertis, perigonii foliolis exterioribus impunctatis, brevissime acutis, extus convexis, duobus inferioribus oblique ovatis, supremo elliptico, duobus interioribus aequilongis obovatis, obtusis, basi attenuatis, intus puberulo rubro punctatis, labello cum columna continuo, crasso, carnososo, hypochilio oblongo concavo, intus puberulo, rubro punctato, extus ad apicem umbilicato, epichilio exarticulato, tripartito, ascendente basi appendice callosa atropurpurea, 4 angulata, longitudinaliter unicostata, apice truncata, inflexa, lobis lateralibus latis, truncatis, erectis, intus rubropunctatis, intermedio aureo, obovato, plano, patenti, columna elongata subcurvata, albida dorso pilosa, intus versus basin rubro punctata, alis subangustis.

Central-America. v. Warscewicz. Mathieu.

8. ACINETA BARKERI Lindl. Bot. Reg. XXIX. (1843). Misc. 100:

Petalis sepalis aequalibus, callo labelli duplici inferiore subhastato apice tridentato basi multidentato, lacinia intermedia emarginata, lateralibus acinaciformibus, columna elongata alis angustioribus.

Mexico.

Scape long, pendulous, lax, many-flowered. Flowers yellow, whole-coloured. The lip has certainly no articulation in the middle, although from Mrs. Withers fig. in Mr. Bateman's splendid plate such would seem to be the case.

Peristeria Barkeri Bateman Orch. Mex. Guat. tab. 8:

Pseudobulbis ovatis, profunde sulcatis, 3—4 phyllis, scapis pendulis multifloris, foliis subaequalibus, floribus carnosis fere clausis, sepalis petalisque subaequalibus concavis obtusis, labelli trilobi lobis lateralibus integris erectis, intermedio angustiore basi calloso; columna aptera leviter pubescente.

Mexico: Kalapa. Ross. — Bot. Mag. 4203. — Cf. Walp. Ann. III. 547.

1425. ^{3/} **LYCOMORMIUM** Rehb. fl.

v. Schl. B. Z. 1852. p. 833,

Flores postici: perigonium carnosum, externum ima basi connatum. Phylum summum oblongum, obtusum, obtusiusculo attenuatum, concavum, lateralia externa in gynostemii pede, triangulo attenuata, gynostemium versus descendentia; lateralia interna lanceolata, apice attenuata, falcato curvata, basin labelli versus ascendentia. Labellum cum pede gynostemii continuum, nec articulatum, angulatum, cochleari-excavatum (margines laterales curvilinei) apice trilobum, lobi laterales trianguli, obtusi, erecti, lobus medius carnosissimus, triangulus, minutus, rostrato inflexus; medio profunde canaliculatus, in utroque sulci margine alte carinatus, pone carinas extrorsum sulcatus, fundo canalis nunc carinulato. Gynostemium breve, carnosissimum, dorso recurvum, ante apicem intrusum, utrinque aequaliter alato-marginatum, androclinium perpendiculare, breviter marginatum, rostellum trilobum, supra stigma lineare transversum pendulum. Anthera carnosissima, oblonga, fronte

transverse angulata, antice ligulata, biloba, magis membranacea, postice et inferne in dentem carnosum acutissimum longum geminum, antrorsum (vestigia paginae inferioris!) excurrens. Pollinia oblonga cuneata, depressa (?), per paria incumbentia, sessilia in glandula oblonga, antice acuta biloba. Gynostemii pes angulatus cum gynostemio et cum labello canaliculatus, a labelli lobis lateralibus (Peristeriaceis) nudus.

1. LYCOMORMIUM SQUALIDUM Rehb. fil. l. c. (*Anguloa squalida* Endl. Pöpp. Nov. Gen. et Sp. I. 74):

Diese ist die vierte Gattung in der kleinen Gruppe der Peristerien. Sie steht Peristeria zunächst und zeichnet sich durch die mangelnde Gliederung der Lippe und die wunderbare Anthere sehr aus.

Lindl. Bot. Reg. XXX. (1844) sub 63. What *Anguloa squalida* of Pöppig may be, I cannot say. I have never seen the plant, and the barbarous analyses given by that author preclude all hope of coming to any conclusion about it. It may however be safely asserted, that no such plant exists, as is represented by Mr. Pöppig.

1425⁴. **LACAENA** Lindl.

Bot. Reg. XXIX. (1843.) Misc. 101.

Perianthium carnosum, patens, sepalis subaequalibus basi subconatis. Petala conformia minora. Labellum cum columna et in medio articulatum, hypochilio unguiculato cuneato bilobo apice pulvinate, epichilio integro. Columna erecta semiteres. Pollinia 2, postice fissa, caudicula setacea, glandula minuta.

Herba Peristeriae habitu.

Bot. Reg. XXX. 1844. 50: *Lacaena* was one of the names of Helen, and may be applied to this plant because of its beauty; but it may also be derived from $\Delta\alpha\alpha\eta$, a cleft, in allusion to the divisions of its lip.

1. LACAENA BICOLOR Lindl. Bot. Reg. XXIX. (1843) sub Misc. 101:

Guatemala. — Racemes long, drooping. Flowers pale yellow, with the lip spotted with dark purple. — Bot. Reg. XXX. 50: This fine plant was sent to the Horticultural Society from Guatemala by Mr. Hartweg, who found it in the mountains of Salama, in the province of Vera Paz, also near the village of Sunil, near Quetzaltenango in Guatemala, growing on rocks, at an elevation of about 7000' above the sea.

Huc: *Peristeria longiscapa* Rich. et Gal. tab. 30. Annales sc. nat. 1845. Janv. p. 25.

Pseudobulbis ovoideis obtuse costatis 2phyllis; foliis maximis elliptico-lanceolatis, scapo radicali dependente; floribus parvulis luteolis, labello violaceo unguiculato trilobo. Mexico.

2. LACAENA SPECTABILIS Rehb. fil. Bonpl. II. 92:

Affinis *L. bicolori*. Labello angustiori basi melius et anguste unguiculato, lobo medio anguste unguiculato pandurato acuto, callo inter lobos laterales cylindraceoconico basi antice foveolato minute velutino; perigonio lilacino.

Ovarium et sepala externe minute muriculata. Sepala oblonga obtuse acuta. Tepala oblonga utrinque basin versus obtusangula, hinc cuneata. Labellum exactissime typum illius *L. bicoloris* refert: basi unguiculatum, dein trilobum, lobis obtusangulis erectis, auricula utrinque minuta obtusa erecta ante unguem (quae in *L. bicolori* reperitur!); cornu supra descriptum a carina disci ascendens; lobus medius superne minute punctulato velutinus. Gynostemium a lateribus paulo compressum et androcinium bene marginatum.

Huc: *Nauenia* Klotzsch in Otto und Dietrich Allg. Gtz. 1853. 193:

Perianthium galeatum apertum, foliis tribus exterioribus ima basi connatis. Phyllum summum oblongum acutum concavum apice recurvum; lateralia interiora minora obliqua gynostemii pede inserta. Labellum cum pede gynostemii continuum articulatum patens trilobum; hypochilio oblongo versus apicem bilobo (lobis rotundatis erectis), processu galeato antice excavato interjecto; metachilio nullo; epichilio subquadrato, basi dilatato truncato, longiuscule unguiculato cum hypochilio continuo. Columna arcuata, semiteres, alato-marginata, labello paulo brevior. Anthera bilocularis depressa. Pollinia 2, postice fissa, caudicula lineari in glandulam strictam acutam elongata.

Herba epiphyta pseudo-bulbosa centro-americana facie Lacaenae. Pseudo-bulbi majores elongati costati apice attenuati 2—3 foliati. Scapi radicales longissimi penulsi multiflori minutissime atro-punctati. Flores speciosi dilute lilacini intus minutissime violaceo-punctulati. Columna albida basi viridis. Epichilium minutissime atro-purpureo punctatum.

Nauenia spectabilis Klotzsch l. c.:

Pseudo-bulbis elongatis obpyriformibus 8—10 costatis 2—3 foliatis; foliis robustis atro-viridibus anguste oblongis nervosis utrinque attenuatis, versus basin distanter fusco arido vaginato-bracteatis; bracteis floralibus sessilibus ovato-lanceolatis concavis coloratis germine subduplo brevioribus; floribus magnitudine florum Lacaenae bicoloris.

1425 ⁵/₁. **KEGELIA** Rehb. fil.

v. Schl. B. Z. 1852. 660.

Perigonii phylla 5 lanceolata, acuminata. Labellum unguiculatum, trilobum, medio calloso-cristatum. Gynostemium apus (sc. non productum). Macradeniae affine visum gynostemii fabrica longissime distat. Et valde mirum, quod insolito inter Vandeas more perigonia externa extus, pedunculum, vaginas, ovaria papillis filiformibus acutis atrofuscis vestita gerit.

Dicavi amicissimo Kegel, hortulano universitatis Halensis speciemque inscripsi hortulano meritissimo Van Houtte, ut mira ac elegans haec plantula combinata generet nomina virorum, qui concordia ac amicitia juncti quam maxime et de hortis et de botanica arte meruerunt.

1. **KEGELIA HOUTTEANA** Rehb. fil. l. c.:

Ich sah eine einzige Aehre mit vier Blüten, welche denen der *Cirrhaea Loddigesi* gleich gross sind. Der Blütenstiel scheint hängend gewesen zu sein. Die Deckblätter trockenhäutig, länglich, spitz, so lang wie die Fruchtknoten. Die äusseren Hüllblätter länglich; allmählich zugespitzt, wohl olivengrün, die inneren von keilförmigem Grunde ausgebreitet, dann zugespitzt, weiss, mit 2—3 Purpurflecken. Der Nagel der Lippe gekielt in der Mitte. Die seitlichen Lappen ziemlich rautenförmig, der mittlere ziemlich dreieckig, mit stumpfen Seitenwinkeln, in der Mitte nur verbunden mit den Seitenlappen, zwischen denen eine aufrechte, schief rautenförmige oberwärts gefurchte, schmale, nur am unteren Grunde angewachsene Leiste weiss. Säule länger als Lippe, unten schlank, nach oben stärker. — Vom Herrn Universitätsgärtner Kegel in Surinam entdeckt. Blühte bei Hrn. Van Houtte.

Die auf *Metampodium? ruderale* begründete *Kegelia* ist leider zu *Unxia* zurückgeführt worden. (Miquel in Haarlem naturhist. Verhandl.) *Xenia* Orchid. p. 45. Tab. 25. I. 1—7.

1425⁶. **SCHLIMIA** *Planch. Lind.*
(*Lind. Cat.* 1852.) — *Pact. Fl. G. III.* 115. N. 581.

Sepala carnosia inaequalia, dorsale lineare, rectum, liberum, lateralia maxima in saccum altum omnino connata. Petala sepalo dorsali aequalia, reflexa. Labellum minutum, ungue carnosio cum pede columnae articulado tuberculato, limbo simplici membranaceo duplo brevior. Columna semiteres, apice utrinque auriculata, in pedem cum sepalis lateralibus connatum producta, rostello setaceo deflexo. Pollinia 2, cereacea, caudicula elongata cuneata, glandula minuta lunata.

Lip is a fleshy body, shorter than the column, and articulated with it, with three knobs near the foot of the column, another in the middle of its length, and a fourth which is concave at its extremity, which is prolonged into a thin trowelshaped limb.

1. **SCHLIMIA JASMINODORA** *Planch. Lind. l. c. c. xyl.* 287:

Genre nouveau des plus curieux, à sépales inférieurs soudés ensemble et formant un sac ressemblant à ceux des *Cypripedium*. L'espèce en question porte une hampe inclinée de huit, à dix pouces, garnie de 10—15 fleurs d'un blanc pur, à odeur du jasmin fortement prononcé. Elle croit épiphyte et terrestre dans les forêts de la province d'Ocanna où elle a été découverte par M. Schlim.

Rehb. fl. Bonpl. II. 281. Ocanna. 6—7000'. Mai. Nr. 773. Schlim.

2. **SCHLIMIA ALPINA** *Rehb. fl. Warscew. Bonpl. II.* 98:

Labelli lamina callo suo plus duplo longiori pandurato acuto (nec aequilongo triangulo); gynostemii alis dolabriformibus (nec triangulis), callo infracolumnari quinquelobo regulari (nec gyroso lobulato incrassato); anthera apice bidentata (nec retusa). Racemus multiflorus pendulus; bractea obtuse acutiusculae ovaria pedicellata dimidio aequantes, sepalum summum oblongum acutiusculum cuneatum, sepala lateralia in saccum amplum medio ostio acutiusculum connata, tepala linearia apicem versus dilatata acuta, labellum cum ima basi pedis producti gynostemii continuum, linea curva ascendens, bipartitum, hypochilium corneum quinquelobum, lobi laterales ligulati abbreviati antrorsi, lobus medius cyathiformis, margine lobulato; epichilium panduratum acutum membranaceum; gynostemii pars superior brevis, utrinque dolabriformi alata, androclinium in rostellum longum lineare apiculatum deflexum productum, fovea stigmatica ovalis sub processu rostellari; in pede gynostemii tuberculum cum tuberculis utrinque duobus lateralibus, more *Acinetae*.

Blüthen schwefelgelb mit rothen Punkten innerlich, um mehr als ein Drittheil grösser, als die der *Schlimia jasminodora* Linden Planchon, einer verbreiteten Gartenpflanze. — *Schlimia* ist eben so wenig eine *Cryptochileae*, als die *Cryptochileae* Vandéae. — Wir halten *Schlimia* für eine noch ganz vereinzelte Form. Zu entdeckende Mittelglieder werden höchst wahrscheinlich den Uebergang zu den *Peristeriaceae* vermitteln. — Neu-Granada. 9—10,000'. v. Warscewicz.

1425⁷. **PAPHINIA** *Lindl.*
Bot. Reg. XXIX. (1843). p. 14.

Flores subregulares, expansi petaloidei, parum in mentum producti. Labellum parvum, unguiculatum, tripartitum, glandulis filiformibus apice oblique obsitum. Columna clavata, elongata, semiteres, apice auriculata. Pollinia 4, per paria caudiculae elongatae apice setaceae affixa, glandula

minute subtriangulari; rostello subulato. — Herba pseudobulbosa, scapo pendulo paucifloro.

1. PAPHINIA CRISTATA Lindl. l. c. *Maxillaria cristata* Lindl. in Bot. Reg. XXI. (1836). 1811:

Flores pulcherrimi extus albi, intus purpureo interrupte fasciati; petalis apice omnino purpureis. — Trinidad and Guayana. — Bot. Mag. 4836. — V. H. Flore des Serres IV. 338.

1425⁸. **HOULLETIA** A. Brogn.

Ann. Sc. nat. sec. Ser. XV. 1841. 36. — Bot. Reg. XXVI. (1841.) Misc. 99:

Perianthium membranaceum patens (non reflexum). Sepala concava, libera, inferioribus vix basi columnae connatis. Petala basi angustata, unguiculata, apice rotundata. Labellum cum basi incurvata columnae articulatam liberum carnosum, medio constrictum, articulatam, parte basilari (hypochilio) oblonga plana, lobis seu processibus lateralibus membranaceis angustis retrorsum arcuatis corniformibus, parte apicalari (epichilio) infra basilarem articulatam integra. — Columna perianthio brevior arcuata semiteres, antice plana, vix superne alato-marginata. Stigma transverse excavatum. Anthera opercularis depressa; pollinia duo oblonga angusta, externe sulcata, caudicula membranacea oblonga basi connata, glandula angusta lanceolata.

Epiphyta, pseudobulbis ovato conicis, monophyllis, foliis longissime petiolatis, plicatis, membranaceis, scapo radicali ascendente, floribus racemosis nutantibus, ovario plus minusve contorto, perianthio membranaceo pallide maculato, fragrante, labello, carnosum maculis atro-violaceis insperso, levem odorem stercoreum olente.

Mr. A. Brogniart considers it near *Stanhopea* from which it differs in its sepals not being reflexed, its lip articulated in the middle, the lower half bearing two membranous horns directed backwards and upwards towards the column, by the column being short and not membranous at the edge, by the petals having a stalk, by the lanceolate form of the gland of the pollenmasses, and by the flowering stem being erect, not pendulous. Upon considering these characters it is evident that *Houletia* is either the same as *Maxillaria*? *Brocklehurstiana*, already mentioned in this vol. p. 10. n. 28, or a plant very nearly related to it. As the genus is no doubt a good one, it will be necessary to change the name of my species to *Houletia Brocklehurstiana*.

Sert. 43: Perianthium patens, sepalis subliberis, petalis paulo minoribus unguiculatis. Labellum basi columnae continuum, patens; hypochilio angusto, basi excavato, quasi bilabiato, apice utrinque in laciniam producto, lobulo nano interjecto; metachilio nullo; epichilio angulari dilatato cum hypochilio articulado. Columna erecta, arcuata, clavata, semiteres, labello paulo brevior. Anthera bilocularis depressa. Pollinia 2, postice fissa, caudicula lineari-lanceolata in glandulam acutam elongata nec inflata. — Herbae epiphytae, pseudobulbosae, Americae aequinoctialis, foliis solitariis plicatis. Scapi radicales, erecti, apice racemosi. Flores speciosi, luteo-fusci; bracteae parvis nec spathaceis.

a. Pedunculus erectus.

1. HOULLETIA BROCKLEHURSTIANA Lindl. Bot. Reg. XXVII. (1841.) Misc. 99. Huc *Maxillaria*? *Brocklehurstiana* Lindl. Bot. Reg. l. c. p. 10. Misc. 28:

Foliis solitariis oblongo-lanceolatis longipetiolatis plicatis scapo multifloro brevioribus, sepalis patentibus oblongis, inferioribus paulo connatis, apice rotundatis, petalis angustioribus basi angustatis, labello membra-

naceo tripartito: laciniis lateralibus linearibus acuminatis reflexis, intermedia ovato-triangulari subhaslata, columna basi infundibulari depressa.

Charming! Imp. from Rio Janeiro by T. Brocklehurst Esq. of the Fence near Macklesfield. It has a scape a foot and a half high, terminated by several rich cinnamon — brown spotted flowers, more than 2" diam. and deliciously sweet. It has the habit of *M. Warreana* and is one of the finest species of the genus. It may indeed be doubted, whether it really belongs to *Maxillaria* and characters may doubtless be found to separate it. I am however averse to making genera in the *Maxillardius* group of *Vandeae*, until a larger number shall have been examined in a living state,

Lindl. Sert. 43:

„*Hypochilii laciniis lineari-lanceolatis reflexis, epichilio ovato-triangulari subhaslato angulis lateralibus acuminatis.*

Near Stanhopea, but hypochil is not concave, on the contrary it is flat, with a funnel-shaped hollow at its base. Flowers $3\frac{1}{2}$ " diam., spread out so as to form a somewhat concave perianth richly spotted with brown upon a cinnamon-coloured ground. In texture they are leathery and firm. Sepals oblong, rather obtuse; lateral being very slightly united at the base and somewhat larger than that at the back. Petals rather shorter, much narrower, obovate and narrowed at the base into a claw. Lip consists of a hypochil or lower and an epichile or upper half, with no intervening portion; it is continuous with the base of the column and rather shorter than lateral sepals. Hypochil is narrow, flat, spotted with brown, hollowed out next the foot of the column into a kind of 2 lipped funnel, from its anterior end spring 2 long, linear lanceolate taper pointed appendages, which turn back towards the column, reaching almost half way up it, just at the junction of the hypochil and epichil, and between those appendages is a minute reflexed fleshy tooth, such as is found in the same situation in *Stanhopea*. Epichil is broader than the last, with which it is articulated; in colour it is a deep rich violet, in form somewhat triangular with curved sides and at the lower angles it is extended into a very narrow acuminate appendage, so that upon the whole it has sometimes the form technically called hastate. Column curved, rounded at the back, slightly concave, in front thicker at the upper, than the lower end. Pollenmasses deeply 2 lobed at the back, planted on the end of a long narrow caudicula, which runs into an acute gland in such a manner, that the 2 are completely blended together.“ — *Houlletia stapeliaeflora* Brogn. — *Pescatorea* 34. — *B. Mag.* 4072.

2. *HOULLETIA PICTA* Lind. und Rehb. fl. in Regel *Gartenflora* 1855. 2:

Affinis *H. Brocklehurstiana* Lindl. (stapelioidi Brogn.) paulo minor, epichilii semiovati acutiusculi angulis posticis retrorsis subfalcatis, hypochilii callo in foveam transversam utrinque aculam marginalam exeunte, dente introrso medio antico, cornubus haud supra apicem hypochilii coalitis (more *H. odoratissimae* Linden).

Blüthenhülle schön rothbraun mit ungleichen Schattirungen. Lippe weisslich mit etwas violetter Säule, stärker hautfüglig. als bei der gemeinen *H. Brocklehurstiana*. Es ist sonderbar, dass diese Art völlig geruchlos scheint, während jene Art und *H. odoratissima*, welche beiden ein Mittelglied bildet, stark riechen. Erstre hat täuschenden Geruch von Zimmt und Gewürznelken. — Neu-Granada; von Schlim entdeckt.

3. *HOULLETIA ODORATISSIMA* Linden Paxt. Fl. G. III. 172:

Scapo stricto, sepalis liberis, petalis conformibus indivisis, labelli epichilio unguiculato ovato obtuso subsagittato undique intra marginem verrucoso angulis posticis obtusis, mesochilio dente longo linguiformi apice acuto, cirrhis ascendentibus falcatis columna brevioribus, hypochilio appendice pedicellata cyathiformi aucto.

Ocanna. Neu-Granada. Schlim. Mai 1851, on the borders of rivulets. Its extremely aromatic odour discovered its presence at a considerable distance, on which

account Mr. Linden calls it *H. odoratissima*. The pseudobulbs are described as resembling those of the Brazilian *Houletia*, but being more blunt. The flowers are brick-red, both the lip and column white.

Pescatorea t. 3. — Rehb. fl. Bonpl. II. 281. — Ocanna. 4—5000'. Juli. Nr. 37. Schl.

b. *Pedunculus pendulus*.

4. *HOULLETIA TIGRINA* Linden. Lindl. in Paxt. Fl. G. III. 172:

Scapo decurvo, sepalis alte connatis, petalis acutissime trilobis, labelli epichilio sessili ovato obtuso apiculato, hastato, versus basin verrucoso angulis posticis acuminatis, mesochilio apice carnosum in tuberculum infundibulare elevatum cirrhifasciculatis falcatis columna brevioribus, hypochilio carnosissimo basi excavato semibiloculari.

Wild on the ground in New-Granada, in the province of Ocanna, growing in forests of *Weinmannia*, where it was found by Mr. Schlim, one of Mr. Linden's collectors, in June and July, 1851, at an elevation of 4800 feet. — The leaves are broad, plaited, erect, almost two feet long, and look like those of a vigorous *Stanhopea*. The stem appears to be about as thick as a swans quill, greenish red, slightly dotted with brown. The flowers are four inches in diameter, and of the firm texture of *Stanhopeas*. The sepals are oblong, concave, straw-colour, very richly mottled and variegated with deep rose. The petals are one inch and three-quarters long, very acute, with a strong sharp-pointed lobe on each side, brilliant yellow variegated with rich crimson in the same way as the blade; the latter is yellowish at the point, otherwise whitish speckled all over with crimson; the stalk is richly marked with cross bands of blood-red, and has on either side a process shaped like a scythe blade which rises up in the direction of the anther. The column is dull yellow speckled with purple. After such an account it is only necessary to say, that Mr. Linden has this noble plant on sale, and that the character of *Houletia* as a genus distinct from *Stanhopea* is placed in jeopardy.

5. *HOULLETIA LANSBERGII* Lind. Rehb. fl. in Regel Gartenflora 1855. p. 2:

Aff. *H. pictae* Linden, biflora, sepalis angustioribus, tepalis cuneato oblongis, margine superiori prope medio acutangulo.

Diese Art ist eine fast ebenbürtige Schwester der prächtigen *H. picta* Lind. (*Paphinia picta* Lind.), deren Bild für die *Pescatorea* vollendet vorliegt. Sie zeichnet sich aus durch oben mehr eingeschnürte kurze Pseudobulben. Hängend wie bei jener erscheint der dreischeidige Blütenstiel mit seinen zwei wunderbaren Blüten, die sich jedoch nie gänzlich zu öffnen scheinen. Der Grundton der Sepalen und Tepalen ist ein helles Gelb mit rötlichen Tinten. Zahlreiche lackfarbige Pantherflecken sind über sie ausgegossen, hellere innerseits der Sepalen, dunklere auf den Tepalen, ganz besonders auf dem Unterrande derselben. Die Hinterlippe bildet eine längliche aufsteigende Schwiele, welche am Ende eine längliche Höhlung besitzt. Nach vorn flacht sie sich in eine zweilippige Spitze aus, welche dem Grunde der Vorderlippe aufliegt, die sichelförmigen seitlichen Hörner treten auch hier nicht zusammen, die Vorderlippe selbst ist streng spießförmig, vorn stumpf. Ihre Scheibenfläche ist mit zahlreichen Runzeln besetzt. Die Hauptfarbe dieses Organs ist weiss, das Vorderstück gelblich, zahlreiche Purpurflecken erhöhen ihre Schönheit. Säule weisslich mit hellbraunen Flecken; ziemlich lang für eine *Houletia*.

Rehb. fl. Bonpl. II. 19. *Houletia tigrina* Linden? Die Pflanze stimmt völlig in allen Einzelheiten, nur sind zwei Dinge zu erwähnen, die Tepala tragen auf dem Oberrande zwar einen dreieckigen sehr fein gespitzen Lappen gegen den Grund, allein der Unterrand ist ganz unversehrt. Ferner erwähnt Herr Prof. Lindley nicht, dass jenes Stück des Hypochiliums, welches vertieft und durch eine von hinten nach vorn gehende Längleiste halb getheilt ist, nach dem Fusse der Lippe zu jäh abstürzt (postice abrupte decisum). Jedenfalls erhalte ich die authentische Pflanze aus

einem unserer Gärten baldigst und werde dann meine Zweifel gelöst sehen. Cumana. 4000'. October. Wagener.

1425/q. **POLYCYCNIS** Rehb. fl.

(Pescatorea obiter). Bonpl. III. 218.

Genus valde affine Gongorae: sepalo dorsali libero, et labelli explanati hypochilio in epichilium imposito. Sepala lanceolata. Tepala linearilanceolata; omnia liberima. Labellum unguiculatum medio carinatum. Gynostemium gracillimum arcuatum apice dilatatum circa foveam minutam ampliatum. Rostelli processus medius quadratulus apice bidentatus. Pollinia linearia in caudicula lineari pandurata. Habitus Gongorae. — Genus ab amico cl. Wendland fil. feliciter auguratum.

1. **POLYCYCNIS MUSCIFERA** Rehb. fil. l. c. (*Cyenochea musciferum* Lindl. Paxt. Flow. G. III. 29):

Ungue basi bifalcato, epichilio utrinque acutangulo medio antice acuto. Ovarium velutinum.

Neu-Granada Lansberg Ic. ! Warscewicz!

Huc: *Cyenochea musciferum* Lindl. Paxt. Fl. G. III. 28. n. 500 c. xyl. 248:

Racemo laxo stricto, bracteis subulatis, sepalis linearilanceolatis acutis, dorsali refracto, petalis linearibus, labello membranaceo hastato; laciniis lateralibus ascendentibus intermedia basi rhombea saccata in apicem linguiformem attenuata. Columbia.

2. **POLYCYCNIS BARBATA** (*C. barbatum* Lindl. Hort. Soc. B. M. 4479) Rehb. fil. l. c. (ungue basi mutico?):

Epichilio utrinque obtusangulo, antice mutico.

Lindl. Hort. Soc. Journ. IV. 268. 1849.

Racemo ascendente longissimo (bipedali) multifloro (50—80), labelli trilobi basi barbati laciniis lateralibus erectis triangularibus acuminatis inaequilateris, intermedia rhombeolanceolata acuminata, ovario hirsuto.

Neu-Granada. Linden. Pseudobulbs of Gongora. Flowers soft delicate flesh colour spotted with deeper red. Whole of parts are so thin, as almost to deserve the name of membranous and in the middle of the three-lobed stalked lip is a broad tuft of long half-transparent hairs.

Hook. B. M. 4479:

Pseudobulbo ovato compresso demum nudo apice folioso, folio solitario elliptico oblongo utrinque attenuato plicato, racemo radicali longe pedunculato, pedunculo ovarisque pilosis, sepalis petalisque conformibus lanceolatis patentissimis, labelli facie superiore barbata, hypochilio alto lato, epichilio cordato-ovato obscure trilobo subreflexo. Costa-Rica.

Lindl. Paxt. Fl. I. p. 45: A singular and handsome plant, which appears to connect Gongora with this sportive genus. A young plant scarcely exhibits a pseudobulb at all, only several imbricating leafy scales terminated by an oblong-oval, acuminate plaited leaf. When this leaf is fully developed, the almost naked pseudobulbs appear ovate, compressed, green, smooth, with the withered scales at the base. Scape from the base of the pseudobulb, a foot long, dark purple pubescent, pointed, sheathed with scales at all joints; this is terminated by a drooping many flowered raceme, a foot long, of which the rachis and pedicel — like ovaries are dark purple, hairy. Flowers modically large, at first sight a good deal of Gongora maculata. Costa-Rica.

3. **POLYCYCNIS VITTATA** Rehb. fil. Mss. *Houlletia vittata* Lindl. B. Reg. XXVII. 1841. Misc. 100. tab. 69:

Sepalis linearibus acutis, petalis lineari-lanceolatis basi tortis, hypochilii lobis ovatis obtusis rectis, epichilio rhombeo apice rotundato angulis lateralibus acutis.

Lodd. rec. by Schomburgk. It has the erect raceme of *Houlletia Brocklehurstiana*, but the flowers are much smaller, form a pyramidal mass, and are yellow, streaked

with so much deep chocolate, that the former is hardly seen except on the lip. From the similarity in habit between these plants and *Maxillaria Warreana* one would have thought, they must belong to the same genus. I cannot, however, find any combining character, and their differences are very numerous.

Lindley in *London Journ.* II, p. 672: Aearay mountains: British Guiana, Schomburgk.

1426. **EUCNEMIS** Lindl. *Orch.* 161.
= *Govenia* Lindl.

Ad 1427. **LUISIA** Gaudich.

Gaudich. in *Freycinets Voyage* p. 426. (1826.) Blume *Rumphia* IV. 50. Mus. I. 63.
Walp. *Ann.* III. 548. — Lindley *Folia* I. *impressa* April 20. 1853.

Sepala herbacea, linearia, lateralibus labello suppositis, dorsali minore. Petala dissimilia, tenuiora, saepius longiora, patentissima vel fornicata. Labellum indivisum, saepius auriculatum, cum columna continuum, dependens, inappendiculatum, nunc convexum, nunc concavum et medio constrictum. Columna nana, carnosa, apoda. Stigma anticum, circulare; rostello obtuso obsoleto. Pollinia 2, cereacea, postice excavata; caudicula lata, brevi triangulari; glandula membranacea replicata. Anthera subrotunda, 2-locularis; valvulis macilentis.

Herbae epiphytae, caulescentes, erectae, junceae, Asiae et Americae tropicae. Folia teretia, rigida. Flores parvi, obscure virides vel purpurascentes.

A genus of inconspicuous, taper-leaved, rushy plants, with dingy green or purplish or yellowish flowers. The species differ greatly in the form of the lip and the proportions of the sepals and petals. They are not of the least interest to cultivators; the most remarkable is *L. volucris*, found in Khasia by Mr. T. Lobb, which does not appear to have been gathered by any other traveller.

A species occurs on rocks on Mount Victoria in Hong Kong, where it was found by Major Champion (*herb. Chamb.* 526); but it was not seen in flower and cannot be identified. It may possibly be *L. teres*.

1. **LUISIA VOLUCRIS** Lindl. l. c. sub 1

L. spicis brevissimis paucifloris, sepalo dorsali recto lineari cucullato, petalis fere triplo longioribus patentissimis linearibus subspathulatis, labello biauriculato lamina cordata oblonga convexa.

Wild in Khasia—T. Lobb. (v. s. sp. comm. am. Veitch.)

Much the most striking of the genus. The flowers look like little birds with narrow outspread wings, or petals. They are nearly two and half inches from tip to tip.

2. **LUISIA PSYCHE** Rehb. fl. in v. *Schl. B. Z.* 1863. p. 98.

3. **LUISIA ANTENNIFERA** Blume *Museum* 64. Lindl. l. c. sub 2:

L. spicis multifloris, sepalis oblongis lateralibus margine reflexis, dorsali cucullato. petalis angustissimis elongatis apice subincrassatis, labello biauriculato ovato obtuso ad callosum apicem margine revoluto.

Wild in Borneo; on trees near Martapura-Blume.

4. **LUISIA TENUIFOLIA** Blume *Museum* 64. Lindl. l. c. sub 3:

L. petalis sepalo dorsali duplo longioribus, sepalis lateralibus sub apice mucronulatis, labello oblongo biauri convexo trisulcato apice tenui bilobo.

Tsierou-mau-maravara. Rheede XII. t. 5.

Cymbidium tenuifolium. L.O., 167.

Birchea teretifolia. A. Rich. *Ann. Sc.* 1841. 1. 10.

Luisia Birchea. Blume l. c.

Wild in Ceylon—Macrae; Nilgherry mountains—Hooker; Malabar—Rheede; Khasia Lobb. (v. s. sp.)

Sepals and petals yellowish green. Lip pale green, painted with purple, and bearing some resemblance to an Ophrys.

Huc? : *Birchea* A. Rich. in Ann. sc. nat. 1841. N. S. XV. p. 66 :

Calyx subringens, sepala externa libera subaequalia, linearia, interna paulò longiora, labellum sessile, carnosum, ecalcaratum, oblongum, superne canaliculatum apice bifidum. Columna brevis aptera. Pollinia 2, integra, lamina pellucida lata, apice superne replicata et altera lamina glandulosa ovali angulatum terminata insidentia.

Herba epiphyta. Caulis teres, foliosus. Folia teretia, carnosa, basi vaginantia, decidua. Flores albi in spicam oppositifoliam, brevem, paucifloram dispositi.

Ex tab. analytica Lindl. est *Adenoncos* Blume. Sed differt ab *Adenonco* petalis majoribus, polliniis 2, appendice stigmatica caudiculam terminante, lateri affixa.

Dr. Birch med. en chef à la résidence d'Otacamund aux Nilgherries.

Birchea teretifolia AR. l. c. tab. 10. - Radix parasitica, fibris crassis, longis, teretibus, glabris, simplicibusque constans. Caules plures ex eadem radice, teretes, graciles, simplices, pedales et ultra, foliis aut vaginis foliorum elapsorum persistentibus omnino vestiti. Folia alterna approximata, basi vaginantia, teretia, carnosa, 3-5" longa, apice acuta, superne sulco longitudinali notata, diametro ne sesquilineam lata, decidua. Vaginae tubulosae, caulem amplectentes, substriatae, persistentes. Flores albi, spicam e vagina folii erumpentem, oppositifoliam 3-5 florum, brevissimam efformantes. Rhachis crassa, brevis, vix semiunciam longa. Bractee ad basin singulorum florum subsessilem parvulae, squamaeformes, subconcaevae, crassae, subovales, acutiusculae, persistentes. Calycis sepala externa erecta, aequalia, lanceolato-sublinearia, obtusa; duo interiora lateralia paulisper longiora, lineari obtusa, subtrinervia, omnia libera. Labellum sepalorum interiorum longitudine, oblongum subangustum, plano-subcanaliculatum, basi vix biauriculatum, sessile, apice bifidum, lobis obtusis margine subsinuosis. Columna brevis, aptera, apice antice subbitoba, stigma crassum faciem anticam subconcaevam columnae occupans. Anthera terminalis operculiformis, postice obtuse et appendice suberistaeformi obtusa notata, antice plana, subtransversalis, et appendici stigmatico-glandulosae (stigma superanti) applicata. Pollinia 2 subovoideo-globosa integra, insidentia in lamina (caudicula) membranacea, tenera, translucida, e duabus partibus constanti, una plana, ovali, horizontali, basi superne replicata et alteram paulo minorem, superne glandulosam et appendicem stigmaticam efformantem gerenti. — In vallibus calidis sylvaticis circa Avalanchy. Nilgh. Perottet.

Obs. Haec addidi praecipue cum plantam et flore albo, et labello angustissimo forsitan specie a *Lousia tenuifolia* recedere putem. Rchb. fl.

Wight Ic. pl. Ind. Or. III. n. 911. (1814): *Cymbidium triste* W. difficult to dry. Hence Dr. Lindley seems imperfectly acquainted with it having only had a bad worm — eaten specimen to examine. I cannot however understand on what principle the racemes of this and one or two allied species are called umbels. They are short, but distinctly racemose. Another peculiarity of some species of the section of this genus to which this belongs is the form of the lip, a hollow inflated sack. — Serius a cl. Wight pro *Cymbidium tenuifolio* declaratur. Ic. V. (1851). 911. *Cymbidium tenuifolio* W. *Cymbidium triste* R. W. Ic.: leaves subcylindrical (terete), umbels subsessile, sepals linear-obtuse, spreading, mucronate below the point; shorter than the oblong, linear, obtuse, subfalcate petals and lip; lip oblong, concave, with three callosities on the disk, auricles at the base, membranaceous, twolobed at the base, sepals yellowish green, lip purple, streaked with paler lines. Branches of trees. Eastern slopes of Nilgherries and Iyamally Hills. July — October.

5. LUSIA TRICHORRHIZA Blume Mus. 63. Lindl. l. c. sub 4:

L. racemo paucifloro, petalis sepalo dorsali parum longioribus, sepalis lateralibus alte carinatis, labello convexo oblongo rotundato basi biauri supra basin interrupto, radicibus junioribus pubescentibus.

Vanda? trichorrhiza. Hook. Exot. Bot. t. 72.

Cymbidium triste. Hooker, in Bot. Mag. t. 3648.

Wild in Khasia, at the base—J. D. Hooker and T. Thomson; hot valleys of Sikkim J. D. Hooker; Nilgherry mountains Hooker (v. s. sp.)

This is the stoutest and stiffest of the genus, sometimes with an enormous development of downy roots. Flowers dull dirty purple, or (as in B. M. 3648) with white sepals and petals.

Obs. Moneo, hanc apud ill. Lindley horribilem esse farraginem. Nam tres combinat species. *Cymbidium triste* Hook. B. M. 3648. est *Luisia platyglossa* Rehb. fil. Planta ex Nilgherry mountains Hooker (ipsissimam habeo a cl. Lindleyo trichorrhizam signatam) est eadem, quae Wight Ic. 1689, quam Lindley sub *L. brachystachyde* citat inter icones, dum locum inter loca non receperit. Eandem habeo ab amic. Wight. Rehb. fil.

6. LUISIA TERETIFOLIA Gaudich. Freyc. Voy. 426. t. 37. Blume Rumphia IV. 50. t. 194. f. 3. t. 197. D. Museum 63. Lindl. l. c. sub 5:

L. spicis multifloris, sepalis oblongo-ovatis acutis, petalis paulo longioribus linearibus obtusis, labello auriculato constricto lamina oblonga concava 3-callosa.

Epidendrum triste Forster prodr. n. 314.

Wild in the Malay Archipelago—Blume; New-Caledonia—Forster.

I have not seen this plant. According to Blume the flowers are greenish yellow, with a dark purple lip bordered with yellow.

Obs. Moneo, hic iterum ill. Lindley in errorem incidisse licet ab ill. Blume deceptum. Labellum enim iconis Gaudichaudianae exacte omnino recedit ab illo Blumeanae. Gaudichaudiana habet abbreviata, Blumeana elongata labello.

7. LUISIA CONFUSA Rehb. fil. = *Luisia teretifolia* Blume Rumphia cf. supra:

Tepalis sepala excedentibus apice dilatatis lobulatis, labello pandurato acuto, laciniis posticis triangulis, antica oblongo triangula.

Amboyna Zippel.

8. LUISIA TERES Blume Museum 64. Lindl. l. c. sub 6:

L. spicis paucifloris, sepalis lateralibus angustioribus carinatis, dorsali et petalis subaequalibus, labello biauriculato oblongo sulcato apice bifido c. mucrone intermedio.

Epidendrum teres Thunb. Fl. Jap. p. 30; Ic. Pl. Jap. decas 1.

Wild in Japan—Thunberg.

9. LUISIA ZEYLANICA Lindl. l. c. 7:

L. spicis sessilibus nanis, sepalo dorsali petalis acuminatis obtusis multo brevioribus, labello concavo oblongo laevi medio constricto.

Cymbidium triste Hort. Angl.

Wild in Ceylon—Macrae (v. s. sp. et v. c.)

Flowers dull green with a dull violet lip.

10. LUISIA VALIDA Rehb. fil. in Bonpl. X. 1862. 335.

11. LUISIA BURMANICA Lindl. l. c. sub 8:

L. spicis brevissimis, sepalis petalisque inflexis acuminatis, labelli inauriculati ungue lato sulcato lamina ovata cordata acuta papillosa.

Cymbidium triste Griffith Notul 340 in part.

Wild in Burma; near Mergui—Griffith (v. ic. pict. beat. inventoris.)

I only know this from a sketch by Griffith. It has the habit of *L. tenuifolia*, but the flowers are totally different. They are greenish daggled with red, and the lip is black purple with green stains inside the edge.

12. LUISIA UNIFLORA Blume Museum 64. Lindl. l. c. sub 9:

L. floribus solitariis longe pedunculatis, petalis sepalis aequalibus, sed triplo angustioribus, labello concavo medio constricto dimidia inferioris venis rectis elevatis superioris ovatae medio calloso.

Mesoclastes uniflora LO., 45.

Wild in Nepal; Gossain Than—Wallich (v. s. sp.)

Entirely different from *L. tenuifolia*, to which Blume suggests, that it may be referred.

Obs. Ill. Lindley falsissime citat „Blume Rumphia 64.“

13. LUISIA BRACHYSTACHYS Blume Rumphia 64. Lindl. l. c. (sub 10):

L. racemis sessilibus, sepalis petalisque subaequalibus, labello concavo medio constricto apice ovato sulcato.

Mesoclastes brachystachys LO. 45.

Cymbidium triste Roxb. Fl. Ind. III. 461. Wight Ic. t. 1689.

Wild in Continental-India; Delta of the Ganges, common—Roxburgh; Silhet—Wallich; Khasia—Lobb; Java and Borneo—Blume (v. s. sp.)

Flowers pale pink—Wight; yellowish—Blume; greenish yellow, lip dark purple with a few yellowish spots—Roxburgh.)

Obs. Haec est sincera farrago ex duabus sequentibus. Rchb. fil.

13. LUISIA ZOLLINGERI Rchb. fil. Mss.: *Luisia brachystachys* Bl. quoad loca moluccana, Lindl. idem. Rchb. fil. Xenia I. 78. l. 1—3.14. LUISIA BRACHYSTACHYS Rchb. fil. Mss. *Mesoclastes brachystachys* LO. 45. Huc: *Cymbidium triste* Wild (not R. W. Ic. 911). Wight Ic. 1689:

Leaves (subcylindrical), umbels subsessile; sepals and petals connivent, fleshy oblong, boat shaped, lip oblong, twice the breadth of the sepals. — Flowers pale pink, lip at first conformable, afterwards lila. Jyamally Hills. Sept. Oct. Wight.

15. LUISIA PLATYGLOSSA Rchb. fil. Mss. *Cymbidium triste* Hook. B. M. 3648. *Luisia trichorrhiza* Bl. Rchb. fil. Xenia I, 77. 8—18. *Luisia zeylanica* Lindl. l. c. p. 204.

Obs. Mihi Luisias iterum comparanti omnino patet, hanc cum *L. zeylanica* haud bene compositam, quae sepalo summo brevissimo, sepalis acuminatis, labello ligulato, columna brevissima longe abhorret. Nostra quidem peraffinis iconi Gaudichaudianae

16. LUISIA OCCIDENTALIS Lindl. l. c. sub 11:

L. spicis nanis sessilibus, sepalis petalisque incurvis aequilongis, labello cordato ovato oblongo convexo emarginato.

Wild in Neu-Granada. St. Martha—Purdie, (v. s. sp. comm. cel. Hooker.)

Flowers very small. Habit quite that of *Luisia brachystachys*. Pollen apparatus unknown to me.

1427. **CYMBIDIUM** Sw.

Nov. Act. Ups. VI. 70.

1. CYMBIDIUM ENSIFOLIUM Sw. l. c. 77. Huc Lindl. B. Reg. XXIII. (1837). 1976:

Foliis lineari-ensiformibus striatis acutis, scapis erectis multifloris, bracteis ovario multo brevioribus, sepalis petalisque lineari-oblongis acutis, labello indiviso, planiusculo oblongo undulato obtuso medio sulcato, sulco pone apicem bidentato.

Epidendrum ensifolium L. sp. pl. 1352. etc.

α. *striatum*. Bot. Nag. 1751.

β. *estriatum* / sepalis virescentibus petalisque albidis obsolete striatim sanguineo punctulatis, lineis nullis.

The variety of this plant originally introduced from China, we have not seen for some years; it had flowers distinctly lined with purple as in the fig. of Bot. Mag. That which is now more generally cultivated is what is here represented with greener sepals and pale whitish petals, both without lines, and seems intermediate between the first and the spotted *Cymbidium xiphiifolium*.

Rehb. fil. Bonpl. III. 250: Hongkong Hance! — Huc: *Cymbidium micans* Schauer in Act. Leop. XIX. Suppl. ip. 433. 1843:

Foliis elongato linearibus acutis tricostatis striatis complicatis acute carinatis recurvatisque, scapis erectis subsexfloris, bracteis scariosis acuminatis ovario ter brevioribus, sepalis petalisque lineari-lanceolatis striatis acuminatis, labelli lobis lateralibus obsolete rotundatis, intermedio suborbiculari undulato revoluto; lamellis arcuatis apice incrassatis convergentibus.

China. Macao. August.

Perigonium ovario subaequale, 10". Labellum concavum sepalis conspicue brevius, disco subtilissime velutinum, lobis lateralibus auriculas rotundatas in laminam (sc. hypochilium) obcordatam confluentes exhibentibus, terminali producto obtuse revoluto. Scapus subsexflorus, dodrantalis, inferne vaginis intus scariosis approximatis, superius in bracteis decrescentibus. Flores purpurei (?). Pollinia dorso bisectilia, sibi accumbentia. — Lindl. in Benth. Fl. Hongk. in Hook. Journ. Bot. VII. 35: On rocks near Cyrtipedium purpuratum in Oct. The flowers are of a dirty white, with violet spots.

2. CYMBIDIUM XIPHIIFOLIUM Lindl. Bot. Reg. 529. Rehb. fil. Bonpl. III. 250: Hongkong Hance!

3? CYMBIDIUM GIBSONI Paxton in Paxton Fl. G. III. 618. Xyl. 301:

Caule fusiformi articulato nudo, foliis lanceolatis acutis, spicis lateralibus striatis paucifloris, scapo squamis vaginantibus parum longiore, sepalis linearibus obtusis apice latioribus, petalis erectis obtusis, sepalo dorsali paulo brevioribus, labello ovato medio contracto apice recurvo obtuso, lamellis 2 arcuatis elevatis continuis.

Naturally allied to *C. ensifolium* and *lanceifolium*, and is readily recognized by its fusiform, jointed naked stem, lateral inflorescence, unusual circumstances among *Cymbidia*. — Khasiya. Flowers sweet, greenish, with brown spots.

Obs. In Lindl. „Contributions to the orchidology of India“ haec species in linea prima sub „188. *C. lanceifolium* Hook.“ cum signo? affertur. In linea ultima contra declaratur: „*C. Gibsoni* is only a half monstrous state of this“. In lineis ultimis in Paxton l. c. planta est „readily recognized by“ etc. Jam, benevole lector, credas, quae placebunt. Equidem scire vellem, quid intercedat inter plantam, quae sit „half monstrous“ atque, quae sit: „wholly monstrous.“ Rehb. fil.

4. CYMBIDIUM ERECTUM Wight Ic. V. I. (1851) 1753.

Leaves ligulate, succulent, rigid, deeply and obliquely emarginate, raceme erect, manyflowered; bracts small, fleshy sepals linear somewhat obtuse; narrower than the lanceolate acute petals: lip 3lobed, middle one pubescent and revolute at the apex, lateral ones acute, lamellae linear, straight.

Iyamally Hills, near Coimbatore. Aug. Sept.

Approaches *C. aloifolium*; its erect rigid habit, thick fleshy ligulate leaves, broad short scales at the foot of the scape at once proclaim it distinct. Colour of flowers is nearly the same in both, a blending of reddish and yellow deepening nearly to purple along the middle line; limb of lip purplish red, yellow near the base.

5. CYMBIDIUM CHLORANTHUM Lindl. B. R. XXIX. 1843. Misc. 102:

Foliis ensiformibus supra pseudobulbum breve oblongum equitantibus obtusis supra medium planis recurvis, racemo stricto foliis bre-

viore, bracteis minutissimis, sepalis petalisque obtusis, labello basi pubescente apice retuso emarginato, laciniis lateralibus nanis triangularibus, lamellis distantibus arcuatis verrucosis.

Nepalese species. Loddiges. Strictly erect racemes as of *C. ensifolium* separate it widely from the majority of Indian species. Sepals and petals are green, the lip yellowish spotted with crimson at the base. After flowering the blossoms soon become of a dirty wine colour.

Huc: *Cymbidium variciferum* Rehb. fil. in Bonpl. II. 91:

Aff. *C. ensifolium*: labello ligulato, medio trilobo, lobis lateralibus apice acutis lobo medio paulo latiori superpositis, illo ovali acutiusculo minute lobulato, lobulis microscopice denticulatis, carinis carinulato varicosis 2 a basi in medium convergentibus, ibi parallelis, regione anteposita — disco basilari lobi medii — velutina.

Blatt länglich zungenförmig, pergamentartig. Blüten gelbgrün, mit Purpur. Cultur der Herren Booth und Söhne.

6. CYMBIDIUM MADIDUM Lindl. Bot. Reg. XXVI. (1840) Misc. 6:

Foliis ensiformibus basi canaliculatis, racemis pendulis, sepalis ovalibus obtusis apiculatis patulis, petalis conformibus erectis, labello nudo per medium madescente oblongo, lobis lateralibus minimis intermedio oblongo obtuso basi paululum angustato.

East India imp. Rollisson. Leaves of *C. chinense*. Flowers dull yellowish green, with sepals about half an inch long. Labellum is yellower, with a deep purple stain inside and is together destitute of the lamellae so usual in this genus; in room of which there is a shining exsudation all along the axis. No smell.

7. CYMBIDIUM PENDULUM Sw. Nov. Act. Ups. 673. Lindl. Bot. Reg. XXVI. (1840.) 25:

Foliis ensiformibus distichis coriaceis oblique obtusis, racemis pendulis multifloris, bracteis minutis, petalis sepalisque lineari-oblongis obtusis, labelli trilobi lobis lateralibus acutis intermedio oblongo apiculato, lamellis continuis approximatis apice confluentibus.

Sylhet on trees. Roxburgh: also in the forests, which cover the Circar mountains as well as those of Bengal Noakote in Nepal; Wallich. The latter Botanist considered this plant different from that of Roxburgh, and it has smaller flowers; but I do not perceive in what the distinction otherwise consists. The species now figured was sent by Dr. Wallich to the Hon. and Rev. W. Herbert.

Perigonium flavum, labellum medio flaveolum, crista apice lobi medii et lobis lateralibus purpureis, labellum extus totum purpureum.

Lindl. Bot. Reg. XXVIII. (1842). Misc. 67:

Cymbidium pendulum var. *brevilabre*: differs materially in having a much widened shorter lip, the middle lobe of which is almost round; otherwise it appears to be the same. — Lindl. l. c. XXX. (1844). 24: eadem. Sepala et tepala olivacea. Labelli lobi laterales et basis lobii medii purpurei; anterior pars lobi antici alba medio flava; antice purpureo maculata. — Gardn. Chronicle 1854. 287: *Cymbidium pendulum* var. *atropurpureum*. A Borneo plant in the possession of John Knowles; proves to be a narrow leaved variety of this species, with deep purple sepals and petals, and yellow ribs to the lip. It is far handsomer, than the older variety. The same form is before us collected by Cuming in the Philippines.

8. CYMBIDIUM ALOFOLIUM Sw. Nov. Act. Ups. VI. 73: Wight Ic. 1687. 1688:

Leaves ensiform, coriaceous, oblique, obtuse; racemes pendulous, many flowered; bracts minute, petals and sepals lanceolate somewhat obtuse, lip revolute, lateral lobes acute, middle one oblong, obtuse, plates interrupted, clavate, arcuate towards the base. Petals and sepals yellowish red, lip dark lilac, tending to purple. Neigherries.

Raceme represented. erect for want of room.

9. *CYMBIDIUM DEVONIANUM* Paxt. Mag. X. 98. (Khasiya Hills, Gibson.)
10. *CYMBIDIUM BICOLOR* Lindl. Orch. 164. Lindl. Bot. Reg. XXV. (1839). Misc. 69:
Ceylon: imported by Loddiges. Flowers like *C. aloifolium*, only streaked and stained with very deep crimson. Readily distinguished by having a sac at the base of the lip.
Huc: *Cymbidium pubescens* Lindl. Bot. Reg. XXVI. (1840). Misc. 177:
Foliis ensiformibus striatis apice oblique bidentatis, racemo brevi pendulo, bracteis minimis squamaeformibus, sepalis petalisque linearibus acutiusculis, labelli trilobi basi saccati intus pubescentis laciniis lateralibus acutis intermedia oblonga subundulata obtusa, lamellis rectiusculus medio interruptis.
Singapore. Cuming. Loddiges. Short raceme of rich purple flowers bordered and spotted with brilliant yellow. Nearly allied to *C. Finlaysonianum* and *C. bicolor*, but its flowers are smaller; its raceme shorter, and its downy lip is quite different.
Lindl. B. Reg. XXVII. (1841). 38: Differs from *C. Finlaysonianum* in having short racemes, smaller flowers and a hairy lip with the lamella nearest the end destitute of any appendages; from *C. bicolor* also the short racemes and hairy lip divides it, but it corresponds with that species in the remarkable character of a shallow bag being present at the base of the lip.
-
- 11?? *CYMBIDIUM IRIDIFOLIUM* All. Cunn. Bot. Reg. XXV. (1839). Misc. 37:
Foliis elongato-linearibus, racemis multifloris bracteatis, perianthii foliolis patentibus, exterioribus tribus ellipticis obtusis, labello trilobato lobo intermedio linguiformi disco ecarinato glanduloso punctato nitido.
On decayed trunks of trees in large masses. Damp shaded woods on the Brisbane river. July 1828. This plant was alive at Kew. New-South-Wales.
-
12. *CYMBIDIUM Plicatum* Harv. Comp. to Bot. Mag. II. 203:
Scapo erecto vaginato multifloro, spica ovata, bracteis ovario longioribus lineari-lanceolatis, sepalis erectis obtusis, labello trilobo, lobis lateralibus obtusis incurvis, medio truncato involuto ciliato, foliis radicalibus ensiformibus plicatis, scapo longioribus. — Hook. Ic. (1837). II. Tab. CIV.

14. *CYMBIDIUM EBURNEUM* Lindl. Bot. Reg. 1847. t. 67. Cf. Walp. Ann. I. 784. Sed habitat in India orientali.
-
15. *CYMBIDIUM MASTERSII* Griff. Lindl. Bot. Reg. XXXI. (1845). 50:
Foliis distichis anguste ensiformibus obtusis, pedunculo erecto squamis herbaceis equitantibus acutissimis imbricato, spica brevi pauciflora squamis immersa, sepalis petalisque lineari oblongis acutis, labello obovato trilobo intus pubescente, lamellis continuis, apice confluentibus in tuberculum subtridentatum expansis, lacinia intermedia oblonga lobata undulata, lateralibus rotundatis planis.
C. Mastersii Griffith in ht. Bot. — Calc. Lodd Cat. n. 1233.
East Indies, received by Mrs. Loddiges. Snow white flowers, sweetscented, with the fragrance of almonds. Its erect flower stalk closely covered with long green sharp-pointed equitant imbricated sheaths is quite unlike of that of any other species. — Paxt. Fl. G. III. p. 21. Pl. 78. — Lemaire l. c. 289.

16. CYMBIDIUM ELEGANS Lindl. Orch. 163. — Sert. Tab. 14 :

Nepal Wall. 1821. Drawing in posses. of the Hon. Court. of Dir. of East Ind. Comp. Leaves $1\frac{1}{2}$ " long, $\frac{3}{8}$ — $\frac{1}{2}$ " wide, acuminate, obliquely emarginate at the point; as stout as a European Typha, at the base they combine into a broad, fleshy sort of bulb. Scape arises from near the base of the leaves, 18" long and so loaded with flowers for half its length, that it hangs down in a pendulous manner, below the flowers it is loosely covered with long, inflated, acuminate, imbricated scales, which abruptly change into small, narrow, scale-like bracts. The raceme is from 6—10—11 inches long, nodding, cylindrical, very compactly covered with pale salmon-coloured flowers, each rather more than one inch and a half long, and greenish before they expand. Sepals form a kind of inverted cone, so little do they open; they are linear oblong, acute, of the same figure, but the petals are the shorter and narrower. Lip is parallel with the column, obovate, straight, wedge shaped ad the base, divided at the point into 3 acute lobes, of which the middle one is the broadest and longest, it is of the same colour as the sepals, but is a little spotted with red. Along its centre there runs a double elevated line, which is separated near the base into two spreading lamellae. Column very long, clavate, half terete, with a convex plain anther, a little prolonged in front. Pollen masses are two, pearshaped, furrowed out at the back, and planted separately upon a transversely oval gland. In this respect the present differs somewhat from other true Cymbidia, but not sufficiently to deserve being made into a distinct genus. — Cf. Walp. Ann. III. 548. *Cyperorchis* Bl.

17. CYMBIDIUM VIRENS Lindl. B. Reg. XXIV. (1838) Misc. 59:

Foliis gramineis recurvis serrulatis subtrinerviis, scapo laxe vaginato unifloro, pedunculo tereti bractea duplo longiore, sepalis linearibus obtusis concavis patentibus, petalis brevioribus conformibus supra columnam conniventibus, labello oblongo indiviso apice revoluta imberbiplicis duabus carnosiss lamellatis apice liberis fovea truncata irregulari utrinque infra apicem plicarum.

A native of Japan, whence it was brought to Europe by Dr. Siebold. Flowered in April in the nursery of Messrs Rollissons of Tooting. It has greenish sepals and petals, about $1\frac{1}{2}$ " long, and a pale dull yellow lip, slightly blotched with dull red. I did not remark any smell. No doubt this will prove a greenhouse species.

18. CYMBIDIUM GOERINGII Rehb. fl. Walp. Ann. III. 547.

19. CYMBIDIUM GIGANTEUM Wall. Lindl. Orch. 163. Lindl. Sert. tab. 4:

Leaves two feet long, 7 nervous, narrow, thick and tough, dilated at the base. Scape erect, closely covered at the base with loose imbricated striate scales, bracts short, ovate scales, ovary $\frac{1}{2}$ ". Flowers rather closed, dull purple tessellated, very large for the genus. Sepals oblong, acute, erect, $1\frac{1}{2}$ ", nearly equal, 2 lateral uppermost. Petals linear lanceolate, acute, spreading, rather shorter than the sepals. Lip oblong, tapering at the base, where it adheres to the column, complicated, 3-lobed; the lateral lobes entire, flat narrow, the intermediate crisp, ciliated, the disk with 2 converging ciliated lamellae, ending in a line of hairs, that reach to the point of the lip, and bordered by 2 distant hairy lines on each side. Column clavated, edged, smooth, with a terminal anther, which adheres firmly to the back and hardly opens in front. — Kamaon Wallich 1821. — Lindl. Paxt. Fl. G. II. p. 14 279. Xyl. 143; „anther really articulated with column". — B. Mag. 4884.

Quid? Certe non Cymbidium:

CYMBIDIUM — All. Cunn. B. Reg. XXIV (1839.) Misc. 38.

Caule radicante, scandente, foliis alternis lanceolatis acutis, subcarnosis, racemis axillaribus laxis, foliis perianthii conniventibus, labello carnoso trilobato, basi cavo.

A Vanda looking plant, in habit very much like *V. tereifolia* Lindl. Coll. bot. t. 6: Can it be *Ep. triste* Forst., which that Botanist discovered in New-Caledonia? My

plant, of which I only detected a single specimen, was hanging to the trunks of *Calistemon rigidum* in small open savannahs subject to inundation; near the banks of the Brisbane River. Sept. 1839.“

1427/2. **ANSELLIA** Lindl.

Bot. Reg. XXX. 1842, sub 12. — Walp. Ann. I. 784.

Sepala oblonga, carnosa, aequipatentia, libera. Petala conformia, recta, patula, duplo latiora. Labellum sessile patulum, trilobum, bilamellatum, lobo medio minore verrucoso. Columna elongata, marginata, basi utrinque auriculata. Anthera bilocularis. Pollinia 4, sessilia, basi contigua, duobus dorsalibus multo minoribus; glandula angusta utrinque acuminata. Caulis elongatus, teres, apice tantum foliosus. Folia plicata, coriacea. Panicula terminalis.

It appears, that this genus must be referred to that set of Vandeeae of which *Cymbidium* must be taken as the type. In fact it is very near that genus in technical characters, though extremely different in its manner of growth. The auricles at the base of the column, the 4 pollenmasses and the very narrow gland fining away to each side will serve to distinguish it.

1. **ANSELLIA AFRICANA** Lindl. Bot. Reg. (1842.) XXX. sub 12:

When Mr. Ansell was ill from the effects of the Niger expedition, at Fernando Po, he found in Clarence Cove, growing on the stems of the Oil Palm (*Elaeis guineensis*) an epiphyte with a slender jointed stem about 2 feet long, having at the upper end many stiff, plaited, lanceolated, 5 ribbed leaves, and a terminal panicle of flowers as large as those of *Vanda Roxburghii*, with dark purple spots on a pale ground. Of that plant we possess a dried specimen, with one of the lower branches of the panicle in good preservation, and as it proves to be a new genus we take the opportunity of naming it after its discoverer. — Bot. Reg. 1846. tab. 30. — Regel Gartenflora III. t. 95.

2. **ANSELLIA GIGANTEA** Rehb. fil. Cf. Walp. Ann. I. supra c. — Rehb. fil. in v. Schl. Bot. Ztg. 1852. 688. *Ansellia africana* Lindl. und *gigantea* Rehb. fil. Linnaea XX. 6. p. 673. Frische Blüten erster Art setzten mich im letzten Winter in den Stand, beide Arten weiter zu vergleichen, wie ich es in der Linnaea versprochen. Erstere ist zwar ganz vortrefflich im Bot. Reg. (1846. t. 30.) abgebildet, allein die Pflanze muss schwächlich gewesen sein, ich kenne die Blüten grösser und schöner. Meine *A. gigantea* erreicht nur die halbe Blüthengrösse jener. Sie unterscheidet sich vor Allem durch die Lippe, deren Mittelleisten gekerbt und gekräuselt sind; die Warzen fehlen, doch fand ich sie auch bei *Ans. africana* viel geringer, als sie abgebildet wurden. Die seitlichen Hüllblätter sind kürzer, als die äusseren; der Kegelaufsatz der Anthere ist kurz. Das Blüthengewebe ist zarter und gleicht dem des *Grammatophyllum multiflorum* (nicht *speciosum*!). Jedenfalls eine wichtige Bestätigung der Lindley'schen Gattung. Beide theilen Tracht, die Oehrechen am Fuss der Säule, die gespitzte Anthere, was Alles zur Trennung von *Cymbidium* genügt. Eine Farbenskizze zweier Blüten, die ich erhielt, zeigt folgendes. Die Hüllblätter sind blass gelbgrün; mit braunen Flecken, welche fast zweireihig auf der unteren Hälfte der Innenseite stehen. Seitenlappen der Lippe und Säule ähnlich gefärbt, erstere innen braun gestreift, Mittellappen der ersteren schön citronengelb.

1328. **GROBYA** Lindl.

Bot. Reg. XX. (1835.) 1740.

Perianthium explanatum, bilabiatum. Sepala lateralia basi connata, sigmoidea, labello supposita, supremo erecto breviora. Petala dilatata,

sepalo multo majora, erecta, conniventia; labellum liberum, lobatum, nudum, cum basi columnae articulatum, ascendens, sepalis minus, (nanum): Columna erecta semiteres, arcuata, basi incrassata; anthera proclivi, stigmatē fornicato.

Pollinia 2, postice lobata, caudiculis duabus brevioribus glandulae ovali adnatis. Herba Brasiliensis, pseudobulbosa, foliis gramineis, racemo pendulo radicali. — Near *Cymbidium*.

1. GROBYA AMHERSTIAE Lindl. l. c.:

Pseudobulbi ovati, virides teretes, cicatricibus 1—2 foliorum annulati. Folia 3—4 e vagina squamata, linearia, striata, acuta, debilia. Racemus pendulus, densus, 3 pollices longus, pseudobulbis duplo longior. Sepala pallide ochracea, unicolora. Petala maculis fusco-purpureis seriatis notata. Labellum cuneatum, apice 5 lobum lobo quinto caeteris exteriori, disco nudum, atropurpureum. Columna pallida, facie purpureo fasciata.

Brazil, sent by Heyne.

2. GROBYA GALEATA Lindl. Bot. Reg. XXVI. (1840.) Misc. 197:

Petalis oblongis oblique rhombeis apice rotundatis cum sepalo dorsali breviorē in galeam dispositis; sepalis lateralibus deflexis, basi connatis, labelli tripartiti laciniis lateralibus linearibus, intermedia cuneata truncata, disco basi quadridentato tuberculis nilentibus verrucoso.

Brazilia. I received specimens from Mrs. Lucombe, Pince, and C. of Exeter, and Mr. Barker. Its habit is of *Grobya Amherstiae*, but flowers different. They are dull green, stained with purple, and the lip is indistinctly banded with the same colour. Petals are much larger, than the dorsal sepal, beneath which they are so placed as to resemble a helmet overshadowing the lip. This species indicates the affinity of *Malachadenia*, which is apparently allied to *Grobya*.

1430. **CREMASTRA** Lindl.

Orch. 172.

Huc: *Hyalanthorchis* Blume. Cf. Walp. Ann. III. 547.

1431. **GRAMMATOPHYLLUM** Blume.

Bijdr. 379. Tabelle 20. — Diagn. Gen. Cf. Walp. Ann. III. 550.

1. GRAMMATOPHYLLUM SPECIOSUM Bl. Bijdr. 377. etc. Lindl. Paxt. Fl. G. II. Tab. 69:

Caulescens foliis distichis ensiformibus, enerviis, scapo erecto racemoso, floribus coriaceis pedicellis aequalibus, sepalis petalisque obovato-oblongis undulatis obtusis, labelli lobo medio velutino ultra medium glabro abrupte tricostato circa costam in fundo piloso.

We have it from the streat of Malacca, where the late Mr. Griffith found it, with „a scape, six feet high, and an inch in diameter at the base.“ — Walp. l. c.

2. GRAMMATOPHYLLUM MACRANTHUM Rehb. fl. Xenia II. p. 16. Huc *Pattonia macrantha* Wight. Ic. VI. t. 1780. (1851). — Huc: *Grammatophyllum fastuosum* Lindl. Paxt. Fl. G. II. 159. sub 69:

Foliis . . . , scapo erecto subcorymboso, floribus coriaceis pedicellis duplo brevioribus, sepalis petalisque obovatis undulatis obtusis anticis incurvis, labelli lobo velutino infra basin glabro tricostato, circa costam in fundo scabropiloso.

A single specimen of this majestic plant was sent us from Malacca by Griffith who found it on trees, and saw no leaves. It is upon the whole a finer species, than *Gr. speciosum* itself. The flowers are not quite so large, but in consequence of the greater length of their stalks (as much as 5 inches), they form a kind of corymb. Their colour is unknown to us. Both sepals and petals are more spatulate, the two anterior of the former far more incurved and the naked ribs of the lip, instead of reaching almost as far as the point of its middle lobe, and then terminating abruptly, gradually lose themselves in the pile of velvet at the very base of the lobe. The lip appears moreover to be much more coriaceous.

3. *GRAMMATOPHYLLUM MULTIFLORUM* Lindl. B. Reg. 1838. Misc. 80. 1839. t. 65. (*perigonii phyllis prope omnino fuscis*); var. *tigrinum* *ibid.* 1842. t. 69. (*perigonii phyllis flavidis maculatis*) Lindl. Paxt. Fl. G. I. c.:

Foliis lanceolatis coriaceis subundulatis striatis in apicem pseudobulbi ovato insidentibus, scapo incurvo, racemo erecto longissimo cernuo multifloro, floribus membranaceis, sepalis oblongis obtusiusculis planis, petalis acutis subconformibus angustioribus, labelli trilobi pubescentis medio hirsuti lobo intermedio plano oblongo rotundato, lateralibus erectis subfalcatis, jugo in medio carnosio elevato ad basin lobi intermedii interrupto in costas 2 lamelliformes producto, columnae margine supra basin elevato flexuoso incurvo foveam altam obconicam circumdante.

The two varieties of this species, one with wholecoloured, the other with spotted flowers, were brought from the Philippine islands, and diff. altogether from both *G. speciosum* and *fastuosum* in having thinner membranous flowers, instead of the thick leathery texture of those two species, and drooping, not erect racemes. Dr. Blume suggests, that this may not be different from his *G. scriptum*; and it is not impossible, that it may include Rumphius second sort of *Angrecum scriptum* (the one he has figured); but it can scarcely be compared with his first sort either in leaves, or pseudobulbs or in the marking of the flowers, which have nothing grammical about them or resembling Hebrew characters. The name then, given by us in 1839, will not have to be disturbed.

4. *GRAMMATOPHYLLUM SCRIPTUM* Blume, Rumphia .IV. p. 48., Walp. l. c. Lindl. Paxt. Fl. G. I. c.

Under this name is now arranged Rumphius's *Angrecum scriptum*, and the *Cymbidium*, *Epidendrum*, or *Gabertia* founded upon it. We have never seen any specimens; the plant is not in cultivation, nor do we find, that Blume himself has any personal knowledge of it, for what he says of it, is chiefly, if not wholly, derived from Rumphius. That author describes two sorts of *Angrecum scriptum*, one of which grows upon the Mango trees, the other on the Calappa Palm tree. The first has great flattish conical pseudobulbs (*bursae*), deeply furrowed lengthwise, and each bearing 3 or 4 long narrow leaves like those of „*Helleborus albus* or *Hyris*“, thick, firm, narrow below, widening upwards, above a foot long, 3 digits wide, and having in the middle 3 ribs, which dont project much. The flower stem has no leaves, is 4 or 5 feet high, a little curved at the top, from which the flowers grow regularly one above another as in *Hyacinths*. The flowers themselves are as big as a *Narcissus*, composed of 5 outer petals, narrow at the bottom, broader at the top, some yellow, others greenish-yellow and inscribed with large spots and characters and like Hebrew letters, but not distinct; they are reddish-brown, and different in different flowers. In the middle is a rolled up petal resembling a goblet, of a paler colour, streaked with brown or purple lines. Of this he says there are certain varieties. — The second, which grows on the Calappa Palm trees, and of which has he given a figure. The *bursae* or pseudobulbs are as in the other, but smooth, not jointed and they are not so much furrowed lengthwise. The leaves are shorter, broader, and thicker, without any ribs except that in the middle, from 13 to 16 inches long, and 4 broad; they grow from the young pseudobulbs (*ex tenuis bursis*). The flowering stem is from 5

to 5½ feet long, as thick as the little finger, and covered with bloom for two thirds of its length. The flowers are not unlike those of the first sort; they have 5 green petals, one of which is always turned inwards. These petals are painted with thick brown characters, which form no particular figure, but are chiefly spots; among them however you may make out the letters A. J. R. The lip is paler, than the other petals and marked lengthwise with brown lines.

In Ternate, according to Rumphius, the matrons, and especially the wives, sisters and daughters of the kings (who are all called Putri in Malay and Boki in the Moluccas), so entirely appropriate these flowers to themselves, that a common woman and especially a slave would offer there a great affront if she were to put them on her head. The flowers are reserved exclusively for the great ladies, who cause them to be sought for in the forests, and braid them in their hair, saying the nature herself has shown, that such flowers are not fit for people of low degrees since they grow nowhere except in high places; hence they are called Bouga boki and Bouga-putri, or the Princesses flower. It would also appear, that the Malay gentlemen make from the seeds a philtre, which has a surprising effect upon the ladies, who swallow it.

It is far from improbable, that these two sorts of lettered Angrec are distinct species, judging from what is said of their leaves. The second kind may indeed be identical with the species next to be mentioned.

Bot. Repos. 626. t. (1810). — Lindl. Folia I. Nov. 1. 1851. Sequentia. (Addimus pauca addenda in observationibus.)

The species of this well-marked genus are undistinguishable in a dried state, unless attention is paid to the processes which appear upon the surface of the lip. The not knowing this and the badness of materials led to a very imperfect set of definitions in L.O., as was indeed hinted in a note to that work. Even now the species require to be studied carefully in a live state.

1. GEODORUM PURPUREUM R. Br. LO., no. 1. Lindl. Folia sub 1:

Limodorum nutans Roxb. Corom., I. t. 40; Fl. ind., III. 470. *Malaxis nutans*. Willd. sp. pl. 4. 93.

This species is distinguished by two circumstances; the scape is longer, than the leaves, and the lip is acute. I have seen no specimen. Roxburgh says, that the spike is oblong and pendulous, with distant flowers of a beautiful rose-colour.

Wild in the Indian Peninsula; moist valleys amongst the Circars — Roxburgh.

2. GEODORUM DILATATUM R. Br. Bot. Reg. t. 675. (bad). L.O., no. 3. Wight ic. 3. tab. 912. Lindl. Folia sub 2:

Limodorum recurvum. Roxb. Coromandel plants, I. t. 39. — *Malaxis cernua*. Willd. IV. 93. — *Otandra cernua*. Salisb. in Hort. Trans., I., 261. — *Geodorum pallidum*. Don. prodr. fl. Nep. 31.

A common Indian species, with whitish flowers, marked with pink streaks and yellow. It has large falcate bracts, which in a dried state are membranous. The lip is either crenulate or entire at the edge. The scape is the tallest of any except *G. purpureum*.

Wild in the East Indies; moist valleys among the Circars—Roxb.; Ceylon—Macrae, Walker; Sikkim, at 3000 feet — J. D. Hooker; Sylhet — Wallich (v. s. sp.)

Obs. Wight l. c. „I found it within a few miles of Coimbatore Kanathkoovoodoa. Aug. 1813. in clefts of rocks under the shade of bushes.“

3. GEODORUM PICTUM LO., no. 2. Lindl. Folia sub 3:

This plant has broad nearly sessile leaves, and a dense oblong refracted raceme. The bracts and vaginæ are not membranous, when dried.

Wild in tropical New Holland—R. Brown; Wide Bay — Bidwill. (hab. s. sp. comm. cel. Hooker.)

4. GEODORUM RARIFLORUM Lindl. Fol. sub 4:

G. foliis longe petiolatis, scapo brevior, vaginis bracteisque parvis herbaceis, racemo raro, labello basi scrotiformi ovato obtuso emarginato callo sublibero minime bidentato caeterum nudo.

I found some specimens of this, under the name of *Limodorum candidum*, among some miscellaneous Assam plants given me by Sir W. Hooker. It has a more distinct spur, than any other, and narrow spreading sepals. There is no callosity at the mouth of the pouch.

Wild in Assam—Jenkins (v. s. sp. comm. cel. Hooker.)

5. GEODORUM FUCATUM Lindl. in Bot. Reg. t. 1687. Folia Nr. 5.

Wild in Ceylon. — Walker. (v. sp. in herb. Hooker.)

A very pretty rose-coloured species, readily known by the pair of parallel fleshy ribs, which represent the free callus of the preceding species, and by its gibbous lip.

Obs. Lindley l. c. *Geodorum fucatum*: Scapo florifero folio duplo brevior, spica pendula congesta, labello gibboso ovato emarginato integerrimo, lineis duabus callosis elevatis. Folia e tubere subterraneo cucullatim cicatrizzato erumpentia, oblongo lanceolata, acuta, plicata, pedem longa, scapo florifero duplo longiora, frugifero subaequalia. Scapus radicalis, erectus, vaginatus, apice recurvus, et spicam ideo patulam, partibus omnibus inversis, compactam, brevem gerens. Bractea lineares, acutae, ovarii longitudine. Flores subcampanulati, magnitudine et facie *G. dilatati*. Sepala lineari-oblonga, acuta, rosea, apice paululum recurva petalis paulo latioribus omnino conformia et parallela. Labellum ob spicam inversam anticum, revere posticum, ovatum, subtus gibbosum, cum columna parallelum et continuum, nec articulatum, integerrimum, emarginatum; roseum venis lateralibus intensioribus pictum; lineis duabus latis, elevatis, parallelis, contiguis, ochraceo-sanguineis in medio.

Ceylon. Watson. — Resembles *G. dilatatum*, but has rather smaller flowers and a very different labellum.

6. GEODORUM JAVANICUM Lindl. l. c. sub 6:

G. foliis oblongis sessilibus scapo univaginato aequalibus, bracteis herbaceis angustissimis ovario aequalibus, floribus carnosis, labello retuso callo tricostato tuberculoque didymo ad ostium sacci.

Cistella cernua Blume Bijdr. 293. t. 55.

The figure in Blume is so bad, that no one could suppose it belonged to the plant now before me; and yet I presume there can be no doubt about the matter. The bracts are small, very narrow and herbaceous, and the flowers when dry have a sin-

gularly fleshy texture. It is a small species with no apparent stalks to the leaves. Colour of flowers unknown.

Wild in Java—Lobb; near Buitenzorg, very rare—Blume (v. s. sp. in hb. Hooker.)

Obs. Timeo, ne hoc sit ipsissimum *G. dilatatum* RBr. Rchb. fil.

7. **GEODORUM SEMICRISTATUM** Lindl. l. c. sub 7:

G. foliis oblongo-lanceolatis petiolatis, vaginis 3 maximis membranaceis, bracteis setaceis, labello ovato emarginato callo retuso tricostato adnato tuberculoque didymo ad ostium sacci (floribus carnosis).

Very much like *G. dilatatum* in habit. Colour of flowers unknown.

Wild in the Philippines—Cuming, (v. s. sp.)

Obs. Forsan huc pertinet *Dendrobium nutans* Presl. Symb. Bot. 1832. XXIII. R. fil.

8. **GEODORUM CANDIDUM** Wall. Cat. no. 7374. Lindl. l. c.:

Limodorum candidum Roxb. fl. Ind. III. 470.

(A) Lip contracted at the point and nearly even. Leaves sessile.

(B) Lip wider at the point and rugose. Leaves with long stalks; flowers smaller.

This species, although one of the smallest in stature, has larger flowers than any. The leaves in A are sessile, the raceme very dense and somewhat globular, and the sepals and petals very acute; the lip is ovate with a slightly dilated emarginate point, within which it is nearly smooth; the sac of the lip is a mere dimple and hardly visible externally, although its origin its overlooked by a pair of large callosities. Flowers white; in A they are very like the figure of *G. citrinum* in Andrews' Repository. Probably the two supposed varieties will be hereafter distinguished. They are very different in habit.

Wild in Sylhet — Roxburgh; Moulmein — Griffith, Wallich; B. Khasia — Lobb, (v. s. sp.)

9. **GEODORUM CITRINUM** Jackson in B. Rep. t. 626. LO., no. 5, Lindl. l. c. sub 9:

This, the original species of the genus, is known by its pale-yellow flowers, and lip without a trace of appendage or callosity upon its surface. The flowers are no doubt exaggerated as to size in the figure in Andrews' Repository; according to Dr. Wallich's Chittagong specimen, they are about as large as in *G. dilatatum*.

1437. **ACANTHOGLOSSUM** Bl.

= *Coelogyne* Lindl.

1438 **SUNIPIA** Lindl.

Duchanan Hamilt. in Rees Cycl. sub Steli. Lindl. Orch. Scel. LO. p. 179. Lindl. Fol. I. impressa Jan. 10. 1853.

Sepala cartilaginea, aequalia, ringentia; lateralibus labello suppositis a dorsali basi sejunctis. Petala nana. Labellum posticum, integrum, sessile, sepalis minus, carnosum, concavum, inappendiculatum. Columna nana, libera, mutica, basi vix producta. Pollinia 4, per paria caudiculis 2 distinctis apice contiguus adnata; glandula nulla. Anthera dorso affixa, verticaliter 4-valvis. Herba epiphyta, Himalensis, pseu-

dobulbosa. Folia solitaria, coriacea. Scapus radicalis, apice spicatus. Bracteae membranaceae, spathaceae, floribus longiores.

The very peculiar anther opening vertically, with two pairs of equal pollen-masses adhering to as many tough terete elastic legs or caudicles meeting at the rostellum, which however furnishes no gland, distinguishes this very clearly from all other genera having the habit of a *Bolbophyll*, except *Acrochaene*. It differs in its having a pair of well-defined glands. The name *Sunipia*, (from *Sunipiang*, an Indian word), was applied by Buchanan Hamilton to various *Bolbophylls*, among which this would have been included at the time when he flourished.

1. *SUNIPIA SCARIOSA* Lindl. in Wall. Cat., n. 7373. LO. n. 1. Sert. Orch., frontisp., fig. 8; with a good description.

Ornithidium bracteatum Wallich MSS.

Pseudobulbs small, ovate, slightly elongated. Leaves from two to four inches long, by three to seven lines broad. Flowers white, stained with pink, shorter than the carinate glutaceous bracts, which, when closed, seem as if their outline was triangular. Lip perfectly destitute of fringes. My specimens vary from five inches to a foot in height.

Wild in the Khasia Hills—Griffith, T. Lobb; Nepal—Wallich; Sikkim-Himalaya, 5—6000 feet J. D. Hooker, (v. s. sp.)

Lindl. Sertum l. c.: Wallich met with in May 1818, at Toka in Nepal, called *Sunipiang*, where the name was taken by Dr. Buchanan Hamilton; all which were described by the late James Smith in Rees's Cyclop. under them appear to have belonged to *Bolbophyllum*. Rhizomate held down by numerous perpendicular roots as in Iris. From these spring in abundance small inversely pear-shaped pseudobulbs about 1" and terminated by a single leaf. Each leaf $\frac{1}{2}$ " long, oval lanceolate, flat, shining, firm, double-toothed at the point, contracted at the base into a short channelled petiole. Scapes spring from the base of pseudobulbs, very slender, erect, rigid, brownish green, hardly thicker, than piece of twine, clothed with a few long narrow sheathing scales. These are terminated by distichous spikes, which are drooping, 6" long. Flowers exactly alternate in distichous manner, yellowish purple, nearly parallel with the flattened rhachis, which is half surrounded below each flower by a single bract, dry ovate, concave, acuminate, striated, sometimes expanded into an ovate obtuse lobe on each side. Flowers twolipped, much shorter, than the bracts, partially hidden by them. Sepals ovate, obtuse, slightly tinged with pink, the lateral ones the largest, and placed next the rhachis at the back of the labellum. The petals are roundish, ovate, white, very obtuse, thrice as short as the sepals. Labellum fleshy, tinged with pink, tongue-shaped, blunt, much shorter than the sepals, and a little dilated near the base, where the margins stand erect, producing something the appearance of a shoe. Column short, not at all extended at the base into a foot, but quite continuous with the ovary; in front it is hollowed out into a stigma and at the summit it bears the anther. From unusual structure of the anther the genus derives its principal distinguishing feature. Instead of being loose in the antherbed; hinged by its back and opening along with its under side so as to allow the pollen masses to drop out upon the antherbed, it is so fastened down by its face, that the latter operation becomes impossible and in order to provide for the escape of the pollen, the cells open vertically, so that when their sides are drawn as under the pollen masses are at once seen reposing in their places. Pollen masses themselves are 4, adhering in two pairs, and according to memoranda made since, they are attached to 2 caudicles the nature of whose connection with the stigma is not yet known.

1438/1. **ACROCHAENE** Lindl.

Folia l. Jan. 10. 1853.

Sepala explanata, membranacea, lateralibus majoribus triangularibus columnae pedi producto adnatis. Petala minora. Labellum cum pede

columnae articulatum, membranaceum, complicatum, inappendiculatum, in columnam incumbens. Columna nana, mutica, basi longe producta. Pollinia 2, globosa, apice rima verticali fissa, caudiculis totidem teretibus apice contiguus adnata. Glandula 0. Anthera membranacea, incumbens, 1-ocularis. Herbae epiphytae, Indiae septentrionalis, pseudobulbosae. Folia coriacea. Racemi radicales, erecti, laxe vaginati.

What the true position of this and *Sunipia* may be is open to some question. The presence of a tough terete caudicle to each pollen mass points to *Vandaeae*; but there is certainly no free gland. The habit of the only species is peculiar.

1. *ACROCHAENE PUNCTATA* Lindl. l. c.:

Pseudobulbus ovatus. Foliolum solitarium, coriaceum, oblongum, $\frac{7}{2}$ unciale, petiolo $3\frac{1}{2}$ unciali. Scapus radicalis, folio brevior, basi laxe vaginatus, squamis patulis lineari-lanceolatis membranaceis vestitus, apice racemosus. Bracteae squamis conformes, ovario vix aequales. Flores straminei, sanguineo-punctati. Sepalum dorsale erectum, ovatum, obtusum; lateralia triangularia. Petala uninervia, fimbriata. Labellum complicatum, trilobum; lobis lateralibus erectis obsolete serrulatis, intermedio recurvo plano obtuso.

Wild in the Sikkim — Himalaya, at the height of 4000 feet—J. D. Hooker. (v. s. sp. et ic. pict.)

1438². **IONE** Lindl.

Folia l. Jan. 10. 1853. Haec:

Sepala membranacea, basi aequalia, bilabiata, lateralibus parallelis saepius connatis, labello suppositis. Petala nana. Labellum posticum, integrum, sepalis majus vel aequale, margine membranaceum, medio striatum carnosum, saepius in apicem pugioniformem productum. Columna nana, semiteres, libera, mutica, basi producta. Pollinia 4, paria glandulis 2 distinctis cartilagineis ovalibus adnata. Herbae epiphytae, Himalenses, pseudobulbosae. Folia solitaria, coriacea. Scapus radicalis, spicatus. Bracteae membranaceae, nunc spathaceae, floribus longiores.

With the habit of a *Bolbophyllum* or *Didactyle*, this genus unites the glands and pollen-masses of an *Angraecum*. Its long membranous two lipped calyx, dwarf petals, and large lip, with a fleshy axis usually extended into a dagger-shaped point, are very unlike anything belonging to neighbouring genera. I see no reason for regarding the glands as of a different nature from those of *Vandaeae*, out of which this forms one of the transitions to *Malaxids*.

§. 1. *Latifoliae*; bracteis spathaceis.

1. *IONE CIRRHATA* Lindl.

l. foliis oblongis scapo aequalibus, bracteis cucullatis acutis ovarii longioribus, sepalis lateralibus connatis, petalis rotundatis integerrimis, labello ovato oblongo integro lineis 2 elevatis basi clavatis aucto.

Very much like the next; but the leaves are longer, and the lip is not serrated, but is marked by two elevated white lines, resembling the columnar cirrhi of a *Catasetum*. Flowers dirty white, with purple streaks and a deep violet lip. My account is almost wholly taken from Mr. Cathcart's figure in Dr. Hooker's possession.

Wild in Sikkim-Himalaya, at the height of 4000 feet — J. D. Hooker, (v. s. sp. et ic. pict. Cathcart.)

2. IONE VIRENS Lindl.

I. foliis oblongis planis utrinque obtusis scapo duplo brevioribus, bracteis ovatis acutis membranaceis distantibus ovario longioribus, sepalis lateralibus connatis, petalis acutis integerrimis, labello oblongo serrulato in apicem longum crassum teretem striatum producto.

Dipodous genus Griffith Not., p. 405; Ic. t. 328. fig. 1.

Readily known by its broad oblong leaves, about four inches long by one and a quarter wide, and by its distant bracts. The scape would seem always to be nodding. Griffith thus speaks of it: Leaves lively green. Scape fuscous below, becoming purple among the flowers, and green at the apex of the newer parts. Bracts whitish with purple veins. Lateral sepals white in the middle, with greenish edges, the white parts veined with purple. Petals purple and sanguine. Pollen-masses light yellow. Pseudobulb shrivelled.

Wild in the Himalaya, in the Mishmee hills—Griffith. (v. s. sp. comm. b. Griffith.)

2. IONE FUSCO-PURPUREA Lindl.

I. foliis angustis obtusiusculis scapo multo brevioribus, bracteis ovatis, acuminatis imbricatis ovario aequalibus, sepalis lateralibus liberis, petalis acutis, labello ovato cordato concavo membranaceo in apicem crassum teretem producto.

Dipodous genus Griffith Not. B. 405; Ic. t. 327. fig. 1.

Related to the last in the form of its lip, which is however more cordate, thinner at the edge, and with a more distinct tapering fleshy apex, but the bracts are not carinate, imbricate each other when young, and hardly reach beyond the ovary. (Peduncles light yellowish green. Ovary green. Pseudobulbs blackish. Sepals and petals light fuscous veined with bright purple. Lip the same, but less veined; apex tongue-shaped, light fuscous green on the sides, purplish at the edge. Bracts membranous. — Griffith.)

Wild in the Himalaya, trees on Thumathya in the Mishmee mountains — Griffith. (v. s. sp. comm. b. Griffith.)

4. IONE PALEACEA Lindl.

I. foliis angustis obtusiusculis scapo subaequalibus, bracteis angustis ovalibus obtusis imbricatis, adpressis, ovario subaequalibus, sepalis lateralibus connatis, petalis acutis serrulatis, labello ovato serrulato membranaceo in apicem longum crassum teretem producto.

Very like *I. fusco-purpurea*, but the scape is little longer, than the leaf, the bracts are long, narrow, close-pressed, and membranous, and the petals as well as labellum are distinctly serrated. Lip evidently purple. The flowers are twice as long, and much more membranous.

Wild in the Himalayas, Darjeeling — Griffith (v. s. sp. comm. b. Griffith.)

§. 2. Angustifoliae, bracteis membranaceis.

5. IONE KHASIANA Lindl.

I. foliis lineari-oblongis emarginatis scapo filiformi aequalibus, spica flexuosa, bracteis laxis angustis distantibus floribus aequalibus, sepalis lateralibus connatis, petalis rotundatis serrulatis, labello panduriformi-rhombeo obtuso medio serrato antice integerrimo lineis 2 elevatis secus medium.

Dipodium Khasianum Griffith Not. p. 354; Ic. t. 327. fig. 2.

A plant from three to four inches high, forming close tufts. Flowers small, with the two lateral sepals completely or nearly united. Sepals white, streaked with violet, lip deep violet with two white streaks, according to a drawing of Mr. Cathcart's.

Wild in the Khasia hills, 5—7000 feet — Hooker and Thomson; on trees at Nung-bree, Churra, Myrung, Amwee — Griffith, 1219. (v. s. sp.)

6. IONE BICOLOR Lindl.

I. foliis lineari-oblongis emarginatis scapis filiformibus duplo longioribus, spica flexuosa, bracteis laxis floribus brevioribus, sepalis lateralibus semi-connatis, petalis rotundatis serrulatis, labello panduriformi serrulato in apicem crassum teretem producto.

Sunipia bicolor LO. n. 2. Sert. Orch. frontisp. fig. 5.

A smaller plant, than the last. Scapes very short-stalked, not half the length of the leaves. Sepals white, acuminate, with three purple veins at the base. Petals white. Lip dark purple, with the point protruding in the form of a dagger-blade; in the Sikkim plant shorter than in that from Darjeeling.

Wild in Nepal — Wallich; Sikkim — Himalaya at 4—6000 feet — J. D. Hooker; Darjeeling — Griffith (v. s. sp.)

Obs. En descriptio ex Serto: Small patches of ovate pseudobulbs about as large as marbles, each of which is terminated by a narrow oval slightly stalked obtuse leaf, 3". Racemes are erect, rather longer than the leaves, originate from the base of the pseudobulbs; they bear about 9 small ringent flowers, arranged upon a flexuose, slender rhachis, each of which is sustained by a lanceolate, colourless bract, larger than the short obovate ovary. The sepals are white, slightly streaked with purple, ovate-lanceolate; 2 lateral ones being narrower and rather larger than the others, placed parallel with each other below the lip, and slightly adhering by their margins. Petals white, ovate, bluntish, rather more than twice as short as the sepals, with a faint purple streak at their base. Labellum deep purple, articulated with a very short foot of the column. Its general outline is cuneate; in the middle it is flat and fleshy and traversed by a sunke(?) line, at the margin it is foveated, at the apex rounded and emarginate; just above the base there is on each side a small erect auricle. All these things are described from the Indian drawing.

7. IONE CANDIDA Lindl.

I. foliis lineari-oblongis emarginatis scapis filiformibus aequalibus, spica subflexuosa, bracteis floribus brevioribus, sepalis omnibus liberis, petalis ovatis acutis ciliato-fimbriatis, labello ovato basi timbrato versus apicem serrulato in apicem longum crassum producto.

Flowers pure white.

Wild on the Khasia Mountains, at 5—6000 feet — J. D. Hooker and R. Thomson.

1438^{3/4}. **POLYSTACHYA** Hook.

Exot. Fl. 103. (LO. p. 72. sub Malaxideis, hinc Endl. 1366). — Epiphora Lindl.

1. POLYSTACHYA GALEATA Rchb. fl. Mss. *Dendrobium galeatum* Sw.1 *Bolbophyllum galeatum* L. O. 57. Huc: *Polystachya grandiflora* Lindl. in B. Mag. 3707:

Pseudobulbis parvis monophyllis, folio lineari-oblongo carnoso, pedunculo terminali subunifloro, flore recto (non resupinato), sepalis mucronatis; lateralibus quadruplo majoribus, petalis minutis oblongo-spathulatis, labello carnoso trilobo, lobo intermedio cordato acuto.

Labellum viridi-album, perigonium viride, rubro maculatum. — Sierra Leone.

2. POLYSTACHYA REFLEXA Lindl. Bot. Reg. XXVII. (1841.) Misc. 43:

Pseudobulbis conicis subcompressis annulatis, foliis —, scapo subclavato apice racemoso, sepalis expansis sub apice emarginato mucronatis lateralibus maximis, labello pandurato medio crenulato genuflexo pulvinato apice dilatato membranaceo.

A native of Sierra Leone, where it was found by Mr. Whitfield. It flowered in February in the garden of Chiswick House. Its leaves —. The flowers are white with a faint tinge of pink, and spread flat, so as to look at first sight very unlike those of a *Polystachya*. The lip is slightly tinged with green, abruptly bent back in the middle, and below the bend furnished with a bright yellow cushion of the most curious jointed hairs, which are arranged so compactly, that the whole seem to form one solid mass.

3. POLYSTACHYA OTTONIANA Rehb. fil. in Otto Hamb. Gtz. XI. p. 249. Epl. III. 217:

Aff. *P. grandiflorae*: *racemosa*? foliis lineari-ligulatis geminis ternisve, pedunculo ancipiti, labelli trilobi lobis lateralibus rectangularibus, lobo medio retuso, carinis carnis a basi in discum sparse puberulo farinaceum.

Pseudobulbus maturus pyriformis nitidissimus foete viridis, vagina lacera amictus. Folia lineariligulata, bipollicaria, seu longiora, apice inaequali acuta nunc violaceo marginata. Vaginae infimae nunc fusco marginatae. Pedunculus anceps — in specimine misso uniflorus, forsan (ex bracteis fatuis) demum racemosus; viridis, puberulus. Bracteae minute squamatae. Ovarium pedicellatum purpureoviolaceum, puberulum. Flos in specimine transmisso anticus. Sepala triangula, lateralia apice paulo deorsum curvula, lactea; basis sepalorum extus, limbus sepali dorsalis, nervi medii sepalorum lateralium purpurei. Tepala cuneato oblonga acuta, subbreviora, angustiora; latere inferiori medio obtusangula. Labellum labellatum, supra descriptum; carinis ac disco antico xanthinis. Gynostemium clavatum linea antice angulata supra basin xanthinam atropurpurea. Anthera purpurea. Pollinia semiobpyriformia, postice biloba sessilia in lamina cordata. Flos illi *Aganisiae* vix minor. Diese niedliche Orchidee ist geradezu hübsch. Die zolllangen Scheinknollen sind birnenförmig mit silberfarbigen Scheiden. Zwei bis drei lineale feste Blätter. Auf zweischneidigem dünn behaartem Blütenstiel eine hübsche Blüthe: so gross und so gefärbt wie die der lieblichen *Aganisia*; milchweiss mit Purpur eingefasst und gestreift, schön goldgelb auf der Lippe. — „Geruch einer verblühten Hyacinthe.“ Sie ist jedoch ein spröder Blüher, da sie seit 1847 erst 1855 wieder blüht. Ihr Vaterland ist nicht sicher bekannt.

Obs. Serius cognovi, esse *Pleurothallidem capensem* „Sonder Mss.“ *Lindleyumque illustrem hoc Loudini docui. Inde tantum ex verbis „sum-mum jus, summa injuria“ intelliges, ill. Lindley in Proceedings of the Linn. Society May 1862 p. 130 attulisse: „It has, however, the habit of Polystachya capensis of Sonder (P. Ottoniana Rehb. fil.)“*

4. POLYSTACHYA EXTINCTORIA:

Labelli laciniis lateralibus semifalcatis antrorsis lacinia media transversa submarginata, toto disco a basi angusta labelli in basin laciniae mediae furfuraceo, mento angustiusculo elongato, extintoriiformi, curvato, per lineam mediam emarginato.

Cranichis luteola Sw.? In Jamaica insula.

5. POLYSTACHYA NANA:

Labelli laciniis lateralibus ligulatis productis retusiusculis, lacinia antica semiovata, toto disco per totam longitudinem furfuraceo, mento obtusissimo omnino non extintoriiformi. Encyclia nana Pöpp. Endl. t. 113. A! *Analysae confusae!* Caespitosa. Radices adventitiae funiformes validae.

Caulis basi tumidus, vaginatus, di- — triphyllus. Folia ligulata apice minute biloba. Summa folia spathacea. Pedunculus anceps parcissime minuteque puberulus. Bracteae lanceae aristulatae flores aequantes perigonii clausi subglobosi. —

Peruvia subandina in arborum ramis sylvarum editiorum. Jan. 1830. (Cuchero), Pöppig! Ex parvulis! (Juxta typos).

6. POLYSTACHYA ZEYLANICA Lindl. Bot. Reg. XXIV. (1838). Misc. 144:

Caulescens, foliis oblongo-lanceolatis, panícula racemosa ramis elongatis, floribus glabris, sepalorum basi triangulari, labelli lobo medio rotundato apiculato disco furfuraceo in medio nudo calloso, capsula inter costas reticulata.

Dendrobium polystachyum Thouars O. Afr.

In both these plants the disk of the labellum is covered with a fine frost-like meanness: which is removed by the least touch. This meanness is a curious modification of the hairs found in other plants. When undisturbed it consists of threads with egg-shaped joints, which are filled with air; the surface of each joint is marked with wavy oblique striae, and the interior uniformly contains a nucleus, to which there appears to belong a circulating apparatus of the same nature, as that in the hairs of *Tradescantia* and other plants. I have not however succeeded in actually observing any circulation. But the slightest touch suffices to destroy the cohesion between the joints of these singular necklace-shaped bodies, so that when they are placed on the field of the microscope the latter appears as if covered with the eggs of some insect; it is only, when they are removed from the labellum with great care, that their real articulated structure, and their analogy with such hairs as those of *Tradescantia* is made out.

Obs. Huc forsán *Polystachya luteola* Hook.? Ex II. 103 (1825). — Definienda *P. Zeylanica*: labelli medio trifidi laciniis lateralibus acutangulis, lacinia antica semiovata lobulata, mento triangulo obtusato. R. fil.

7. POLYSTACHYA LUTEOLA Lindl. Coll. Bot. 20. (an Hook. Ex. II. 103?).

Labelli angusti laciniis lateralibus dentiformibus abbreviatis, lacinia antica semiovata crispula, toto disco multifurfuraceo, linea elongata callosa per medium, mento obtusangulo. — Haec est vulgatissima in Antillis, Surinamo etc. Rchb. fil.

Videtur omnino Lindleyana Coll. Bot. 20. (1821). Peraffinis est *Polystachyae zeylanicae*, quae eget jugo illo characteristico carinato et gaudet labello latiori, lacinia antica breviori.

Polystachya luteola Hook. Focke Tidsch. Wis. Nat. Watsch. 203:

Herba epiphyta caulescens. Caulis basi incrassatus ibique callosus. Folia oblongo lanceolata, acuta, plicata, multinervia, basi vaginantia, disticha, scapo breviora, apice recurva. Scapus composito spicatus, vel spica composita, caulem terminans, compressa, erecta, vaginata. Spiculae 1—3 pollicares, oblongae, remotae, densiflorae. Flores minuti, conferti, luteo virides, glabri, leviter adnati. Alabastrum trigonum. Sepala patula, lateralia cum basi producta columnae connata, basi obliqua, acuminata. Petala multo angustiora, linearia, subspathulata, conniventia, apice tantum recurva. Labellum posticum, cum pede longe producto columnae articulatum, trilobum, album lobo medio majore, plicato, acuminato, subito reflexo, lobis lateralibus falcatis conniventibus; disco ad medium calloso, a basi ad apicem usque dense glanduloso. Columna brevis, semiteres, in ovarium resupinata clinandrio utrinque excavato ad polliniam recipienda. Anthera subconica bilocularis septo interrupto. Pollinia 4, periparia cohaerentia, subrotunda, compressa, flava. Ovarium sulcatum, glabrum. Habit. in sylvis ad rivum Para, in ramis arborum. Mart. April.

Huc: *Polystachya luteola* Hook. α . angustifolia A. Rich. in Ramon de Sagra 246. Caule compresso subancipiti basi incrassato simplici glabro; foliis 2—3 inferioribus vaginantibus elliptico oblongis obtusis coriaceis, nunc caule dimidio brevioribus, nunc subaequalibus; floribus parvulis luteolis brevissime pedicellatis, nunc spicam simplicem, nunc spicas 2—3—4 alternas efflorentibus, fructibus oblongis sexcostatis.

Crescit in cortice arborum, nec non inter muscos et in detritis foliorum elapsorum in diversis Cubae partibus. (Ramon de la Sagra. J. Maria Valenzuela),

8. POLYSTACHYA FOLIOSA. Huc: *Stelis foliosa* Hook. Ann. of Nat. Hist. Vol. II. p. 330:

Nana, foliis subtribus lineari-oblongis, scapo folio brevior, spica subcompacta, floribus subcernuis, petalis lingulatis, sepala subaequantibus, labello trilobo, medio dense glanduloso.

Habit British Guiana, whence it was introduced in a living state by C. S. Parker Esq. — Column much shorter than the perianth, thick, fleshy, rhomboid. Anther hemispheric.

Huc: *Stelis foliosa* Hook. Focke in v. Schld. B. Z.: Folia plurima oblique emarginata, plicata. Scapus anceps, composito spicatus, vaginis griseis vestitus, spicis teretibus erectis brevibus viridibus. Flores bracteis minutis acuminatissimis viridibus suffulti. Capsula oblonga. Juni. Para.

Huc: *Polystachya Weigelti* Rehb. fl. in Linnaea XXV. 230:

Huc: *Encyclia polystachya* Pöpp. Endl. II. 113! (Analyses confusae!)

Huc: *Polystachya nana* Kl. (1853). Mss. in Semin. hort. Berol. 1853. N. 5:

Pseudobulbis parvis ovatis, apice attenuatis, squamis vaginantibus aridis vestitis, bifoliatis, foliis oppositis parvis anguste oblongis, apice subobtusis, inaequalibus recurvatis unicostatis, supra canaliculatis, in petiolum longum attenuatis; scapo terminali brevi, minutissime puberulo, articulatum deorsum attenuato; floribus in apice congestis minutis sessilibus e flavido-viridibus; perigonii foliolis semipellucido-punctatis, exterioribus ovatis acutis, interioribus spathulatis subacutis brevioribus; labello inferne trilobo, lobo medio aut acuto aut bidentato recurvo; columna perbrevis, intus excavata.

Planta erecta, bipollicaris. Pseudo-bulbi 4 lineas longi. Folia sesquipollicaria, 4 lineas lata. Scapus 7—8 florus. Flores flavo-virides, lineam longi. Cl. Wagener misit specimina sub N. 38. e Venezuela anno 1851. Floruit in horto Berolinensi M. Octob. 1853. (Kl.)

13. POLYSTACHYA ESTRELLENSIS Rchb. fil. Linnaea XXV. 231:

Caulibus secundariis elongatis (—), basi pseudo-bulboso-incrassatis, vaginatis, paucifoliis, foliis 4—6, oblongis, acutis (—9" longis, 1" latis); rhachi ramulosa, rhacheolis multifloris, bracteis ovatis acutis (0,5" longis, basi 0,3" latis), ovariis brevissime pedicellatis (2") brevioribus, perigonii phyllis lateralibus ovatis acutis (1" longis, basi 0,9" latis); lateralibus internis ligulatis obtusis, margine superiori nunc crenulatis, semipenninerviis (sc. nervulis abbreviatis marginem non attingentibus), aequilongis (0,3" latis), labello a basi cuneata angusto unguiculato in laminam trilobam explanato, calloso, callo carinaeformi margine libero superiori prope lunato a regione antebasilaris ad discum labelli, lobis lateralibus abbreviatis, medio lobo latiori retuso emarginato crenulato (1,1" longo, medio 1" lato), gynostemio brevissimo truncato.

14. POLYSTACHYA JUSSIEUANA:

Labelli lati laciniis lateralibus triangulis antrorsis, lacinia antica reniformi crispula, disco furfuraceo, tuberculo in basi antrorsum in carinam exeunte, mento obtuse acuto, pedunculo hispidulo. — Madagascar. Ex herb. Juss.!

15. POLYSTACHYA CEREALIS Lindl. Bot. Reg. XXVI. (1840). Misc. 208:

Pseudobulbis ovatis, foliis oblongo-linearibus undulatis, racemo simplici obtuso brevioribus, floribus cernuis, labelli trilobi pone basin callosi per axin pubescentis lobis lateralibus nanis, intermedio obtuso undulato.

Imp. from Oaxaca by Messrs. Loddiges (265.) The flowers, when full blown, have the colour and texture of old wax; they are distinctly drooping and arranged in a

very dense obtuse raceme about an inch long. In habit, size, and general appearance the species bears much resemblance to the *Encyclia nana* of Pöppig, which like *E. polystachya* of that author, is apparently a *Polystachya*, notwithstanding the manner in which the pollen masses are represented, about which I think there must be some error. In this plant there is a pair of pollen masses, excavated at the back and attached to a short caudicula and small gland.

16. *POLYSTACHYA PAULENSIS* Rehb. fil, Mss.:

Labello trifido, laciniis semioblongis, obtusis, lateralibus subbrevioribus subantorsis, mento obtusissimo. Plantula pusilla habitu et magnitudine *Polystachyae nanae* Rehb. fil.

In arboribus ad Hyta Provinciae S. Pauli. v. Martius. (Vid. in herb. Monac.)

17. *POLYSTACHYA MASAYENSIS* Rehb. fil, Bonpl. III. 217:

Aff. *Polystachyae cereae* Lindl. foliis lineariligulatis, racemo simplici nunc aequalibus, pedunculo ac ovariis puberulis, labelli trilobi basi ima furfuraceoallosi lobis lateralibus rotundatis, lobo medio producto retuso.

Planta tenuis basi pseudobulbosa. Folia lineariligulata — tripollicaria. Pedunculus pollicaris—quadripollicaris basi vaginis acutis ancipitibus scariosis 2—3 vestitus, superne dense spicatus. Bractee triangulae aristula brevissima. Sepalum impar lanceolatum; sepalalateralibus triangula; tepala linearia acuta. In summo monte Masaya. Am. centr. Oersted.

Var. *elatio* Rehb. fil. Bonpl. III. 217: Specimen foliis ligulatis quadripollicaribus et pedunculo quinquepollicari ramuloso, notis tamen speciei genuinae. Vultus *Polystachyae estrellensis* Rehb. fil. et *caracasanae* Rehb. fil. In Monte Masaya 3000'. Am. centr. Oersted.

18. *POLYSTACHYA CLAVATA* Lindl. Bot. Reg. XXVIII. (1842). Misc. 71:

Foliis lineari-oblongis obtusis recurvis canaliculatis, paniculae brevis strictae spicatae ramis clavatis, labelli carnosi lobo medio emarginato crenato lateralibus brevibus acutis, disco farinoso basi convexo.

Inconspicuous species from Beliza. Loddiges. Flowers pale yellow and small. The branches of a short panicle are fleshy, club-shaped, studded with sessile flowers.

19. *POLYSTACHYA AFFINIS* LO. 73. Bot. Reg. 1839. (XXV.) Misc. 44:

Flowers with Loddiges, who imported it from Sierra Leone. Extremely different from *P. puberula*, of which I once thought it might be a variety, and has larger flowers, than any of the racemose species of the genus. Sir W. Hooker has observed a gland and caudicula in my *Polystachya macrantha* (Bot. Mag. t. 7307.), which is probably the *Dendrobium galeatum* of Swartz; I had previously noted the same thing in *P. ramulosa* (Bot. Reg. 1838. Misc. 144) and I find a similar structure in the present species; it is therefore probable, that the genus *Polystachya* should be placed in Vandeeae, among the genera belonging to which subdivision a better station may be found for it than next to *Dendrobium*.

20. *POLYSTACHYA BRACTEOSA* Lindl. Bot. Reg. XXVI. (1840.) Misc. 102:

Foliis obovato-oblongis acutis in petiolium carinatum angustatis, racemo tomentoso oblongato cernuo basi ramoso, bracteis foliaceis acuminatissimis squarrosis, sepalis villosis, labelli ciliati trilobi per axin medium villosi lobo medio ovato acutiusculo.

A drooping *Polystachya*, with orange coloured flowers, imported from Sierra Leone by Messrs. Loddiges. Its leafy tapering squarrose bracts and downy flowers readily distinguish it.

Bot. Mag. 4161: Pseudobulbis subrotundis compressis aggregatis, folio unico petiolato oblongo-ovato acuto, racemo e summitate petioli nutante pubescente pedunculoque bracteato, bracteis (infima foliaceae) lanceolatis acuminatis concavis, inferiori-

bus florem aequantibus vel superantibus, petiolis obovato-oblongis glabris, labello lato-oblongo revoluto medio longitudinaliter villosa, lobo medio subrotundo. Flores flavi, sepala basi brunnea, labelli lobi laterales intus brunnei.

21. POLYSTACHYA RAMULOSA Lindl. Bot. Reg. XXIV. (1838.) Misc. 142:

Ebulbis, foliis . . . —, scapo paniculato, floribus glaberrimis, sepalorum basi conica elongata, labello cuneato trifido apice carnosum margine involuto, lobis acutis intermedio minore, disco plano imberbi.

Sierra Leone, whence it was imported by Messrs. Loddiges, who flw. it in Sept. 1838. It is a small green flowered plant, with the habit of *Polystachya luteola*, but more branched, and with branchlets at the base of its ramifications. The smooth flowers, prolonged at the apex (that is to say, at the base of the sepals) into a long cone, and the wedge-shaped naked lip, distinguish this from the other species previously known. The apparatus connected with the pollenmasses is very remarkable; in this plant the masses are two waxy bodies obliquely divided half-way into two very unequal lobes, and adhering to a long white wedge-shaped separate process, which has all the appearance of the caudicula of a *Vandea* genus, and which is moreover attached to a minute separable gland; a trace of this structure also exists in *P. luteola*, and is probably what Sir W. Hooker saw when making the drawing of Ex. Fl. At first sight a fact like this would appear either to weaken the value of the distinction by which *O. pl.* of the *Vandea* are separated from those of the *Malaxid.* division, or to render it necessary to transfer *Polystachya* from the latter to the former. But upon an attentive examination of the structure of the process in question, it is seen, that it is not a cartilaginous elastic strap, adhering to a hard gland with a well defined outline, but a collection of large cells, loosely cohering, very convex, and filled with air; while the representation of the gland is a small hemispherical succulent mass, to which the cellules adhere. This process may therefore be regarded as a mere modification of the shapeless viscid matter to which the pollenmasses of many *Malaxideous* genera are attached.

22. POLYSTACHYA PUBESCENS Rehb. fil. Huc: *Epiphora* Lindl. in Comp. Bot. Mag. N. 19. p. 201:

Perianthium explanatum, labello postico. Sepala libera, lateralia aequalia. Petala forma diversa. Labellum carinatum, trilobum, cum columna sigmoideo-unguiculatum. Columna dorso prona, inversa, stigmatate verticali, margine trituberculato, basi paulo producta et cum labello articulata. Anthera unilocularis. Pollinia 4, caudiculae lineari affixa.

Herba epiphyta, *Polystachya*e facie, subbulbosa. Racemi terminales.

Epiphora pubescens Lindl. l. c.:

Super arbores inter Kovi et Kaprivier, also near Graham's Town Burchell. Epiphyta palmaris. Folia bina, oblongo-linearia, plana, apice paulo obliqua. Racemus terminalis, folio longior, 7—8florus, cum ovariis pubescens. Flores verosimiliter lutei. Sepala lateralia lanceolata, acutissima, nullo modo obliqua; supremum oblongo-lineare, concavum apiculatum. Petala paulo breviora, plana, obovata, obtusissima. Labellum pagina superiore nuda.

I hardly know, where to station this very distinct genus. Its habit is that of *Polystachya*, but it belongs to *Vandea*. Perhaps it had best be placed near *Maxillaria*, on account of the protracte base of the column; but there is no obliquity whatever in the lateral sepals. To *Cymbidium* it likewise approaches, but its labellum and very curious column distinguish it from all the members of that heterogenous genus. It was found by Mr. Burchell in the Caffre Country and is N. 3590 of his Herbar.

Lindl. Bot. Reg. XXVI. (1840.) Misc. 103: Originally found by Dr. Burchell in the Caffre country, afterwards collected by Drège, has lately flowered with Messrs. Loddiges, who imported it from Delagoa Bay. It grows about 6" high, and has an

anapituous flexuose scape, terminated by a few fragrant bright yellow flowers streaked with red. It approaches very near to the genus *Polystachya*, next to which among *Vandea* it must be placed. The inside of the little trident-shaped lip is bearded with long hairs.

Species exclusae.

Forsan *Hexadesmia*: *Polystachya minuta* Rich. et Gal. Ann. sc. nat. 1845. p. 27. *Minima pseudobulbo ovoideo-oblongo, sulcato, 1-phylo; folio lineari apice obtuso, floribus minimis in axilla folii solitarii, labello sessili ovali obtuso.* Ibid. p. 29. Mexico.

Sine dubio *Chloidia polystachya* Rehb. fl. (*Serapias et Neottia polystachya* Sw.) est *Polystachya membranacea* A. Rich. Ramon Sag. (*N. flava* Sw. = *Chloidia flava*!)

Obs. Etiam in Florida videtur occurrere *Polystachya*, forsán luteola, nisi Hook., tamen Lindl. Vestigia quaedam, a domino Cabanis (ornithologo?) exstant in Musaeo Berolinensi. Cum idem *Epidendrum tampense* Lindl. legerit, res mihi sincera visa.

1440. **EULOPHIA** RBr.

Eulophus: B. R. VII. (1821.) tab. 573. sub *Lissochilo specioso* RBr.

„This genus in affinity comes nearest to those plants of South Africa at present referred to *Limodorum* and *Cymbidium*, namely *Limodorum barbatum*, *triste*, *longicorne*, and perhaps also *hians* of Thunberg (not however *Satyrium hians* Linn., which seems to be a *Disa*), *Cymbidium pedicellatum* and *aculeatum*. These along with several Indian species, especially *L. virens*, *carinatum* and perhaps *epidendroides* form a genus (*Eulophus*), related on the one hand to *Dipodium* (vid. *Prodr. flor. nov. holl.* p. 330), and essentially agreeing with *Lissochilus* in the structure of anthera, but sufficiently different from it in its trilobed crested labellum, which is neither cordate, nor connected at base with the column. In both these characters, *Lissochilus* equally differs from *Angraecum* of M. du Petit Thouars, which has also an elongated spur and a considerably different habit.

Eulophia RBr. Bot. Reg. VIII. (1832) t. 686. „for the outline of the genus and enumeration of the species we refer to Mr. Brown's observations on *Lissochilus speciosus*, vol. 7. fol. 578. of this work; where the name is written „*Eulophus*“, and has been now altered in the termination on the suggestion of its author.

Lindl. B. M. Comp. N. 19, p. 201: Sect. Desciscentes. In Gen. et. Sp. Orch. this section is characterized as having equitant leaves. I now find, that although in some species the leaves are truly so, yet that in many others, they are only folded together and carinate.

1. **EULOPHIA LISSOCHILOIDES** Lindl. Comp. Bot. Mag. N. 19. 203:

Foliis lineari-lanceolatis suberectis scapo brevioribus, racemo laxo 8—9floro, bracteis lanceolatis acuminatis patentibus, sepalis lineari-oblongis obtusis, petalis obtusissimis latioribus brevioribusque, labello trilobo laciniis lateralibus membranaceis ovatis, intermedia oblonga, subcuneata retusa carnosa, venis tribus lacerocristatis, calcare conico incurvo.

(Hb. Burchell No. 6764). In agro Zwellendam, prope Zoetemalks Rivier.

2. **EULOPHIA DREGEANA** Lindl. Comp. Bot. Mag. 19. 202:

Foliis ensiformibus acuminatis recurvis longitudine scapi, vaginis scapi laxis foliosis imbricantibus, racemo multifloro denso, bracteis lineari-lanceolatis ovariiis aequalibus, petalis oblongis tenuioribus acutis, labello oblongo trilobo lobis lateralibus rotundatis intermedia ovato plano venis disco cristato lamellatis calcare brevissimo ventricos.

Prope Vischriev in graminosis, inter Keiskamma et Omsamcaba, vulgaris. Drege. Rhizoma crassum, carnosum. Scapus pedalis. Folia parum breviora, versus basin unciam lata. Vaginae circiter 5, laxe cucullatae, acuminatae, striatae, verosimiliter foliaceae, internodiis multo longiores ideoque invicem imbricantes. Racemus palmaris. Flores magni, speciosi, sepalis pollicem longis, verosimiliter herbaceis; petala colorata.

This is by far the finest of all the Cape Eulophias, except *E. parvilabris*; it may follow *E. barbata*.

3. EULOPHIA PLATYPETALA Lind. Comp. B. Mag. 19. 202:

Foliis linearibus ensiformibus recurvis scapo triplo brevioribus, racemo oblongo 7—8-floro, bracteis membranaceis acuminatis cucullatis pedicellorum longitudine, sepalis oblongis acutis, petalis fere triplo latioribus aequilongis obtusis, labelli trilobi laciniis lateralibus ovatis planis, intermedia retusa undulata ramentaceo-cristata, calcare cylindraceo obtuso ovario subaequali.

(Hb. Burchell, N. 6611). In agro Zwellendam, prope Zoetemalks Rivier.

Vix pedalis. Scapus vaginis tribus distantibus acuminatis. Folia rigida.

4. EULOPHIA PARVILABRIS Lindl. Comp. Bot. Mag. N. 19. 201:

Foliis lanceolato-ensiformibus longitudine scapi laxis membranaceis striatis, racemo multifloro, bracteis oblongo-lanceolatis striatis, demum revolutis ovarii longioribus, sepalis lanceolatis acutis, petalis oblongis obtusis longioribus, labello sepalis duplo brevior complicate leviter trilobo ovato membranaceo, lamellis 2 parvis pone basin, calcare obtuso ovario duplo brevior.

Inter Omsamwubo et Omsamcaba.

Verosimiliter tuberosa, ut *E. ensata*. Bipedalis, robusta, vaginis scapi internodiis paulo longioribus. Folia sesquipollicem lata. Flores speciosissimi 14—15; sepalis verosimiliter herbaceis, petalis duplo latioribus et paulo longioribus. Labellum membranaceum in unico flore, quem vidi posticum, an semper? margine nullo modo crispo, aut plicato; venae omnes sunt immersae nec ulla adest appendix paginae, nisi lamellae 2 parvae breves truncatae versus faucem calcaris.

A noble species of which however I have seen only one expanded flower, the petals of which, in their dried state, are $1\frac{1}{2}$ " long.

5. EULOPHIA CLAVICORNIS Lindl. Comp. Bot. Mag. N. 19. 202:

Foliis lineari-ensiformibus recurvis scapo paulo brevioribus, racemo 5—6-floro, sepalis oblongo-lanceolatis acutis, petalis oblongis mucronulatis duplo latioribus, labello obovato obtuso trilobo; lobis lateralibus truncatis planis, intermedio crispo ramentaceo-cristato, calcare clavato ovario paulo duplo brevior.

Katberg. Drege.

At one time I took this to be *Satyrion hians* of Linnaeus; but the specimen of that species in the Linnaean herbar is either *Disa lacera* of Thunberg or some very nearly allied plant; so that the *Eulophia hians* of Sprengel has to be expunged from the system. I am, however, by no means certain, that *Limodorum hians* of Thunberg is not a synonym of this species.

6. EULOPHIA EMARGINATA Lindl. Comp. B. Mag. N. 19. 202:

Foliis lineari-ensiformibus scapo triplo brevioribus, racemo subsecundo multifloro, sepalis lanceolatis acuminatis, petalis paulo brevioribus obtusis, labelli trilobi lobis lateralibus ovatis intermedio obovato emarginato medio dense ramentaceo-barbato, calcare filiformi flexuoso ovario paulo brevior.

Inter Sohiloh et Windvogelberg. Drege.

Dist. from *E. clavicornis* by its very different lip, more expanded and larger flowers, narrower petals and longer spur.

7 *EULOPHIA OVALIS* Lindl. Comp. Bot. Mag. N. 19. 202 :

Foliis lineari-ensiformibus scapo parum brevioribus, racemo multifloro, sepalis lanceolatis acutis, petalis paulo brevioribus obtusis, labello ovali plano leviter trilobo medio parce barbato, calcare conico obtuso.

Ado, collibus graminosis Drege.

Also allied to *E. clavicornis*, but with a very different lip, which is flatter, thinner, and less bearded, than in any of the Cape species, except *E. cochlearis* and *parvilabris*. A span high.

8. *EULOPHIA TRISTIS* Spreng. Syst. Veg. III. 730 : Lindl. Bot. Mag. Comp. Mag. N. 19. 202 : Zuurebergen, inter Bethelsdorp et Vanstaadesnivier. Drege.

9. *EULOPHIA MICRANTHA* Lindl. Orchid. 184. — Comp. Bot. Mag. N. 19. 202 :

Inter Kuge et Zontagriviers in planitie calcarea; inter Bethelsdorp et Vanstaadesrivier. — Drege.

The lip of this species has a deep membrane something like the ligule of a grass, arising from the orifice of its short spur; it is probably analogous to the fleshy ridge found in a similar part in *Zygopetalum*.

10. *EULOPHIA COCHLEARIS* Lind. Comp. Bot. Mag. 19. 202 :

Foliis ensiformibus acuminatis recurvis numerosissimis, scapo ramoso terminali squamis longis acuminatis vaginato, perianthio carnoso connivente, sepalis ovatis acutis, petalis minoribus obtusioribus, labello cochleari indiviso crenato extus sulcato intus subbarbato, calcare brevi retuso ventricosos.

Outniqualand, ad margines sylvarum. — Near Hartenbosch, by Mossel Bay, Burchell.

Very like *E. micrantha*, but larger and with totally different lip. These 2 species resemble *E. lurida* in inflorescence and general appearance.

11. *EULOPHIA ENSATA* Lindl. B. Reg. 1147. — Comp. Bot. Mag. 19. p. 201 : Prope Kovi Drege.

12. *EULOPHIA MACROSTACHYA* Lindl. Orch. 183. Wight Ic. VI. 1667. 1668 :

Leaves oblong, acuminate at both ends, plaited, somewhat 3ribbed, scape simple, radical, longer than the leaves, sepals linear lanceolate, acuminate, petals conformable, broader, subundulate, lip suborbicular, threelobed, lateral lobes about the length of the shortened, deeply cleft middle one; two short plates near the base, spur short roundish, obtuse, inflated.

Flowers greenish yellow, lateral lobes of lip tinged and streaked with crimson lines, middle lobe yellow.

Neilgherries: Banks of the stream at Burllear. Ceylon.

Lindl. Bot. Reg. XXIII. 1837. 1972: Sepala et tepala viridia. Labellum intus croceum, rubro striatum punctatumve, extus albidum.

13. *EULOPHIA LURIDA* Lindl. Orch. 182. — Bot. Reg. XXI. 1836. 1821: Sepala lilacina. Tepala aqueose lilacina. Labellum luteum.

14. *EULOPHIA FILICAULIS* Lindl. in Ann. Hist. X. 1842. p. 184 :

Foliis — —, scapo gracillimo paniculato, bracteolis pedicellis multo brevioribus, sepalis petalisque linearibus obtusis, labello oblongo apice trilobo basi in cornu brevi producto, laciniis lateralibus brevibus, inter-

media oblonga concava crispa intus laevi venis quibusdam paulo elevatis, anthera bicristata

Mexico. Karwinski herb. reg. Monac.

A very slender graceful plant with the flowering stem $1\frac{1}{2}$ foot high.

15. EULOPHIA VIRENS R. Br. Lindl. Orch. 182. Wight ic. pl. Ind. Or. Vol. III. 913 :

Observatio. Omnino non intelligo, cur *Eulophia exaltata* Rchb. fl. in Lindl. Contrib. to the Orchidology of India ad *Cyrtoperas* relata fuerit.

Species exclusa.

Eulophia squalida Lindl. = *Cyrtopera squalida* Rchb. fl.

1441. **DIPODIUM** RBr.

Prodr. I. 330.

1. DIPODIUM PUNCTATUM R. Br. l. c. 331. B. Reg. XXIII. (1837). 1980.

2. DIPODIUM PICTUM Rchb. fl. Xenia II. 15. Huc: *Wailesia* Lindl. in Hort. Journ. Soc. IV. 1849, 262 :

Sepala et petala aequalia, patentia; lateralibus basi subobliquis. Labellum sellaeforme, cum columna parallelum, eaeque basi saccata adnatum, medio villosum, basi bidentatum. Saccus inappendiculatus. Columna brevis, truncata, semicylindracea. Anthera bilocularis. Pollinia 2, globosa, dorso excavata; caudiculis 2 linearibus, divergentibus, glandulae ovatae alligatis.

Herba epiphyta, caulescens, foliis distichis coriaceis; pedunculo multifloro laterali erecto. Java.

WAILESIA PICTA Lindl. l. c. et Paxt. Fl. G. XVI. 321:

Epiphyte. Habit of Vanda. Angrecum. Caulescent. Leaves long, in two opposite rows, coriaceous, channelled, three-ribbed, terminating in an acute nearly oblique point. Peduncle rising from the side of the stem, erect, nearly a foot long, deep purple, bearing from 9—12 flowers, each about an inch and a half in diameter, externally brightly spotted with crimson on a pale yellow ground; inside the spots only just show through. Sepals and petals spreading, narrowly oblong, blunt, very nearly alike in size, form and texture, except that the two lateral sepals are slightly oblique at the base. Labellum oblong, saddle-shaped, blunt, and coarsely woolly at the upper end, shaggy along the middle; at the sides it is smooth, and streaked with crimson; at the base it is flattened and downy, united by the edges to the column, so as to form a small sac, but destitute of any appendage within the sac except a small rounded callosity; above the sac on either side, it has an obtuse linear smooth tooth. Column short, stiff, truncated, deep yellow at the end, rounded at back and plain in front, where it is moreover hollowed out near the base and closely covered with a soft felt. Stigma small transversal oval space near the summit of the column. Anther whitish, placed obliquely in rear of the stigma with an ovate point and twocelled. Pollenmasses two, globular, partially two-lobed, each attached to a long, narrow diverging caudicle, holding fast to a common ovate gland.

Huc: *Leopardanthus* Bl. Cf. Walp. Ann. III. 562.

3. DIPODIUM PALUDOSUM Rchb. fil. l. c. *Wailesia paludosa* Rchb. fil. Bonpl. II. 1853. 1. Aprili:

Perigonio tenuiori, labello ligulato acuto ante basin bidentato, per lineam mediam barbato, gynostemio utrinque alato, ala rotundata.

Grammatophyllum paludosum Griff. T. CCCXXIII.

Folia chartacea, lanceolata acuta trinervia dense disticha in caule prope bipedali Pedunculi axillares elongati superne racemosi multiflori.

1442. **GALEANDRA** Lindl.

Bot. Reg. I. 1840. XXVI. 49.

Galeandra from galea, a casque, and ἀνθηρ, an anther; in allusion to the crested anther. At first sight this would seem to be a hybrid name, being constructed of two words belonging to different languages; but as galea itself is from the Greek γαλή, I hope critics will consider the name allowable.

Sertum Orchid. 37: Perianthium patens, petalis sepalisque subaequalibus ascendentibus. Labellum infundibuliforme indivisum vel obsolete trilobum, calcari intus lamellis (4) auctum. Columna erecta membranaceo-alata, clinandrio declivi. Pollinia 2, postice excavata, caudicula brevi, glandulae brevi divergenti bilobae adnata. Herbae terrestres et epiphytae, caulibus foliatis, racemis terminalibus. — I had suggested *G. Baueri* might be combined with the *Eulophia gracilis* B. Reg. and a third Sierra Leone plant by the funnel shaped undivided lip, the crested anther, peculiar form of the gland, to which pollenmasses are attached. These characters are essential to Galeandra, but also in part important and it is requisite for them to be combined with other peculiarities in order to constitute a really good genus. Of the characters to be rejected the crested anther is principal, of those to be added, the presence of 4 parallel plates upon the lip and a terminal inflorescence. *Euloph. gracilis* will in that case be excluded from Galeandra, and so perhaps will *G. extinctoria*, both which require further examination in order to determine whether or not they are to be stationed definitively in the genus *Eulophia*. *Zygopetalum* and some others nearly allied to Galeandra, involve some very difficult inquiries for which sufficient materials have hardly been as yet accumulated.

1. GALEANDRA EUGLOSSA Rehb. fl. in v. Schl. Bot. Ztg. 1852. 935:

Perigonii phyllis 5 lanceolatis apiculato-acutis, labello a rotundata basi producto, trilobo, lobis lateralibus medianis, acutangulis, lobo medio producto, ligulato, marginibus lateralibus repandulo, carinis tribus parvulis in basi lobi medii, calcari clavato labelli dimidium vix aequante, gynostemio semitereti, rectiusculo, postice in apicem angulate producto, rostello triangulo, producto, apice bidentato.

Blätter länglich, spitz, unten keilförmig. Blüten fast so gross, als bei *Eutophia guineensis*, Sierra Leone. Van Hees. Herr Van Houtte.

2. GALEANDRA JUNCEA Lindl. Ser. (1840). sub 37:

Tuberosa, caule stricto, paucifolio, foliis linearibus acuminatis trinerviis longe vaginantibus, racemo erecto multifloro, labelli lamina denticulata obsolete triloba rotundata, lamellis 4 pone basin contiguas, juxta medium incurvis exinde tribus serrulatis confluentibus.

Grassy plant about 2' high, with long narrow leaves, small pink flowers, tubers in size and form resembling the corms of a *Crocus*. Mr. Sch. found it in abundance in the Sawannahs adjacent to the River Berbice and Dr. von Martius in Brazil in fields near Almeirim in the Province of Para.

Lond. Journ. II. 1843. p. 672. — *Phajus rosellus* Lem. Walp. Ann. I. 781.

3. GALEANDRA DEVONIANA Lindl. Ser. (1840). 37:

Caule erecto simplici tereti polyphylo, foliis lanceolatis, trinerviis, racemo sessili erecto multifloro, labelli lamina ovata obtuse crenulata, lamellis 4 pone basin, antherae crista carnosa rotundata pubescente.

„At the banks of the Rio Negro, a tributary of the Amazon, where near Barcellon or Marina, we found it growing in large clusters on the trees, which lined the river, some times on the *Mauritia aculeata*, or even in the ground, where the soil consists of vegetable mould. Clusters sometimes 10—12' circumf. Stems 5—6', at the lower part purple, green higher. Equally near Harendauar or Podrero.

Lindl. in Lond. Journ. II. 1843. p. 672. — Lindl. Paxt. Fl. G. II. p. 180. N. 450: found again by Mr. Spruce at Sir Schomburgk's localities. — B. Mag. 4610. — Lem. Jard. II. 195. (Ad ic. Hook.)

4. GALEANDRA BAUERI LO. 186. Bot. Reg. 1840. XXVI. 49:

Caule simplici, foliis lanceolatis trinerviis, corymbo terminali pedunculato nutante foliis brevioribus, pedunculo squamis lineari-lanceolatis membranaceis vaginato, sepalis petalisque lineari oblongis acutiusculis; labello maximo antice emarginato apiculato crenulato, calcare ovario aequali.

Perigonium viride, labello centro flavum et extus flavum, antice purpureum.

French Guiana. Martin. Mexico. Kistapa, ten leagues from Melcatepec at the upper end of a dry ravine, terminating half way up the mountains in a south-west aspect. Ross. — Mexico. Hartweg.

Galeandra Baueri Paxt. 1847. p. 49. — Batem. Orch. Mex. et Guat. 19. (icon phantastica horribile florulenta foliis cauleque minus correctis). Guatemala Skinner.

5. GALEANDRA DIVES Rehb. fl. Warscew. Bonpl. II. 98:

Aff. *G. Baueri* Lindl. labelli lobo medio retuso lateralibus vix longioribus. — Folia lanceolata acuminata, spathae membranaceae vaginantes acutae, panicula flexuosa, bractae lanceolatae acuminatae scariosae ovariis pedicellatis triplo breviores, sepala ac tepala lanceolata acuminata subaequalia, labello transverse rhombeum apice late retusum, margine minute denticulatum; carinae 2 in fundo; postice in calcar ab ostio amplissimo tenui extintoriiformi ovarium pedicellatum adaequans productum.

Blüthen gelb, Lippe vorn purpurn, ausserdem Purpuranflug an den Hüllblättern. Wir halten nach reiflicher Erwägung diese Pflanze für verschieden von *G. Baueri* welche einen völlig verschiedenen Biss der Lippe besitzt, deren Hüllblätter kürzer sind, als die Lippe. Als Abbildung der *G. Baueri* Lindl. citiren wir zunächst Lindl. Orch. by Bauer, Nr. VIII. — N. Granada. Warscewicz. — *Galeandra Baueri* var. *flora luteo*. Hook. M. Mag. 4701.

Huc: *Galeandra cristata* Lindl. Bot. Reg. XXX. (1840). Misc. 69:

Sepalis petalisque lineari lanceolatis reflexis, labello convoluto margine crispo intus pubescente et basi bicarinato, calcare acuminato horizontali, antherae crista rhombea unguiculata.

Cayenne, imp. Lodd. (1308). Habit of *G. Devoniana*, but the flowers are much smaller and paler, and the anther has a very singular crest, resembling a purple lozenge mounted on a white shaft.

Obs. Si quidem hanc non cognovi ex Lindleyana diagnosi, ipse ill. Lindley fuit causa. Nam planta, cui habitus *Galeandrae* Devonensis adscribitur, non praebebit effigiem *Galeandrae* Baueri.

6. GALEANDRA STANGEANA Rehb. fil. Bonplandia IV. 323.

7. GALEANDRA BOULIAWONGO Rehb. fil. in v. Schl. B. Z. 1852. 935:

Pedunculo valido plurifloro, bracteis ovatis acutis, ante apicem utrinque emarginatulis, pedicellis bracteas magnas pollicares superantibus, ovarii fusiformibus, perigonii phyllis externis lanceolatis acutis (reversis?), internis dilatatis oblongis acutis basi cuneatis, labello basi in calcar extinctoriiforme abbreviatum producto, ante medium trilobo, lobis lateralibus obtusangulis, lobo medio lato ligulato, retuso, crispulo, nervis elevatis medianis ante lobum medium productis, in carinas tres elevatas ibi abrupte desinentibus, gynostemio semitereti, anthera cristata, apice breviter bicorni.

Blüthen meist grösser, als die von *G. Baueri*, fast so gross als die der *G. Petersii*. Gobon. „Remède contre la Colique. On fait bouillir, et boit deux fois par jour. „Boulia Wongo.“ Ed. Jardin.

Huc: *Bollea* Rehb. fil., *Pescatoria* Rehb. fil., *Warscewiczella* Rehb. fil., *Kesfersteinia* Rehb. fil., *Promenaea* Lindl., *Huntleya* Bat. ex p.

§. 1. Uniflora.

Sert. I. *Bollea*: Columna naviculari, labelli limbo replicato, tumore maximo sulcato.

1. ZYGOPETALUM VIOLACEUM Rehb. fil. Mss. Huc: *Huntleya violacea* Lindl. Sert. (1839). 26:

Sepalis petalisque oblongis obtusis margine crispis, labello reniformi emarginato crista nuda sulcata, columna maxima carnosissima naviculari.

Demerara.

Tuft of leaves embracing each other at the base; blade is 8—9" long, erect, acute, between membranous and leathery in texture. Flowers 3" diameter. Two bracts. Peduncles 6 inches long. Sepals curved inwards at the point, crisped at the edges, the 2 lower are united by their bases into an inconspicuous pouch, outside pale soft violet fading to white, inside deeper and richer violet. Petals nearly the same. Lip united to the pouch of the lateral sepals by a short narrow foot, which curves upwards and dilates into the lamina; the latter is rich violet, kidney-shaped, with a little notch at the end, and slightly toothed. Column as large as the lip, fleshy, deep violet, broadest at the base, curved at the apex. Essequibo: on an island near the Cataract Cunaka toto or Silk Cotton Fall Schomburgk. (Journ. of Royal Geograph. Soc. VI. p. 232). (Ibi perit Schomburgkii amicus Reiss). Parad. Vindob. fasc. 13. — Lond. Journ. 1843. p. 672.

Bot. Reg. XXV. (1839). Misc. 17: Flowered with Mesrrs. Loddiges. Flowers are a deep rich violet, darker, than the darkest part of *Zygopetalum Mackaii*; 2—3" diam. tipped with greenish yellow, melting downwards into white, which soon confounds itself with the general tint of rich violet. — Van Houtt. Fl. Serres VII. 678.

Rehb. fil. in v. Schl. B. Z. 1852. 668. *Bollea*:

Perigonii carnosii phylla 5 oblonga subaequalia recte inserta, lateralia externa pedi gynostemii adnata. Labellum unguiculatum, cum pede gynostemii exacte continuum; unguis ligulatus, ecallosus; lamina basi cordata, dein rotundata, marginibus revoluta, callus in disco intrusus maximus, transsectione dolabriformis, costatus. Gynostemium seminaviculare, antice valde excavatum, marginibus antrorsis exalatis, carinaeformibus; androclinium perpendicularare, marginibus carnosio-elevatis; processus rostellaris dens medius linearis, corneus, lobi laterales membranacei, oblique extrorsum descendentes, stigma tegentes. Stigma semilunatum, sursum curvatum, limbo inferiore integerrimo. Apparatus pollinis *Zygopetali*.

Genus dicatum amicissimo cl. Dr. Bolle. *B. violacea* (*Huntleya violacea* Lindl.)

Lindl. G. Chronicle 1850. 1866: „Nothing can be a *Huntleya* without the great fleshy hooded column of *H. violacea*.“

Obs. Forsan huc planta mira, subfabulosa, *Monocerotis equi* socia dignissima, referenda est.

Lindl. Bot. Reg. XXIII. 1837. sub fol. 1991: *Huntleya sessiliflora* (Bateman ined.) „floribus, sessilibus.“ In Guiana Schomburgk. — Lindl. Sert. Nr. 26: *Huntleya* originally established by Mr. Bateman upon a Demarara plant received from Mr. Schomburgk and said to resemble the *Huntleya Meleagris* of Bot. Reg. — Lond. Journ. II. 1843. p. 672. *Huntleya sessiliflora* Bat. in Bot. Reg. sub t. 1991. British Guiana. Schomburgk.

Contra cl. Bateman in litteris March. 26. 1863. Biddulph Grange, Congleton: „I know nothing of *Huntleya sessiliflora*, indeed I never even heard the name till it was mentioned by You. There must be some mistake in the matter.“

Sect. 2. *Pescatoria*: Columna gracilis, semiteres; labelli limbus replicatus callo maximo gyroso insculpto.

2. ZYGOPETALUM CERINUM. Huc: *Huntleya cerina* Lindl. Past. Fl. G. III. (1851). 62:

Sepalis subrotundis concavis, labello ovato convexo, retuso, crista crassa semicirculari truncata plicata, columna apice nuda.

Firm, whitish, waxy blossoms, not unlike those of *Maxill. Harrisoniae*. Veraguas by Warscewicz. — Chiriqui Volc. 8000'. General appearance of the *Huntleya violacea*. Flowers rise singly from the base of the leaves upon a peduncle about 6' long with a few short tubular bracts 3 inches across, the sepals are rounded, and even at the edge, of a very pale straw colour. Lip is somewhat ovate, convex, indented at the point, much more yellow and furnished near the base with a deep thick semicircular ruff, composed of numerous plaits and folds. The column is deep violet near the base, has no expansion or hood over the anther.

Huc: *Pescatoria* Rehb. fil. in v. Schl. Bot. Ztg. 1852. p. 667:

Perigonii subcarnosi phylla 5 cuneato-obovata, acutiuscula, tria superiora recta, lateralia externa oblique in pede labelli inserta. Labellum unguiculatum, unguis ligulatus, media basi carinatus carina triangula, basi utrinque triangule auriculatus, sub angulo obtuso in basin gynostemii excavatam introrsus (uti ipsissima labelli basis in *Miltonia spectabili*). Lamina triloba, lobi laterales trianguli, erecti, disco carnoso utrumque conjungente; discus medio longitudinaliter carinatus, antrorsum rotundatus, multicristatus, cristulae obtusatae, oblique imbricatae; lobus labelli medius rotundatus revolutus, ipso limbo revoluta a lobis lateralibus erectis separatus. Gynostemium aequaliter semiteres, antrorsum excavatum; androclinium prope perpendicularare, apice productum, immarginatum; processus rostellaris trilobus, dens medius linearis, corneus, lobi laterales membranacei, integri, stigma tegentes. Stigma ellipticum, limbo inferiore trilobulato. Apparatus pollinis Zygopetali.

Genus dicatum praenobilissimo *Pescatore*, Orchidearum cultori celeberrimo. *P. cerina* (*Huntleya cerina* Lindl.)

3. ZYGOPETALUM TRIUMPHANS. Huc: *Pescatoria triumphans* Rehb. fil. v. Warscew. Bonpl. II. 97:

Labelli ungue brevissimo, callo labelli antice gyroso plicato.

Perigonium explanatum, sepala ovata apiculata, tepala angustiora, basi cuneata, labelli unguis ligulatus, discus rhombeus, postice planus, per lineam mediam pluricarinatus, limbo antico gyroso plicatus, lamina oblonga postice utrinque ad angulos disci rhombos extrorsos utrinque humerata, antice angustata apice retuse biloba, tota arpo-phylloacea, gynostemii prope apodis auriculae ligulatae utrinque in basi. Blüten so gross, wie die der *P. cerina*, schneeweiss. Lippe und Spitzen der Hüllblätter stabilblau; Säule und Lippennagel goldgelb. Blätter länglich-spitzlineal. Ein wunderbar schönes Seitenstück zu dem prächtigen *Zygopetalum aromaticum*. Neu-Granada. v. Warscewicz. — Rehb. fil. Xenia I. Tab. 11.

Sect. 3. *Cochleare*: Columna gracilis semiteres. Labellum explanatum callo plicoso gyroso. Caudicula linearis.

4. ZYGOPETALUM FLABELLIFORME Rehb. fil. Mss. Huc: *Cymbidium flabelliforme* Swtz.! Fl. ind. occ. 1471. *Zygopetalum cochleare* Lindl. Bot. Reg. XXII. (1836). 1857:

Foliis obovato oblongis plicatis, pedunculis unifloris radicalibus multo longioribus, sepalis petalisque ovato lanceolatis conniventibus, inferioribus majoribus, labello cochleato subrotundo bilobo crista transverse crenata, anthera ecristata. Trinidad. — Hook. B. Mag. 3585: pseudobulbo nullo, lobis late lanceolatis, scapo unifloro, sepalis petalisque oblongis subaequalibus, labello subquadrato basi ventricoso lateribus inflexis crispatis callo baseos lunato depresso antice crenato. *Eulophia cochleata* Hort. Knight. Probably Brazilian.

B. Reg. XXV. (1839) 14. (sub *Huntleya Meleagride*):

Mr. Rollisson assures me, that he received his specimen from the same country as that, which produced the *Zygopetalum cochleare* fig. in this work, pl. 1857, if so, I must have been misinformed as to Trinidad being the native country of the later as more disposed to believe that such was really the fact, because I find a drawing of what is apparently a luxuriant specimen of *Z. cochleare*, among Mr. Descourtilz's coll. gathered in Brazil, on the high mountains separating the province of St. Paul's from that of Minas Geraes, and known by the name of the Mantiqueiras, where it flowers in the hottest season.

Cf. Rehb. fl. in v. Schl. Bot. Z. 1852, 714: *Warszewiczella cochlearis* (*Zygopetalum cochleare* Lindl. *Huntleya imbricata* Hort. Hamb.), l. c. 765: *W. cochlearis* Rehb. fl. supra p. 714:

Labello brevissime unguiculato, subquadrato, angulis baseos obtusatis, hümeratis, angulis anticis obtusatis, basi foveata, lamina transversa trapezoidea denticulata in basi.

Zygopetalum cochleare Lindl. Bot. Reg. 1851. B. Mag. 3595. *Huntleya imbricata* Hort. Hamb. *Zyg. conchaceum* Hoffg. — Bonpl. II. 15.: Caracas. Oct. 3000'. Höchst selten. Wagener.

Sect. 4. *Warszewiczella*: Columna gracilis semiteres. Labellum explanatum callo planiusculo tabulari. Caudicula basi utrinque abrupte angulata.

Huc: *Warszewiczella* Rehb. fl. in v. Schl. B. Z. 1852, 635:

Perigonii phylla lanceolata, oblique inserta, externa phylla marginibus tantum phylla interna alabastrorum imbricantia, nec omnino tegentia. Labellum cum pede brevissimo gynostemii continuum, brevissime unguiculatum, dilatatum callo depresso, subtus libero, basi infima (et lateribus) adnato in ima labelli basi. Gynostemium clavatum, antice excavatum, superne marginibus subalato-marginatum; androclinium immarginatum, perpendiculare, magnum; rostellum dens medium lineari-subulatum, longus, ultra stigma transversum lunato-lineare productum. Anthera depressa, cornea, basi subtriloba. Pollinia quaterna, depressopyriformia, per paria incumbentia; caudicula ligulari, basi utrinque angulata; glandula rhombea. Maxillarideae habitu Chondrorrhynchae epseudobulbes, pedunculis unifloris.

Diese Gattung unterscheidet sich von *Warrea* durch die schiefe Anheftung der Hüllblätter, die vorn ausgehöhlte, oben keulige Säule, die beiderseits in Spitzen ausgehende caudicula und die eigenthümliche Lippenplatte, die mit den aufrechten Leisten der ächten *Warrea*-Arten (*W. tricolor* Lindl., *cyanea* Lindl., *bidentata* Lindl.) nichts gemein hat. — Viel näher steht die Gattung der *Chondrorrhyncha*: diese hat ein längeres Kinn, der Schiefstand der Hüllblätter ist viel bedeutender und die Lippe trägt keine Platte am Grunde, dafür ein kleines dreizähntes Leistchen in der Mitte. Die Säule ist nicht vorn gehöhlt. Die Narbendecke ist dreizähntig, seitliche Zähne herabgeschlagen. Die Caudicula kurz, stumpf fünfeckig, breit. Pollenmassen höchst ungleich.

Rehb fl. l. c. 765: Wie ich vermuthete, gehört *Zygopetalum cochleare* Lindl. wirklich hierher. Der Gattungscharakter muss daher wesentlich geändert werden. Der Schiefstand der Hüllblätter muss ganz wegbleiben, da er bei *W. marginata* geringer ist und bei *W. cochlearis* fehlt. Die Caudicula ist hier kurz, rautenförmig. Die Gestalt, der Durchschnitt (!) der Säule, die eigenthümliche Art und Stellung des übergreifenden Lippenwulstes müssen hinreichen zur Trennung dieser Gattung.

5. ZYGOPETALUM LUEDDEMANNIANUM Rehb. fl. Mss. Huc: *Warszewiczella Lüddemanniana* Rehb. fl. in Otto Hamb. Gartenztg. 1860, 180.

6. ZYGOPETALUM AROMATICUM Rchb. fil. in v. Schl. B. Ztg. 1852. 668:

Pedunculo abbreviato erecto unifloro, flore magno, specioso, perigonii phyllis 5 lanceolatis, acutis, torto undulatis; labello prope sessili, basi utrinque auriculato, auriculis obtusatis, callo magno antrorsum semilunato, multisulcato in basi, transgrediente in labelli laminam a basi angusta subito obreniformem, margine multilobulam, crispulam, disco omnino epapilloso; gynostemio graciliori, androclinio triangulo, marginibus stigmatum maximi productis subquadratis.

Blüthen grösser, als bei *Zygopetalum Mackayi*. Die fünf Hüllblätter schieeweiss. Lippe azurblau, am Grunde purpurfarbig. Säule weiss mit Purpurstreifen. — Blätter länglich, spitz, am Grunde keilförmig. Trugknollen scheinen zu fehlen. — Mittelamerika. — *Warszewiczella aromatica* Rchb. fil. in hortis.

7. ZYGOPETALUM MARGINATUM Rchb. fil. Mss. Huc: *Warszewiczella marginata* Rchb. fil. in v. Schl. B. Z. 1852. 636:

Labello a basi cuneato, dilatato, trilobo, lobis lateralibus oblongis, antrorsis, lobo medio producto, bilobo, lamella basilari foliacea, oblonga, bidentato-emarginata.

Huntleya marginata Hort.

Warrea marginata Rchb. fil. in litt. Gelblich weiss. Die Lippe hat einen violetten Rand des Mittellappens und dergleichen Zeichnung am Fuss der Säule. — Mittelamerika.

Rchb. fil. l. c. 836: Nachdem ich viele Blüthen erhalten, finde ich die grosse länglich viereckige Platte auf dem Lippengrunde oft 8–10-zählig, während die zweite erhaltene nur 2 Zähne hatte.

Rchb. fil. l. c. 765: Ganz frische Blüthen zeigen rein weisse Hüllblätter, die Spitzen der seitlichen inneren sind zart gelbgrün angehaucht. Der Lippenrand schön violett. Die Platte des Lippengrundes ist violett gestreift und einzelne solche Streifen ziehen sich über die Scheibe der Lippe.

Rchb. fil. Bonpl. III. 67: S. Pedro, Aspasica. März. April. 4–8000'.

Huc: *Warrea quadrata* G. Chronicle 1853. 647:

Labelli lobo medio orbiculari recluso, lateralibus semiovatis conniventibus, appendice carnosa subquadrata sulcata, apice obtuse tridentata.

Near *W. discolor* in habit and general form. Flowers larger, more fleshy, with no purple except upon centre and upper half of lip. Otherwise the blossoms are a clear uniform straw colour, with a green tip to the sepals. It is essentially known by the appendix at the base of the lip bearing nearly square, about 3 toothed in front and deeply furrowed. That of *W. discolor* is uniformly digitate. Jackson of Kingston. Wild Central-Am.? Pseudobulbs ovate. Leaves pale green, 6" long, very obscurely veined, oblong, acute, flat, except at the base, where they are much narrowed and channelled. Peduncle not quite so long as the leaves, with one light sheath near the base, and a pair of nearly opposite very unequal bracts, from between which rises the solitary flower. The lateral sepals are abruptly bent back, but remain perfect, straight, with the lower edges auriculate and involute. The upper sepal is ovate oblong and quite erect. The petals have the same form and size as the last, but are rolled back above the middle. Of the lip, which is circular with a retuse termination, the edges are bent downwards so as to give it a somewhat angular appearance, and the lateral lobes are long enough nearly to meet over the column. The appendix at the base is slightly tinged with violet, the unguis is yellow with a slight tubercle, the column which is downy in front, is pure white.

Bot. Mag. 4766. Pescatorea I. t. 6. — Rchb. fil. Xenia I. Tab. II. 7–13. p. 61:

Radices crassae, cylindraceae plurimae, nidum quasi simulant. Vaginae et folia praecedentis. Pedunculi vulgo breviores paucivaginati, vix umquam erecti (uti in icone Bot. Mag.), sed antrorsi. Perigonium subcarnosum, Sepalum impar et tepala

apicibus suis reflexa; illa oblongo lanceolata acuta, haec subaequalia, paulo latiora. Labellum basi brevissime unguiculatum dein utrinque humeratum trilobum; lobi laterales obtusanguli nunc subbasilares, divaricati (fig. 7), nunc antrorsi, mediani (fig. 8.); lobus medius lato ligulatus medio sinu exciso bilobulus subtruncatus, utroque angulo obtusangulus. Lamella ante basin depressa, per discum nunc longitudinaliter impressa marginibus lateralibus integerrima seu unidentata, introrsum seu extrorsum curvata, antice polyodonta seu excise bidentata; inferne liberrima. Gynostemium transsectione semiteres superne clavatum, hinc subvelutium. Androclinium omnino declinatum. Rostellum inciso triangulum prominente dente lineari subulato. Anthera depresso mitrata antice retusa processu medio ligulato retuso. Pollinia oblonga depressa incumbentia sessilia in ligula terminali caudiculae oblongo ligulatae angulo utroque triangule prominenti. Glandula rhombea ab apice caudiculae obocelata. Stigma trapezoideum. Carinula in basi antica gynostemii. Perigonium albidum. Limbus labelli purpureo seu coeruleopurpureo praetextus striis quibusdam et in lamella et ante eandem. Gynostemii albedi basis infima citrina stria utrinque transversa superposita violacea.

8. ZYGOPETALUM VELATUM Rchb. fil. Mss. Huc: *Warszewiczella velata* Rchb. fil. et v. Warszew. Bonpl. II. 97:

Aff. *W. marginatae* labello quinquelobo, callo dorso carinato.

Sepala oblonga acuta, tepala cuneato obovata acuta, labellum a basi brevissime unguiculata utrinque postice rectilineum antrorsum oblongum, quinquelobum, lobo utrinque angulato laterali gemino, postico acutiore, lobus anticus abbreviatus, truncatus, obtusatus, callus in basi planus inferiori pagina liber, basi tantum affixus, subquadratus, lateribus 3—4-lobulatus, apice obtusato truncatus quadrilobulus, per lineam mediam carinatus, gynostemium incurvum, dorso velutinum, caudicula utrinque apice acutangula more generis. — Blüthe grösser, als die der *W. discolor*, weiss. Lippe purpurn gesäumt und eben so auf der Scheibe gestreift. Nächst *W. marginata* (*Warrea quadrata* Lindl.), aber durch Lippenumriss und den Kiel auf der Platte am Grunde der Lippe sehr gut unterschieden. v. Warszewicz.

Rchb. fil. Xenia I. tab. 23. I. 1—6. p. 60:

Planta more generis ebullis. Vaginae basilares a radicibus adventitiis crassis perforatae. Folia a cuneata basi oblongo ligulata acuta. Tepala cuneato obovata acuta. Labellum a basi brevissime unguiculata utrinque postice rectilineum et elevato marginatum, antrorsum oblongum, quinquelobum, lobo utrinque angulato laterali gemino postico acutiore, lobus anticus centralis abbreviatus, truncato bilobus obtusatus. Callus in basi planus inferiori pagina liber, basi tantum affixus, subquadratus, lateribus ima basi unilobulatus, dein angulatus, apice truncato quadrilobulus, per lineam mediam carinatus, per utrumque marginem tumido limbosus. Gynostemium semiteres, incurvum, dorso velutinum. Anthera depresso mitrata postice obtuse truncatoque apiculata, antice acutangula. Rostellum trilobum sinus incisus angustis; processus rostellaris medius lineari ligulatus acutiusculus. Caudicula utrinque basi acutangula more generis. Flos illo *Warszewiczellae marginatae* major, candidus. Labellum purpureo limbatum, et pari modo in disco striatum.

9. ZYGOPETALUM AMAZONICUM Rchb. fil. Mss. Huc: *Warszewiczella amazonica* Rchb. fil. et Warszew. Bonpl. II. 97:

Sepalis tepalisque lanceolatis acutis, labello a basi angusta late ovato, apice rotundato bilobo sinu acutangulo interjecto.

Blüthen zweimal so gross, als die der *W. discolor*, schneeweiss, die Lippe mit rothen Längsstreifen. v. Warszewicz.

10. ZYGOPETALUM DISCOLOR Rchb. fil. Mss. Huc: *Warrea discolor* Lindl. Paxt. Fl. G. I. 73. ic. xyl. 49:

Costa Rica. Sepals and petals pale lemon colour, tinged with purple, lip dull purple. Warszew. (fig. 49. lip magnf.).

Very distinct one flowered species, the leaves of which I have not seen. Sepals $1\frac{1}{2}$ — $1\frac{2}{3}$ inch long, straw coloured, the lower straight, concave and deflexed, the upper erect, rolled back at the point, pressed close the petals, and with them forming an arch over the column and lip. Lip has a nearly circular outline, but is so concave, as not to present that form until flattened: it is slightly trilobed, of a deep dull, velvety purple colour, white at the base, a roundish oblong, yellow appendage, which adheres to the lip and is divided at the edge into strong diverging teeth, five of which terminate so many distinct ribs. The colour is yellow, shaggy in front, with an anther sloping forward and a subulate rostell. The pollenmasses 4, plane convex, in pairs at the end of a broad, flat, thin caudicle, furnished on either side with a lateral tooth. (A singular monstrosity here occurred in the two posterior pollenmasses, which had grown together into one by a narrow neck). A remarkable species, the flower of which resembles a *Lycaste*, but their pollen apparatus and lip appendage is of *Warrea*. Upon this point it may be useful to explain, that in *Lycaste* the caudicle is subulate and the lip appendage a truncate plate near the middle lobe of the lip, while in *Warrea* the caudicle is broad and flat, and the lip appendage ribbed, fringed and stationed at the very base of the lip.

Lindl. Journ. H. Soc. IV. 265: Scapo unifloro? apice bracteis 2 inaequalibus, ovarii proximis quorum altera linearis, sepalis oblongis lateralibus rectis deflexis canaliculatis superne erecto apice revolutis, labello subrotundo obsolete trilobo emarginato concavo appendice adnato subrotundo oblongo pectinato.

Rchb. fl. in v. Schl. Bot. Ztg. 1852. 636: *Warscewiczella discolor*.

Labello a basi cuneato, dilatato, trilobo, lobis lateralibus obtusatis, intermedio latissimo, producto, bilobulo, lamella basilaris membranacea, medio carinata, antice in laminam marginem polydactylam excurrente.

Blätter länglich lanzettlich, spitz, 7—8 Zoll lang, nicht viel länger als der Blütenstiel. Aeussere Hüllblätter lanzettlich; blassgelbweiss, seitliche herabgeschlagen, innere breiter, aufrecht, schön violett. Lippe aufgerichtet, dunkel violett, am Grunde gelb. Säule hellgelblich, vorn violett. Am Fuss derselben ein Zähnen auf der Lippenwurzel. Mittelamerika.

11. ZYGOPETALUM CANDIDUM Rchb. fl. Mss. *Warrea candida* Lindl. Cf. Walp. Ann. III. 543. Addenda: Centre of lip purple, towards the edge blue violet, at the base white streaked with red. The leaves not more than nine inches long. Flowers grow as in *Huntleya* together. — Van Houtt. Fl. des Serres VII. p. 123. xyl. — *Pescatorea* 15.

Warscewiczella candida Rchb. fl. in v. Schl. Bot. Ztg. 1852. 636: Labello brevissime unguiculato, quadrato, angulis baseos extensis, acute triangulis, angulis anterioribus obtusatis, basi subsaccato, membranibus 2 supinis oblongis in baseos marginibus, lamina crassa triloba in media basi.

12. ZYGOPETALUM WALESIANUM Rchb. fl. Mss. *Warrea Wailesiana* Lindl. Journ. H. S. IV. 264: Scapo unifloro? sub flore bractea duplici acuta cucullata aucto, ovario subpubescente, sepalis petalisque ovatis acutis patentissimis, labello subrotundo laevi, appendice radiata libera. — Parahyba in Brazil.

Lindl. Paxt. Fl. G. I. 73. cum xyl. 48: Found by Mr. Gardner in an excursion to the river Parahyba in search of *Huntleya Meleagris*. Flowers as large as those of *Warrea cyanea*. Sepals are all somewhat reflexed, the lateral not straighter than the rest; petals are also bent back, so that no arch can be formed over the column. The lip is tinted with delicate violet along the middle, roundish, concave, wedged shaped at the base, not at all lobed, but so turned upwards at the edges as to look as if it was furnished with basal auricles. App. 5 radiating violet fingers, which are free from the lip except at their origin; at the sides the edge of the lip is also furnished with a thin, linear inflexed membrane. Column, pollenmasses of *W. discolor*. Journ. Hort. Soc. IV.

Sect. 5. *Kefersteinia*: columna gracilis, antice sub fovea carinata. Labellum magis cucullatum, quam in praecedente sectione.

Kefersteinia Rehb. fl. in v. Schl. Bot. Ztg. 1852. 633:

Perigonii patuli phylla oblonga, acuta, undulata, submembranacea, phylla lateralia interna retrorsum oblique inserta. Labellum cum gynostemii pede producto continuum, basi callosum. Gynostemium semiteres, apice clavatum, rectum, marginibus anticis alatum; androclinium perpendicularare ellipticum, immarginatum, apice rotundatum rostellari dente subulato; stigma lineare, transversum; carina longitudinalis a stigmatis labio inferiore ad medium gynostemium. Pollinia pyriformia, papyracea, excavatula, per paria incumbentia, valde inaequalia, in caudicula obtusa rhombea. Maxillarideae habitu Huntleyae, Chondrorrhynchae, epseudobulbes. Pedunculi uniflori. — Rehb. Xenia I. p. 66.

13. ZYGOPETALUM GRAMINEUM Lindl. Bot. Reg. XXX, (1844.) Misc. 15:

Foliis lineari-lanceolatis, scapo subunifloro capillari brevi ascendente, vaginulis laxis una in medio, duabus sub pedicello, labello subrotundo fimbriato tenui supra basin appendicibus 2 ovato-lanceolatis acutis aucto. Flores 3, Z. Murrayani magnitudine, magis membranacei. Scapus 2-pollicaris. Folia spithamaea.

Popayan in woods, rare. This is much smaller, than the other species and is the only one yet found west of the andes.

Lindl. in Orch. Lind. 1846. p. 13. „A bulbless epiphyte from the damp forests of Merida, 5000'. June. Flowers yellowish white, transparent; petals spotted with purple; lip veined with deep red.“ Nr. 1474. A broader leaved var. A beautiful little plant.

Kefersteinia graminea Rehb. fl. apud v. Schl. B. Z. I. c.:

Phyllis quinis oblongo-ligulatis, acutis, membranaceis, labello obtuse rhombeo, antico retuso, marginibus anterioribus denticulato-laceris, membranaceis, callo erecto clitelliformi bilobo, antice emarginato in basi, lobo utroque erecto, trapezoideo, 3—4dentato; gynostemii alis triangulis medianis.

Huntleya fimbriata Hort. Hamburg. nonnull.

Blüthenhülle grünlich mit Purpurstreifen und Punkten, Lippe ebenso mit Schwarzbraun und Purpur; um $\frac{1}{2}$ kleiner, als die der Promenaea Rollissonii. — Caracas.

Rehb. fl. Bonpl. II. 15. Caracas. Juni bis October. 6000'. Wagener. — Vgl. Lindley Folia Orchidacea IV. Cheiradenia: „Its true station would seem to be near my *Zygopetalum gramineum*, which is by no means the plant so called by Mr. H. G. Reichenbach.“ Ich habe ein Exemplar vor mir mit Herrn Lindley's Autograph (von Hartweg gesammelt), ich habe die Beschreibung; des Herrn Lindley, zwei Exemplare Linden's mit der in den Orchideae Lindenianae citirten Nummer, zwei Exemplare jedesmal etiquettirt *Zygopetalum gramineum* Orch. Lind. von Funk und Schlimm gesammelt, von Linden vertheilt — die Beschreibung passt auf sie und alle andern, die ich sah, meine Beschreibung ist völlig richtig — und doch „by no means“!

Rehb. fl. Xenia I. 67. Tab. 25. II. 2—11: Planta habitu omnino praecedentis, sed folia paulo majora, nunc imo pedalia. Flores duplo majores, illis *Steniae pallidae* Lindl. vix tertio minores, in planta spontanea aequales. Mentum paulo majus. Sepala et tepala prope praecedentis. Labellum tamen a basi late cuneata seu statim dilatata rhombeum antice rotundatum, nunc apice paulo emarginatum; dimidio antico denticulatum seu fimbriatum. Callus baseos depressus carnosus, nunc rhombeus, nunc triangulus, dimidio antico grosse dentato, sinu semper in medio. Gynostemium semiteres, postice bene rotundatum, vertice obtusatum; anguli laterales in medio gynostemio utrinque et angulo prominuli pone foveae perpendicularis basin; rostellum

tridentatum supra foveam transversam sublinearem. Carina infrastigmatica magis conspicua, quam in antecedente. Anthera oblonga antice retusa, vertice postice rotundato nunc bilobulo. Pollinia depresso ligulata basi attenuata apice obtusata quadrigemina in caudicula ligulata apice utrinque acutangula, basi acuta. Perigonium membranaceo carnosum, viridulum guttis atropurpureis; macula conspicua saepe antice in apice labelli, callus in basi labelli atropurpureus. Varietas ex horto Schilleriano perigonio intense flavido maculisque purpureis insignis. — Van Houtte Flore des Serres IX. 102.

14. ZYGOPETALUM MORITZII Rehb. fil. Mss. Huc: *Kefersteinia stapelioides* Rehb. fil. apud v. Schl. Bot. Z. I. c.:

Præcedenti subaequalis differt labello magis rhombeo, rhombi dimidio inferiore minore, callo basilari minuto, reniformi. Alae gynostemii medianae, membranaceae. Mittelamerika.

Rehb. fil. Xenia I. 69. Tab. 25. III. 12—14:

Affinis *K. gramineae*: labello antice egregie retuso ultra angulos denticulato, callo minuto depresso triangulo apice bilobulo in ima basi: carina infrastigmatica maxima.

Sepala et tepala an exsiccatione minus crispula? Anguli gynostemii mediani. Reliqua præcedentis. Perigonium viride brunneo aspersum. Labellum flavido albidum, maculis atropurpureis. Caracas et Merida. Septembri — Decembri ac Februario. Moritz 1099.

Obs. Nomen „stapelioidis“ retinui pro *Maxillaria stapelioides* Link. — Rehb. fil.

15. ZYGOPETALUM SANGUIOLENTUM Rehb. fil. Mss. *Kefersteinia sanguinolenta* Rehb. fil. in v. Schl. B. Z. 1852. 635:

Perigonii phyllis 5 oblongo-ligulatis, acutis, membranaceis, labello flabellato, marginibus lateralibus integerrimis, margine anteriore emarginato, utrinque 3—5-lobulato, lobulis crenulato dentatis, callo basilari ligulato, antice tridentato, ima basi affixo, ceterum libero, depresso; gynostemii alis carnosis, apicem versus sitis.

Grünlichgelb, Lippe voll kleiner Purpurflecken. Moritz.

Rehb. fil. in Bonpl. II. 15.: Caracas, 4500'. October. Wagener. — [Rehb. fil. Xenia I. 67. Tab. 25. I. 1: Labello cuneato flabellato, callo basilari ligulato antice bidentato. — Radices adventitiae cylindraceae pro planta exigua conspicuae. Folia disticha cuneato lanceolata acuta glauca. Pedunculi tenues, bi—trivaginati apice bracteati uniflori. Flores illos *Maxillariae rufescentis* Lindl. subacquantes, tenue membranacei. Perigonium connivens. Mentum parvum. Sepala latius lanceolata acuta, tepala oblongo ovata acuta. Labellum cuneato flabellatum, apice lobulatum, undulatum, denticulatum; callus basilaris ligulato laminatus antice bidentatus. Gynostemium semiteres apice rotundatum angulis statim sub fovea utrinque angulatis. Androclinium et anthera et pollinarium genetica. Carinula infrafovealis abbreviata. Flores pallide straminei seu viriduli maculis areolisque sanguineis, callo baseos atropurpureo.

Sect. 6. *Promenaea*: Columna semiteres antice plana. Labellum trilobum basi cristato tuberculatum. Huc: *Promenaea* Lindl. Bot. Reg. XXIX. (1843.) p. 13: Sepala patula. Labellum trilobum, medio cristatum vel multo tuberculatum. Columna brevis, semiteres. Glandula ovata. Pollinia 4, geminata, sessilia.

16. ZYGOPETALUM STAPELIOIDES. Huc: *Maxillaria stapelioides* Lk. Otto Alb. III. 52. — Lindl. Bot. Reg. 25. t. 17. et Bot. Mag. 1812. 3877:

Pseudobulbis ovatis tetragonis 1—2phyllis, foliis tenuibus lanceolatis patentibus pallide glaucis reticulatis, pedunculo diffuso bifloro, sepalis

petalisque subrotundo-ovatis acutis, patulis, subaequalibus, labello oblongo trilobo, laciniis lateralibus erectis linearibus obliquis obtusis, intermedia ovato oblonga basi cucullata, transversa, crista flexuosa carnosus intus dente carnosus ovato aucta.

Perigonium viride purpureo striolatum. Lobus labelli medius purpureus. *Promenaea stapelioides* Lindl. B. Reg. l. c.

17. ZYGOPETALUM LENTIGINOSUM Rehb. fil. Huc: *Maxillaria lentiginosa* Lindl. Bot. Reg. 1839. Misc. 93. *Promenaea lentiginosa* Lindl. Bot. Reg. XXIX. 1843. p. 13:

Bracteis late ovatis acuminatis, labelli lobo medio ovato-oblongo obtuso, crista transversa medio processu quadrato tridentato aucta, antherae apice incurvo; alioquin *M. stapelioidi* similis.

Brazil.

Very like *P. stapelioides*; but the sepals are more acute, the purple spots redder, more distinct, and less run into bars; the lip is of the same colour, as the petals and its transverse crest has a square threetoothed process in the middle.

18. ZYGOPETALUM XANTHINUM Rehb. fil. Mss. Huc: *Maxillaria xanthina* Lindl. Bot. Reg. 1839. sub t. 17. *Promenaea xanthina* Lindl. Bot. Reg. XXIX. 1843. p. 13:

Pseudobulbis ovalibus tetragonis 1—2phyllis, foliis anguste lanceolatis, pedunculis ascendentibus unifloris pedicello sterili terminatis, bractea ovata mucronata cucullata, sepalis petalisque oblongis acutis patulis subaequalibus, labello oblongo trilobo, laciniis lateralibus erectis linearibus obtusissimis integris, intermedia bilabiata, labio superiore carnosus abbreviato truncato quinquentato, inferiore oblongo acuto.

Brazil.

Flowers yellow. Bot. Reg. XXV. 1839. 17. A plant called by Descourtiz „Epidend. Jonquille“ because of its colour, not its smell, for it is scentless, is an other. This was also found in the Organ Mountains by Mr. Gardner from whom I have a specimen (No. 656). Mr. Descourtiz found it on the high mountains of Ilha Grande on the side towards the sea, and exposed to the rising sun.

Rehb. fil. in v. Schl. Bot. Ztg. 1852. 662: *Maxillaria guttata* Hort.

19. ZYGOPETALUM GUTTATUM Rehb. fil. Mss. Huc: *Promenaea guttata* Rehb. fil. in Bonplandia IV. 323.

20. ZYGOPETALUM ROLLISSONII Rehb. fil. Mss. Huc: *Maxillaria Rollissonii* Lindl. Bot. Reg. sub fol. 1986. et 1833. t. 46. *Promenaea Rollissonii* Lindl. Bot. Reg. XXIV. 1843. p. 13:

Pseudobulbis subrotundis compressis subbifoliis, foliis oblongo lanceolatis acutis apice recurvis, scapis subunifloris diffusis laxè vaginatis, sepalis carinatis lateralibus basi subaequalibus, petalis acutissimis, labelli lobis lateralibus ovatis angustis acutis, intermedio oblongo membranaceo apiculato margine deflexo; callo disci elevato carnosus antice transverso lobos laterales labelli conjungente, medio producto truncato tridentato et denticulis reflexis postice fornicato truncato bilobo.

Brazil.

Flowers pale yellow, with purple spots on the lip. — Lindl. l. c. 1838:

Planta omnino facie *M. stapelioidis* colore minus pallido caesio. Folia nunc oblonga apice acuta recurva, nunc magis lanceolata; semper sessilia. Bractee cucullatae, acuminatae, ovarii longiores. Sepala et petala pallide flava, immaculata, conformia et subaequalia. Labellum flavescens, sanguineo guttatum; lobis lateralibus columnam utrinque aures ad instar adstantibus, margine posteriore crenulato. Crista labelli clavata, transversa, antice cornubus duobus clavatis armata, altero minimo intersecto, postice biloba, fornicata, utrinque dentata, denticulis quibusdam columnam re-

spicientibus latere jugi. Pollinia 4, per paria adhaerentia glandulae tenui rhomboideae.

§. 2. Racemosa.

Lindl. Bot. Reg. XXVI. 1840. 66: *Zygopetalum* differs from *Odontoglossum* by the crest of its lip being solid and transverse, by its column having no ears, and by its sepals and petals being directed upwards above the level of the centre of the flower.

Lindl. Bot. Reg. XXX. (1844). Misc. 15:

Perianthium explanatum, sepalis petalisque ascendentibus subaequalibus cum ungue producto columnae connatis. Labellum muticum, planum, indivisum, patens, ungue ascendente, crista magna transversa. Columna brevis, arcuata, marginata, saepius utrinque subdilata; nunc in cucullum expansa. Anthera subbilocularis carnosissima, nunc vertice rostrato. Pollinia 2, bipartibilia, in glandulam transversam subsessilia. Herbae terrestres, subcaules, foliis plicatis patentibus. Flores speciosi, suaveolentes, labello coerulescente.

21. ZYGOPETALUM BRACHYSTALIX Rchb. fil.:

Foliis lanceis acuto acuminatis inferne valide trinerviis, pedunculo elongato paucivaginato vaginis distantibus, racemo elongato, bracteis minutissimis, mento bene evoluto, sepalis oblongis acutis, lateralibus latioribus, tepalis ligulatis acutis, labello brevi unguiculato a basi minute cordata rhombeo flabellato obtusangulo, callo hippocrepico plicato sulcato in basi, columna brevissima. Flores illis Maxillariae rufescentis aequales. Ins. Trinitatis.

22. ZYGOPETALUM SELLOWII Rchb. fil. in Herb. Berol.:

Foliis ligulatis acutis, pedunculo paucivaginato, vaginis amplis triangularibus distantibus, racemo paucifloro, bracteis ovatis acutis ovariis pedicellatis plus duplo brevioribus, mento modico, sepalis ligulatis acutis, tepalis oblongo lanceolatis acutis, labello late cuneato, dimidio antico quadrato obtusangulo, toto ungue callo depresso striato antice utrinque obtusangulo medio denticulato oblecto, columna longiuscula.

Labelli lamina in sicca planta velutina. Flores illis Maxillariae rufescentis aequales. S. de Moeda. Sellow.

23. ZYGOPETALUM MURRAYANUM Gardn. in Hook. Bot. Mag. 3674:

Pseudobulbis ovatis profunde sulcatis, foliis lanceolatis striatis, racemis plurifloris, sepalis petalisque ovato-lanceolatis acutis immaculatis, labelli lobis oblongis, lateralibus erectis, intermedio quadruplo majore reflexo albo basi purpureo maculato callo prominente sulcato.

Perigonium viride, labello albo, callo flavo, lineis 5 violaceo brunneis stricto.

Organ Mountains. 4000' ab. level of the sea e Brazil. Gardner. Named by him in compliment of his steady friend Mr. Stewart Murray of the Glasgow B. G.

24. ZYGOPETALUM MAXILLARE Lodd. B. Cab. 1776. Hook. B. M. 3686:

Pseudobulbis oblongis sulcatis, foliis lanceolatis nervosis basi attenuatis, sepalis petalisque ovato-oblongis acutis subaequalibus, labelli trilobi obtuse calcarati lobis lateralibus erectis crista anguliformi crenata maxima unitis, intermedio patente majori subrotundo.

Perigonium viride, brunneo maculatum; labellum violaceum, columna violacea.

Mr. Gardner found it on the Organ mountains in April 1828 growing upon the stems of treeferns. — Lindl. Bot. Reg. XXX. (1844.) Misc. 15.

25. ZYGOPETALUM BRACHYPETALUM Lindl. Bot. Reg. XXX. (1844). Misc. 5:

Foliis ensiformi-lanceolatis scapo elato multifloro brevioribus, sepalis petalisque oblongis obtusis, labello transverso subrotundo emarginato basi vix angustato, callo integerrimo. Brazil.

Flowers most like those of *Z. intermedium*, but less than half the size. Sepals and petals are short, stiff, convex, and hardly acute, very much more brown, than green, in consequence of the blotches running together. The lip is entirely covered with blue veins and spots, firm, hardly at all narrowed to the base, and very little emarginate. — Lindl. Journ. H. Soc. IV. XII. Xyl.

25. ZYGOPETALUM MACKAII Hook. B. Mag. 2748. — B. Reg. XXX. (1844). Misc. 15: known from all the genus by its blue veined perfectly smooth lip and twolobed crest. The blotches on the sepals and petals are somewhat smaller than in other species. — Huc? Lond. Journ. 672. 820. *Zygopetalum Mackaii* Hook.? Roraima Brit. Guiana. Schomburgk. — Huc: Bot. Reg. XXX. (1844.) Misc. 15: *Zygopetalum intermedium* Lodd. B. Cab. 1136. *Zygopetalum velutinum* Hoffg. Bot. Z. 1835?

Foliis ensiformibus racemo brevioribus, sepalis petalisque oblongis acutissimis, labello subrotundo undulato basi angustato alte bilobo pubescente, callo crenulato indiviso.

Brazil. This is generally conf. in collections with *Zygopetalum Mackaii*, from which it is readily known by its downy labell.

Zygopetalon Mackayi Hook. Var. *parviflorum* Rgl. (*Z. intermedium* H. Petrop.) Mss. Ind. sem. h. Petrop. 1855.

Differt floribus subduplo minoribus, vix $1\frac{1}{2}$ pollices in diametro, sepalis petalisque vix undulatis, labello albo lineis tenuibus distantibus brevissime pilosis picto.

Zygopetalon Mackayi Hook. Var. *pictum* Rgl. (*Z. intermedium* H. Petrop.) l. c.:

Flores magnitudine formae genuinae, sepalis petalisque autem angustioribus, labello albo pulcherrime violaceo maculato pictoque.

Obs. Non intelligo, quomodo ill. Lindley *Zygopetalum intermedium* a *Zygopetalum Mackaii* pubescentia distinxerit, cum ipsum *Zygopetalum Mackaii* semper labello pubescenti non solum fuerit descriptum, sed vere gaudeat.

26. ZYGOPETALUM CRINITUM Lodd. Bot. Cab. 1682. Bot. Mag. 3402. *Zygopetalum pubescens* Hoffg. Bot. Z. I. 835? Lindl. Bot. Reg. XXX. 1844. sub Misc. 15:

Foliis lato lanceolatis, bracteis cucullatis, sepalis petalisque linearilanceolatis acutissimis, labello obovato emarginato basi longe angustato venis villosissimis, callo angusto incurvo emarginato.

Brazil. Varies with pink, blue and almost colourless veins to the lip. They all agree in having these veins quite shaggy, and a lip which instead of being broader, than long, narrows very sensibly towards the base.

Huc: *Zygopetalum microtos* v. Hoffg.!

Huc: *Zygopetalum stenochilum* Lodd. Bot. Cab. 1923. Lindl. Bot. Reg. XXX. (1844.) Misc. 15:

Foliis latioribus racemo aequalibus vel longioribus, sepalis oblongis acuminatis, petalis brevioribus duplo angustioribus, labello angusto oblongo obtuso villosio, callo emarginato.

Brazil.

Sepals blotched and somewhat striped with brown. The lip is white, with blue or violet veins in the middle only. Its small petals and very narrow lip readily indicate it.

Obs. Haec planta teste cl. Bateman in Gardeners Chronicle 1862. Nr. 51. p. 1196. bene ad *Zygopetalum crinitum* relata: I carried off a piece of this *Zygopetalum*; it was the identical piece, that bore the flowerspike from which Mr. Loddiges' drawing was made; but though it bloomed frequently in my stove, its flowers were invariably those of a common form of *Zygopetalum crinitum*; that is, they discarded the narrow lip, that constituted the (supposed) specific distinction of *Z. stenopetalum*. No doubt it was casual freak, not suspected at the time, but such as we now continually meet with among Orchids.

Addantur :

27. ZYGOPETALUM PARDINUM Rehb. fil. Mss.:

aff. *Z. brachystalidi*: sepalis lateralibus obliquis, marginibus internis basi semicordatis, ceterum involutis, labello unguiculato flabellato rotundato, callo hippocrepico in basi ante unguem.

Flos siccus pallide stramineus. Sepala et tepala guttis multis violaceopurpureis guttata. Racemus elongatus laxiflorus. Bractee dimidiam ovarii pedicellati longae. Andes: Western declivity, Jamieson!

28. ZYGOPETALUM COLORATUM Lind. et Rehb. fil. Mss.:

aff. praecedenti: tepalis oblongis apiculatis, sepalis lateralibus obliquis curvatis, labello pandurato apiculato, crista baseos multidentata.

Sepala et tepala extus pallide rufina; intus kermesina maculis luteis. Labellum album seu flavum. Racemus multiflorus. Bractee lanceae dimidiam tertiamve ovarii pedicellati aequantes. — E Nova Granata iconem misit Schlim.

Juxta Sect. Kefersteiniae:

29. ZYGOPETALUM FLAVEOLUM Lind. et Rehb. fil. Mss.:

Sepalis lanceis, tepalis oblongis acutis undulatis, labello oblongo bilobo lobulato crispulo ciliato, callo transverse semilunato in basi, in medio anteposito callo minore.

Flos illo Zygopetali graminei duplo major; sordide luteo cupratus. Callus et basis labelli et columna aurantiaci, maculis parvis kermesinis. Ocanna. Iconem misit Schlim.

1443 b. **ERIOPSIS** Lindl.

Bot. Reg. 1847. t. 9. adn. et tab. 18. Walp. Ann. I. 782. III. 543.

1. ERIOPSIS BILOBA Lindl. l. c. cf. Walp. Ann. III. 543.

Huc: *Pseuderiopsis* Rehb. fil.

Obs. Planta bene ludens labello. [Nunc plures flores vidi plantae Schomburgkianae ac intelligo, eam esse meram *E. biloba*. Ipse ill. Lindley in herbario asservat iconem floris anomali, tantum bilamellati.

Huc: *Eriopsis Schomburgkii* Rehb. fil. Bonpl. III. 67:

aff. *E. bilobae* perigonio (ex sicco) valde membranaceo tenui abbreviato, labello ovato basi subcordato apice in apiculum retusum contracto, lacinulis triangulis sex collateralibus in basi, gynostemio apice utrinque minute angulato. *Pseuderiopsis Schomburgkii* Rehb. fil. Walp. Ann. III. 543.

2. ERIOPSIS RUTIDOBULBON Hook. B. Mag. 4437. Diagn. cf. Walp. Ann. III. 543.

Rehb. fil. Bonpl. II. 281: Ocanna. Savannen und Wälder. Juni 4—6000'. N. 46. — Rehb. fil. Bonpl. III. 67: Teoramas 6000', März. Auf der Erde. Wagener. — Pescatorea t. 20. (sub *E. biloba*).

Obs. Falsissime Gardn. Chronicle 1849. 216: „The *Eriopsis rutidobulbon* of Bot. Mag. is nothing whatever except *E. biloba* well grown.“

3. ERIOPSIS SCEPTRUM Rehb. fil. Warscew. Bonpl. II. 98:

Labelli disco utrinque una lamella triangula prostrata aucto, ceterum laevi.

Perigonium patulum, phylla 5 oblonga apice obtusa seu obtuse apiculata, labellum ima basi unguiculatum, trifidum ad medium usque, laciniae laterales semireniformes, sinu acutangulo inter illas et unguem laciniae mediae, lacinia media lato unguiculata apice obtuse triangulo dilatata, antice retusa, nunc bilobula, basis labelli punctato subvelutina, discus inter lacinias laterales utrinque unilamellatus, lamella utraque ligulata obtusa extrorse antrorsa apice obtusa, basi tantum cum labello connata, unguis labelli praeter nervos elevatulos ac puncta laevis; gynostemium incurvum apice

utrinque angulatum. — Blütenstiel ellenlang, vielblüthig. Blüten so gross etwa, wie die der in Bot. Reg. abgebildeten *E. biloba* Lindl., nach Farbenskizze gelb, roth gerandet, Lippenvorderstück weiss, Hinterstück gelb, beide blau punkirt. Peru. v. Warscewicz.

4. ERIOPSIS SPRUCEI Rehb. fl. Mss. :

aff. *E. Sceptro*: tepalis angusto ligulato falcatis, labelli lobis posticis semiovatis, lobo antico cuneato rotundo sessili (nec ungue elongato fulto, ut in illa), carinis triangulis geminis medium versus (nec in basi, uti in *E. Sceptro*).

Rete nervorum valde insigne. Nam inter nervos lobelli externos nervuli transversi quasi rete efficiunt. Tales nervuli transversi in Eriopside *sceptro* desiderantur.

Rio Negro. Spruce 2390!

1443 e. **CHONDRORRHYNCHA** Lindl.

Orch. Linden p. 12. (1846.)

Epiphyta ebulbis. Scapus radicalis explanatus uniflorus. Flos explanatus, speciosus. Sepalum dorsale carinatum, dorso columnae insertum, lateralia basi oblique recurva. Petala membranacea, basi oblique inserta, sepalum dorsale et lateralia connectens. Labellum maximum, cucullus indivisus cum pede haud producto columnae articulatus. Columna elongata, semiteres; rostellum lineare, cartilagineum, elongatum. Pollinia 4, cereacea, inaequalia, concava, plana, glandulae longae acuminatae molli annexa.

1. CHONDRORRHYNCHA ROSEA Lindl. l. c.:

Folia spithamaea, papyracea, obovata, acuta. Flos candidus, roseo suffusus, 2½'' latus. Sepalum dorsale brevius; lateralia lanceolata, sesquipollicaria. Petala obovata, plana, obtusa, sepalis aequalia. Labellum obovatum, venosum, margine crispum. „A bulbless epiphyte from the deep and damp forests of Merida. Flowers rosy white. Jaji at the height of 5000'. Juli 1842.“ (Nr. 651.) This genus seems to be allied to *Helcia* and *Trichopilia*; but the extremely oblique insertion of the sepals is a most remarkable feature, as is the long cartilaginous bristlelike rostell, which is covered by a broad soft acuminate gland.

Rehb. fl. Bonpl. II. 280: Diese Pflanze hat uns schon früher Herr Linden wiederholt bestimmt so bezeichnet. Wir erinnern jedoch, dass dieselbe durchaus ein sehr deutliches Kinn besitzt, welches freilich leicht übersehen werden kann, da die Rückenwand der äussern Sepala mit einer Fuge an dem äusseren Fruchtknoten anliegt. Alle übrigen Verhältnisse passen genau; nur sitzen die höchst ungleichen Pollinia auf einer rundlichen Caudicula, der eine runde sehr spitze Glandula anhaftet. — Die Verwandtschaft mit *Trichopilia* wird natürlich durch obiges Verhältniss gestört. — Ocaña. Juli. 6000'. Nr. 34. Schlim.

2. CHONDRORRHYNCHA? Rehb. fl. Bonpl. III. 67: Es liegt eine hübsche Art vor, welche ohne allen Zweifel neben die Pflanze Schlim Nr. 34 gehört. Die Blüthe ist sehr zart und hat die Grösse derer der Warscewiczella *discolor*. Sie war nach unseres Freundes Wagener Angabe violett und zeichnet sich namentlich durch die stark gezähnelte und krause Lippe aus. *Aspasica*. Santa Marta. — Unsre Zweifel gegen die Identität mit *Chondrorrhyncha*, die Herr Linden behauptet, oder, falls diese begründet, gegen die Richtigkeit der Diagnose von *Chondrorrhyncha* haben wir bereits angegeben. Wir können demnach jetzt die Pflanze nicht sicher bestimmen. Hier fügen wir die nach Schlim. 34 entworfene Beschreibung bei. Gen. aff. *Lycasti* pollinis quaternis sessilibus in caudicula brevi rotundata cum glandula magna molli. Planta ebulbosa. Perigonii sepalum supremum oblongum basi cuneatum, apice

acutiusculum, in sicca planta nervosum, carinatum; sepala lateralia subaequalia, sed deorsum incurva, subfalcata, cum tepalis vix imbricantia, ima basi infera obtusangula libera, tantum basi superiori cum pede gynostemii cohaerentia. Tepala oblonga, basi subcuneata, apicem versus dilatata, imo apice retusa crispula, basi valde obliqua cum sepalis vix imbricantia, illis latiora. Labellum in pede gynostemii Zygotepali more, a cunesta basi flabellatum, dilatatum, marginibus anterioribus crispulum, microscopicè denticulatum, apice retuso subtrilobum, collo antrorso libero laminae-formi apice tridentato in medio disco. Gynostemium semiteres, margine anteriori superne marginatum, infra antice omnino planum, nec concavum. Androclinium obliquum marginatum. Rostellum tridentatum dente medio corneo, lineari longe producto; dentibus lateralibus membranaceis supra foveam reniformem flexis. Anthera oblonga, plana, postice emarginata, semibilocularis. Pollinia inaequalia, concava, oblique pyriformia, depressa in caudicula obtuse pentagona, cui glandula infra adhaeret mollis.

1443. **WARREA** Lindl.

Bot. Reg. XXIX. (1843). p. 14.

Flores subglobosi, subregulares, mento brevi rotundato. Labellum continuum, indivisum, lineis elevatis carnosis in medium. Columna semiteres, clavata. Pollinia 4, per paria in caudiculam brevem linearem inserta, glandula triangulari.

Herba terrestris, pseudobulbosa. Folia arundinacea. Scapus radicalis elatus apice racemosus. Flores magni speciosi.

1. WARREA TRICOLOR Lindl. Bot. Reg. XXIX. (1843.) p. 44. — *Maxillaria Warreana* Lodd. Bot. Cab. 1884. L. O. 148. — Bot. Reg. XXXI. 1845. sub 28:

Scapo multifloro, foliis longiore, sepalis ovatis basi subaequalibus, petalis minoribus conformibus, labello brevissime unguiculato obovato-oblongo indiviso cucullato obtuso jugis tribus in medio elevatis carnosis, superficie laminae seriatim corrugata marginibus planis.

Brazil.

Sepals yellowish brown, lip yellow at base, pallid at the end, rich purple in the middle.

Lindl. Bot. Reg. XXIX. l. c.: Folia oblongo-lanceolata acuminata plicata, scapo radicali erecto vaginato multifloro, foliis longiore. Sepala ovata concava acuta basi subaequalia, petalis minoribus conformia, labello brevissime unguiculato obovato-oblongo indiviso cucullato obtuso, jugis in medio elevatis carnosis, superficie laminae seriatim corrugata marginibus planis. Sepala fulvo lutea lateralibus basi parum inaequalibus. Labellum basi luteum, apice pallidum, medio purpureum, cum columna subarticulatum.

Maxillaria Warreana Lindl. Hook. B. M. 4235:

Pseudobulbis oblongis attenuatis articulatis, foliis subito lanceolatis basi longe attenuatis nervosis plicatis, scapo radicali erecto elongato vaginato multifloro, floribus subglobosis, sepalis petalisque subaequalibus rotundato-ovatis concavis acutis, labello obovato basi cucullato intus medio jugis tribus elevatis carnosis, apice dilatato sublobato supra plurilamellato, columna inclusa.

S. Martha. New-Granada. Purdie.

Huc: *Warrea bidentata* Lindl. Bot. Reg. XXX. (1844). Misc. 78:

Bracteis pedicello quadruplo brevioribus, labelli apice bidentati venis valde convexis flabellatis altis intermedia duplo majore.

At first sight we took this for *Warrea tricolor*. Its lip is however regularly slit at the end, the veins are much more convex, and the central plates thinner and deeper, than in that species. The bracts too are not half the length. Caracas: sent to Rucker.

Lindl. Orchid. Lind. 1846. p. 18: „On the ground in the thick forests of the foot of the peak of Tolima, at the height of 4000'. Stem erect 2-3' high. Petals white and pink. Lip spotted with purple. Febr. 1843.“ N. 1283. — Lindl. in Paxt. Fl. G. I. p. 73. 108. Misc. Xyl. 47: *W. Lindeniana* Henfrey in Gardn. Mag. Bot. 177: New Granada. Habit of *W. tricolor*; flowers pale cream colour, with a purple lip; fig. 47. lip. magnif. Not a native of Peru, but found by Mr. Lind. pp. of Orch. Lind. — It is said to have some pink in the flower when wild; habit of *W. tricolor*.

Warrea tricolor Lindl. Rehb. fl. Xenia I. Tab. 24. I. II. 1 — 9. p. 63: Caulis tumidus bene foliosus post folia oblongo lanceolata acuta basi cuneata plicata dejecta cylindraceo pseudobulbosus. Pedunculus axillaris in vagina, validus, basi parce squamatus, superne dense racemosus. Bracteae ovatae acutae abbreviatae. Flores carnosissimi magni speciosi sensim floridi nec coaetanei, clausi seu semiclausi. Ovaria cylindracea pro flore sat gracilia ascendentia apice curvata torta. Mentum magnum. Sepalum summum oblongo lanceolatum, subgaleatum, acutum. Sepala lateralia altiora per nervum medium obtuse carinata. Tepala cuneato oblonga acuta. Labellum circuitu rhombeo ovatum, subcucullatum, antice sinibus insilientibus plus minus trilobum, lobus medius productus sinuato bilobulus, superne rugoso verruculosus, carina magna dorso anceps, lateribus bisulcata, antice trilobula a basi brevissime unguiculata cordata per discum. Gynostemium semiteres, superne curvatulum, basi carina prominente signatum. Androclinii limbus prominulus obscure transiens in alas descendentes supra basin utrinque obtusangulas. Androclinium fornicatum figurae semilunaris; lobi laterales descendentes pone margines laterales foveae stigmaticae, lobus medius: dens lineari subulatus. Fovea triangula, basi labio prominulo signata. Anthera depressa obtuse triangula pariete posteriori subpersistente bivalvis. Pollinia obtusangula obtriangula, per paria incumbentia posticis brevioribus in caudicula obtuse rhombea superne peltatim affixa, quae inferne viscinosa. Flores prima anthesi albi, dein ochroleuci, demum intense flavi tepalis semper pallidioribus. Labellum omissis marginibus posticis albis purpureum, venis obscurioribus radiantibus. Gynostemium album, antice purpureo striolatum.

2. WARREA CYANEA Lindl. Bot. Reg. XXX. (1844). Misc. 3:

Spica brevi, bracteis ovarii longitudine, sepalis ovatis, petalis subconformibus, labello subrotundo-cuneato apiculato undulato lineis quinque elevatis.

The purest blue known in the vegetable kingdom colours the lip of this beautiful flower; which is otherwise white. It has quite the habit of *W. tricolor*, but is very much smaller in all its parts. Its most dist. character is found in the form of its lip, which has a distinct point, and 5 ribs, not 3, near the base. Messrs. Loddiges imported it from Columbia. — B. Reg. XXXI. (1845). Tab. 28.

1443. ZYGOSEPALUM Rehb. fl.

in De Vriese Kruidskdige Archief 1857.

Rehb. fl. in v. Schl. Bot. Ztg. 1852. 668. Zygopetali Sectio (an Genus?): Zygosepalon. Androclinium cucullatum. Anthera longe apiculata. Rostelli trilobi lobi aequales. Caudicula cum glandula stigmatis foveam tegens.

Obs. Glandula pulchre emarginata genus a Batemanian bene eximit.

1. ZYGOSEPALUM ROSTRATUM Rehb. fil. l. c. apud De Vriese. Huc: *Zygopetalum rostratum* Hook. Bot. Mag. 2819. L.O. 188. Rehb. fil. apud v. Schl. B. Z. 1852. 668:

Perigonii phyllis subaequalibus lanceolatis acuto-acuminatis; labelli lamina oblongata, obtusata, nunc acuta, imo trilobula, callo hippocrepico multicrenulato.

Die Trugknollen viel breiter. Blüten doppelt so gross. Die Hüllblätter grün, mit Braun angehaucht. Die Leiste auf der Lippe vielkerbig, bald rosa, bald blau. Hierher Gardner's Exemplare. — Herr Kegel sammelte bei Mariepaston (also 40 Meilen weiter im Innern des Landes) die alte Art, das *Zygopetalon rostratum* Hook., wie ich aus einem meisterhaften Originalbilde des Hrn. Strooband sehe.

2. ZYGOSEPALUM KEGELII Rehb. fil. l. c. apud De Vriese. Huc: *Zygopetalum Kegelii* Rehb. fil. apud v. Schl. B. Z. 1852. 668:

Perigonii phyllis subaequalibus lanceolatis acutis, labelli lamina transverse quadrata obtusangula medio antice apiculata, callo hippocrepico, paucicrenulato.

Trugknollen schmal, länglich. Die Hüllblätter blassgrün, braungefleckt; Lippe weiss mit violetten Strichelchen. Säule weiss. Blüten so gross, wie die des *Z. maxillare*. Vom Herrn Universitätsgärtner Kegel in Surinam bei Geiersvlyt und Tourtonne entdeckt, woher es bei Hrn. Van Houtte blühte.

1444. **CYRTOPODIUM** RBr.

Hort. Kew. ed. 2. V. 216.

1. CYRTOPODIUM CARDIOCHILUM Lindl. Journ. H. S. IV. 266. (1849):

Racemo multifloro, bracteis ovato oblongis membranaceis, unicoloribus, sepalis petalisque oblongis obtusiusculis his (immaculatis) basi angustatis, labelli sessilis cordati trilobi lobo intermedio cordato rotundato margine tenue subplicato lateralibus acinaciformibus erectis, crista pulvinata serie simplici verrucosa.

At the base of the lip is to be found a convex warty crest unknown in *C. Andersoni*, and at the end of the lip is no trace of the tubercles so conspicuous on the edges of *C. punctatum*. Hanbury. — Paxt. Mag. XVI. 369.

2. CYRTOPODIUM BLANCHETII Rehb. fil. in Linnaea XXII. 852. Cf. Walp. Ann. III. 552

3. CYRTOPODIUM PUNCTATUM Lindl. Orch. 188. Hook. Bot. Mag. 3507:

Bulbis elongatis, foliis linearilanceolatis tenuiter acuminatis, scapo paniculato, bracteis magnis membranaceis, sepalis petalisque undulatis acutis maculatis, labello stipitato profunde trilobo, lobis lateralibus obovato-cuneatis incurvis, intermedio late obcordato margine granuloso, disco basi calloso.

Helleborus ramosissimus cauliculis et floribus maculosis. Plum. Sp. p. 9. t. 187. Flores sulphurei rubro picti.

Lindl. Sert. 12: Bright, deep crimson stains with which bracts and flowers as well as flower stems are richly variegated. St. Domingo. Ch. Mackenzie. Mexico: basaltic rocks at Malpayo de Naulinge in tierra templada, flow. April. Schiede! Brazil. Gardner. — *Oncidium palmophilum* palmis aliisque arboribus parasiticum sylvae Catingas, prov. Bahiensis ad Rio de Contas 1965. Mart. Herb.

Scapo 2—3" round, branched above the middle, dotted with purple, with few membranous scales. Flowers about an inch apart, nearly 2" diam. Sepals and petals spreading, reflexed, former oblong lanceolate, undulate, acuminate, acute, greenish yellow, blotched with crimson, latter bright yellow, of nearly the same size and form, but less undulated and rather broader, with a few crimson spots near the base. The

lip $\frac{1}{2}$ " long, fleshy, shortly unguiculate with a bright deep, yellow ground colour, trilobed, lateral lobes obovate, rounded, rather wavy and deep crimson; middle lobe broader than long, emarginate, dull crimson and closely tuberculate at the margin, the disk is little spotted and banded with yellow, and covered with pale yellow granules, which are collected into a circle in the centre and are also a little dispersed over the unguis. Column is green.

Rehb. fil. Bonpl. II. 19: Caracas. Wagoner. Bonpl. III. 67. N.-Granada. Wagoner.

b. bracteatum Rehb. fil.

Huc: *Cyrtopodium bracteatum* Linden herbar. Lindl. O. Lind. p. 23:

Racemo simplici, bracteis magnis membranaceis, labelli disco pulvinato verrucoso lobis lateralibus oblongis undulatis versus basin tuberculatis, intermedio transverso truncato indiviso margine in papillas soluto.

Scorching Savannahs, near Merida at the height of 5000'. Jul. Flowers and bracts bright yellow spotted with red." (N. —). — Differs from *C. punctatum* in its simple raceme, and in the form and markings of the lip.

4. CYRTOPODIUM ANDERSONI RBr. l. c. Lindl. Bot. Reg. XXVII. (1841.) 8:

Bracteis oblongis patulis concavis, sepalis petalisque obovato-oblongis planis, labelli lobis rotundatis, lateralibus erectis, intermedio concavo basi sulcato apice crenulato, disco nudo.

Tylochilus flavus Nees in Verhandl. des Vereins zur Bef. des Gartenb. VIII. 191. t. 3.

Tropical parts of America, where from the fleshy stems the shoemakers obtain a kind of paste or glue, which they use for the purpose of their art. There are 2 var. in our coll., one, which is that now fig., has a branched inflorescence; the other has a perfectly simple one, with much larger flowers; the latter may possibly be the *C. glutiniferum*, a plant I am unacquainted with.

Hook. Lond. Journ. I. p. 188: On rocks, on wood, common on the mountains about Rio. Sept. Gardner 122.

Huc: *Cyrtopodium flavum* Mutel Mem. Orch. p. 141. (ego non vidi. Rehb. fil.) — Lond. Journ. 1843, 672: On the river Mijore. Schomburgk! — Bot. Reg. XXVII. (1841). Misc. 49: De flore educando. Planta gemmifera in alia terra ponatur remotis radicibus vetustis.

5. CYRTOPODIUM CRISTATUM Lindl. Bot. Reg. XXVII. (1841.) sub t. 8:

Racemo simplici, bracteis concavis patulis setaceo acuminatis, labelli lobis subaequalibus, lateralibus erectis, intermedio concavo integro disco nudo, crista oblonga carnosa, inter lobos laterales.

Lindl. in Hook. Lond. Journ. 1843. II. 672: On rocks and trees. British Guiana. Schomburgk 628.

6. CYRTOPODIUM PARVIFLORUM Lindl. sp. in. Hook. Lond. Journ. II. (1843). p. 672.

Sepalis petalisque undulatis, labelli lobis lateralibus falcatis obtusis, intermedio cuneato dilatato, basi tuberculato aequalibus.

Flores *C. cristato* similes, sed duplo minores. Et labello omnino diversum. — On sand, British Guiana, Schomburgk N. 617.

1446. **CYRTOPERA** Lindl.

L. O. 189.

1. CYRTOPERA FLAYA Lindl. O. 189. Huc: *Cyrtopera Cullenii* R. Wight Ic. V. 1754:

Leaves oblong, lanceolate, plaited, scape slender, angular, somewhat drooping towards the apex; flowers numerous, loosely racemose, long

pedicelled, bracts ovate, subulate, sepals obovate lanceolate, narrower, than the obovate very obtuse petals, lip three-lobed, middle one somewhat smaller, threecrested. Travancore.

Flowers yellow and the scape appear before the leaves, but the appearance of the plant so far as I can learn from comparison with Dr. Royle's figure is different from *C. flava*. Some leaves 2' in length. I am indebted to General Cullen, resident of Travancore for my specimen of this gorgeous plants.

2. *CYRTOPERA FUSCA* R. Wight Ic. V. 1690:

Leaves long lanceolate, plicate, scape straight manyflowered, sepals linear lanceolate, acute, longer than the broader ovate lanceolate petals, lip obsoletely three-lobed, lateral lobes short roundish, middle one oblong, undulate, pointed, the disk covered with minute papillae, base of the column prolonged, obtuse, forming with the lip a large inflated spur. Sepals dull reddish brown or lilac, ascending petals and lip much paler.

Rocky clefts in rich vegetable soil by the Kartairy falls near Kaitie. Neilgherries. Rhizome very large, somewhat ovate and flattened; the scapes and flowers appear first and are succeeded by the leaves, scapes 12—18 inches high, and in large specimens exceeding to 2 feet. May. June. Also rare in rocky clefts on the top of the high hill east of Coonoor.

3. *CYRTOPERA SQUALIDA* Rehb. Bonpl. 1857. p. 38. Huc: *Eulophia squalida* Lindl. Bot. Reg. XXVII. (1841.) Misc. 164:

Foliis lato-ensiformibus 5-nerviis, spica multiflora, floribus inferioribus remotioribus, bracteis ovatis acuminatis ovario acutangulo brevioribus, labello oblongo trilobo laciniis rotundatis intermedia crispa emarginata calva venis pluribus parallelis elevatis, calcare brevi, anthera obsoleta emarginata.

Cuming. Lodd. Leaves like these of a *Bletia* and a stout erect scape 1½' high with dingy pallid flowers, the lowermost of which are very remote from the uppermost. The lip has no appendages, but is strongly marked by elevated veins and it is entirely confluent with the column at the base.

4. *CYRTOPERA LONGIFOLIA* Rehb. fl. C. Woodfordi Lindl. — Orch. Lind. p. 10; damp forests of the Sierra Nevada, where it chiefly occurs on the outskirts. Rhizome bulbous creeping. Stem a yard high. Sepals yellowish green. Lip purple. Merida 5000'. Aug. N. 662. — Rehb. fl. Bonpl. II. 19: *Dendrobium longifolium* Humb. Kth. *Govenia barbata* Endl. Pöpp. — anno 1838. Savannenpflanze. Caracas. Wagerer.

Var. ? *pachystelidia* Rehb. fl. in v. Schl. B. Z. 1852. p. 734: *Validissima*; gynostemio breviori, latiori, lamellis in lobo medio haud linearibus, sed latioribus, saepe bifurcatis. — [Ohne die bei den *Cyrtopera* wichtige Anthere. — Chiriqui. St. Peter. v. Warszewicz.

5. *CYRTOPERA FOLIOSA* Lindl. Hook. Comp. B. Mag. II. 203:

Vaginis scapi foliosis, foliis strictis ensiformibus, racemo multifloro, vagina suprema paulo longiore, (bracteis acuminatissimis laceris floribus longioribus), perianthii carnosii laciniis lanceolatis acutis subaequalibus, labello concavo subrotundo trilobo, lobo intermedio emarginato medio parce papilloso basi tricristato.

Inter Basche et Omtala in graminosis. Drege.

Caulis sesquipedalis fere ad racemum usque vaginis foliosis instructus; lamina vaginarum ensata. Folia scapi longitudine, stricta, ensiformia, plana, striata, costis tribus conspicuis in sicco 4 lineas (verosimiliter semiunciam) latis. Racemus 2½

poll. Bractee fissae et quasi ramentosae; an casu? Flores valde carnosii, subglobosi. Sepala lateraliter basi producta, ob pedem columnae, qui brevior est, quam in pluribus aliis speciebus. Labellum quodammodo obovatum, concavum, carnosissimum, tuberculis 3 oblongis contiguis ad basin cristarum ultra tubercula parce papillosum.

I have only seen a single specimen of this remarkable plant, which appears to have been only once found by Mr. Drège. It will stand next *C. plantaginea*.

- 6? CYRTOPERA PEDICELLATA Lindl. Orch. 190. — Lindl. in Bot. Mag. Comp. II. p. 204: It is very singular, that *Cyrtopera pedicellata*, the *Satyrium capense* of Linnaeus, which Thunberg says grows near Zeekorivier and elsewhere, has not yet been found in any of the rich collections of Messrs. . . . nor in the old herbaria of Vahl and Hornemann. The specimen in the Linnaean Herbarium, without leaves, shows that I was right in considering it a *Cyrtopera*. It is very distinct from any thing else, and is perhaps the smallest of the genus. It is most like a small state of *Eulophia tristis*.

Obs. Planta hic linquatur. Non videtur esse illa, quam sub *Cymbidio pedicellato* descripsi.

1447. LISSOCHILUS *R. Br.*

In Lindl. Coll. Bot. 31.

1. LISSOCHILUS SPECIOSUS RBr. l. c. Lindl. Comp. Bot. Mag. II. p. 204: Mr. Burchell found *L. sp.* near Uitenhage 4262.

Obs. Nescio, numne huc pertineat *Satyrium giganteum* L.? — Non liquet. Cl. Lindl. Comp. B. M. II. 204. *Eulophiam* fuisse credit.

2. LISSOCHILUS STREPTOPETALUS Lindl. Bot. Reg. 1002: „In one of the flowers on our specimen, there is a remarkable monstrosity. One of the segments of the inner perianth is reflected and assumes the appearance of the outer perianth, and on each side of the perfect anther there is an abortive, but distinct appearance of 2 others, making the whole number of 5“. Graham. — Lindl. Bot. Mag. Comp. II. p. 204: Sepala et labellum paulo acutiora. Vischrievier, Zwartkopsrivier. Drege.

3. LISSOCHILUS ROSEUS Lindl. Bot. Reg. XXIX. (1843.) p. 25. Misc. 37. *Dendrobium roseum* Sw. in Pers. Syn. p. 323:

Foliis lato-lanceolatis erectis plicatis, scapo squamis lanceolatis acutis membranaceis distantibus vaginato, racemo dense oblongo, bracteis ovatis acuminatis ovario brevioribus, sepalis spathulatis acutis, concavis reflexis, petalis oblongis apiculatis, labelli trilobi lobis rotundatis, intermedio emarginato cum mucrone, disco lamellis tribus undulatis serrulatis, tuberculo parvo utrinque.

Terrestr. imported by Sigismund Barker Esq. from Sierra Leone. It has large plaited leaves and rich rose-coloured flowers in a close raceme at the end of a scape between 3 and 4' high. Although the other species of the genus have flowers in which yellow is the predominant colour, this has scarcely any trace except in the middle of the lip.

Bot. Reg. XXX. 1842. Tab. 12: Sepala violaceo brunnea, petala rosea, labellum roseo kermesinum, extus basi flavum, cristis flavis.

4. LISSOCHILUS PARVIFLORUS L. O. 191. Lindl. Bot. Reg. XXIV. 1838. Misc. 14: Flowered Decb. in the coll. of Lodd., who obt. it from Algoa Bay. Leaves plaited like those of a *Bletia* and varied in breadth from $\frac{1}{2}$ — $1\frac{1}{2}$ ". Sepals are a dull greenish purple; petals were much broader and of a rich brownish red, rather strongly veined. The labellum was yellow, with the lobes light purple. Not to be compared in point of beauty with *L. speciosus* and *streptopetalus*.

5. LISSOCHILUS PLATYPETALUS Lindl. Comp. B. M. II. 204:

Foliis ensiformibus canaliculatis recurvis scapo triplo brevioribus, vaginis scapi laxis cucullatis, scapo laxo multifloro, sepalis ovatis, acutis reflexis petalis subrotundis apiculatis planis triplo brevioribus, labello carnoso hastato leviter saccato, lobis lateralibus parvis triangularibus, intermedio oblongo tuberculis tribus crenatis seriebusque 5 papillarum in disco.

In collibus calcareis Kopje; Zuurebergen in saxosis. Drege.

Pedalis sesquipedalisque, Scapus laxe et distanter vaginatus. Racemus laxus, 10—12 florus. Labellum lineari-oblongum, margine membranaceum; cyatho parvo trituberculato circa faucem sacculi; discus apice tuberculis 3 oblongis carnosis crenatis inter quae et saccum adsunt papillae numerosae sub 5 seriatæ demum in unam connatae, quae sacculum attingit.

6. LISSOCHILUS AEQUALIS Lindl. Bot. Mag. Comp. II. p. 204:

Foliis ensiformibus acutis recurvis scapo multifloro brevioribus, sepalis petalisque subaequalibus ovato-oblongis, obtusis, labelli lobis lateralibus rotundatis, intermedio oblongo obtuso sulcato.

Zuurebergen in graminosis. Drege. Scapus $1\frac{1}{2}$ pedalis, foliis longior. Bractee acuminatae, ovarii longitudine. Racemus sub 8 florus.

7. LISSOCHILUS CALOPTERUS Rehb. fil. Bonpl. III. 218:

Valde aff. *L. specioso* R. Br. foliis linearibus angustissimis, racemi secundi floribus illius triplo minoribus, sepalis ovatis acutissimis quam tepala subtriplo brevioribus.

Folia ultrapedalia, quasi juncea, forsán subteretia? etenim adeo complicata, ut aegre tantum possit canalis reperiri medius — tum ubi subplana forsán tres quatuorve lineas lata. Pedunculus bipedalis. Vaginae lanceolatae acutae latae nervosae; altera in basi, altera sub medio; duo superiores linearilanceae. Racemus elongatus. Bractee linearilanceosubulatae ovaria pedicellata semiaequantes. Tepala ovata acutiuscula (nec elliptica!). Labelli calcar conicum abbreviatum; lobi laterales rotundati replicati, lobus medius ovalis obtuse acutus ascendens margine plicato undulatus. Lineae carnosulae contiguæ varicosae a medio disco in basin: laterales nervi nunc etiam incrassati. Gynostemium brevissimum truncatum. Ex Africae ora orientali. „Blüthen goldgelb. Fetter Marschboden. April 1846. Dr. Peters. (Mus. Berol.)”.

1448. **NOTYLIA** Lindl.

Bot. Beg. 930. — Rehb. fil. Xenia Orch: I. p. 46. sq.:
monographia, quam hic edimus additis diagnosisibus originalibus.

A. Folia equitantia ensata.

1. NOTYLIA BICOLOR Lindl. in Benth. Plant. Hartw. 1842. p. 93. Rehb. fil. I. c. 46:

Gynostemio medio angulato, labello libero breviter unguiculato ligulato ante apicem sagittato, apice setaceo ecarinato, longiore.

Folia acinaciformia, acutiuscula, ornithocephalina. Pedunculus tenuis capillaribus apice racemosus (—10 florus). Ovaria capillata pedicellata. Perigonium tenuissimum. Sepala lineari setacea, inferiora ima basi coalita, alba. Tepala paulo latiora, breviora, lazulino violacea. Labellum cf. supra, ejusdem coloris. Anthera maxima dimidium gynostemium excedens. — Plantula sesquipollicaris; sepala subsemipollicaria.

In montibus Comalapan in Quercubus. Hartweg!

Lindl. l. c.: *Notylia bicolor* Lindl. sp. n.:

Foliis brevibus equitantibus acutis, scapo erecto multifloro, racemo subrotundo, sepalis lateralibus fere liberis petalisque lineari-lanceolatis acuminatissimis, labello unguiculato sagittato acuminatissimo.

Species perpulchra, sepalis pallidis, labello petalisque violaceis. Folia, scapus spicaque simul juncta vix 2 uncias aequant, sepala tamen semipollicaria.

2. NOTYLIA WULLSCHLAEGELIANA Focke in v. Schl. Bot. Z. 1853. p. 343. R. fil. l. c. 46:

Gynostemio apice angulato, labello basi adnato carinaeformi utrinque angulato carinato, apice hastato erosulo gynostemio suo breviori.

Folia acinaciformia, longiora, apice nunc subfalcata. Pedunculus tenuis apice racemosus seu paniculatus. Bracteae lineari setaceae, brevissimae. Sepala lineari setacea; lateralibus labello supposita, parallela, albidoflaeola, tepala vix latiora, breviora, apice setacea falculata (semper?) alba, purpureo punctata. Labellum album supra descriptum. Gynostemium apice inflexum, incrassatum, pulvinari androclinii magno. Anthera purpureo punctulata, gynostemii tertiam aequans.

Para. Onoribo. Wullschlaegel!

Focke l. c.: Foliis cultriforribus equitantibus purpureo-reticulatis, scapo axillari corymboso paucifloro foliis longiore, sepalis lanceolatis acuminatis, lateralibus ima basi connatis approximatis, petalis linearibus, labello hastato aristato-acuminato unguiculato basi biaurito, floribus diaphanis. Radices crassiusculae, alidae. Folia cultriformia, subcarnosa, acuta, basi vaginantia, venis purpureis elevatis eleganter reticulata, 2 centim. longa, 5 mm. lata, in flabellis 3—4-foliatis congesta. Scapus axillaris, debilis, nutans, apice corymboso-racemosus, 6-florus, purpurascens, bracteatus, foliis longior, 4 centim. longus. Perianthium membranaceum, diaphanum, patulum. Sepala lanceolata, sensim aristato-atenuata, planiuscula, apice recurva, virescentia; supremum concavum; lateralibus ima basi connata, approximata, centimetri longitudine. Petala linearia, acuta, vix breviora, plana, incurva, apice recurva, albida, maculis 5—6 purpureis in una serie positis picta. Labellum patens, hastatum, marginibus subincurvis, aristato-acuminatum, unguiculatum, ungue insidens pedunculo incurvo, ibique tuberculo inter 2 aures laterales rotundatas deflexas purpureas praedito, petalis concolor, 2—3 maculis purpureis in disco et ungue pictum. Columna gracilis, elongata, stricta, teres, purpurascens. Stigma verticale. Anthera dorsalis, unilocularis, oblonga, incurva, compressa, purpurea, cum stigmatem parallela. Clinandrium resupinatum, postice marginatum, falcatum. Pollinia 2 libera, ovata, compressa, erecta in caudicula lineari-elongata, apice quadrato-dilatata. Glandula ovalis. Ovarium breve, sulcatum, purpurascens. Pedunculus floris longitudine. Herba nana epiphyta. Habitat in districtu Para Surinamensi. Florebat Novembri. Flores inodori pro statura plantae satis magni.

B. Folia plana.

a a. Labellum basi carinatum seu callosum.

1) Gynostemium velutinum.

3. NOTYLIA PUBESCENS Lindl. Bot. Reg. XXVIII. 1842. Misc. 72. Rehb. fil. l. c. 47:

„Foliis oblongis subundulatis subconcavis, racemo folio longiore pendulo, labello rhomboideo basi carinato et columna pubescentibus, sepalis lateralibus basi tantum connatis.“

„Flores aurantiaci, odorati. Brasilia.“ Loddiges. — Sepala libera? Gynostemium rectum?? Specimen cultum huc videtur referendum excellens pedunculo subpedali gracili multifloro. Flores tenelli, haud parvi, aurantiaci. Sepala lateralibus bifida, apicibus reflexis. Labelli unguis carinatus; lamina angusto rhombea quadruplo brevior. Linea laminae media velutina. Gynostemium labello prope duplo brevius, apice paulo curvulum, velutinum. Ex horto Schilleriano.

2) Gynostemium glabrum.

— Omnes species huc retuli, quarum gynostemia „pubescentia“ non expresso commemoravit ill. auctor. An vere huc pertineant, nescio, cum nihil certi de indumento dixerit. —

4. NOTYLIA PUNCTATA Lindl. Gen. Sp. Orch. 192. (an etiam Bot. Reg. 930?)
Rchb. fl. l. c. 47:

„Labello unguiculato cordato ovato obtuso basi calloso margine reflexo, sepalis petalisque obtusis, rhachi flexuosa.“

Lindl. Bot. Reg. XXIV. 1838. Misc. 166. *Pleurothallis punctata* Ker. (Gawler) Bot. Reg. IX. 759. 1838. *Gomeza tenuiflora* Lodd. fid. Lindl. Candida. — „Ex insula Trinitatis“ (si fabula vera, cum species multae caracasanae in hortos Trinitatis insulae advectae in Angliam missae pro trinitensibus habitae fuerint). — De gynostemio ill. auctor tacet.

Specimina culta, quae huc pertinere arbitror ita definienda: pedunculo brevi crasso plus minus densifloro, sepalo summo lanceo obtuse acuto, inferiori oblongo lanceo apice fisso bis acuto, tepalis sepalo impari aequalibus subbrevioribus, labelli ungue lamina anguste triangula triplo breviori, per unguem in laminam carinato, gynostemio aequilongo, apice inflexo.

Huc Lindl. Bot. Reg. XXIV. 1838. Misc. 166:

Labello unguiculato cordato ovato obtuso basi calloso, margine reflexo, sepalis petalisque obtusis, rhachi flexuosa.

I believe, the original species is lost, and its place has been taken by other species resembling it enough to be mistaken for it. At least, I must confess, that I had regarded specimens sent me from time to time by Mr. Bateman, Mr. Barker, Messrs. Loddiges and others as mere varieties of *Notylia punctata*. I am however now satisfied from the examination of specimens from Loddiges, that the supposed varieties constitute at least 5 well marked species etc. The true *Notylia punctata* has whiter flowers, than any of the others, with a short flexuose raceme and obtuse sepals, petals and labellum, at the base of the latter of which is an elevated callus.

5. NOTYLIA MICRANTHA Lindl. Bot. Reg. XXIV. Misc. 170. 1838. Rchb. fl. l. c. 47:

„Labello subsessili plano ovato acuto basi calloso, sepalis petalisque linearibus acutiusculis, columna recta.“

„Flores dimidium aequant specierum parviflorarum, pallide virides labello flavido. Tepala immaculata.“ „Demerara Loddiges.“ — Sepala liberrima? Gynostemium vere glaberrimum?

6. NOTYLIA BARKERI Lindl. Bot. Reg. XXIV. 1838. Misc. 168. Rchb. fl. l. c. 47:

„Labello unguiculato cordato ovato basi calloso margine subreflexo; sepalis lateralibus apice reflexis petalisque lineari lanceolatis acutis, columna recurva.“

Similis *Notyliae incurvae*, sed flores minores, magis flavi, labellum non acutum, distincte callosum. Mexico, Barker 1837. (Specimen: Mexico Xalapa Leibold huc si recte refero: h. sp. s.)

7. NOTYLIA BIPARTITA Rchb. fl. Mss. 1842. l. c. 47:

Racemo pendulo multifloro, bracteis lineari setaceis ovariis pedicellatis triplo brevioribus, sepalis tepalisque lineari lanceolatis apice acuminatis, apicibus sepalorum inferiorum basin prope usque infimam liberorum revolutis, labelli ungue laminae anguste trullaeformis basi rotundatae tertium vix aequante, carina per unguem basinque laminae gynostemio imo tantum apice incurvo laevi labelli dimidium subaequante.

b b. Labellum basi ecallosum ecarinatumque.

— Haec in sectione ill. auctor de gynostemio velutino („pubescente“) seu laevijsermonem non facit, quare dubia jam in priori sectione magna hic „prope intolerabilia exorta. —

1) Sepala lateralia omnino coalita.

8. NOTYLIA HUEGELII Fenzl Denkschr. d. k. k. östr. Akad. Math. Natw. Classe I. 255. Cf., Walp. Ann. III. 553.

Huc: *Notylia Tridachne* Lindl. l. c.:

Sepalis lateralibus omnino connatis, labello trullaeformi acuminato basi angustato ecalloso.

Hort. Soc. Garden. Remarkable for the combination of sepals into two, instead of three. Petals are yellow, with one or two orange spots; lip clear yellow. It is probable that *Notylia Huegelii* is the same.

2) Sepala lateralia bifida.

9. NOTYLIA SAGITTIFERA Hook. B. J. III. 315. Lk. Kl. O. Abb. 18. 1840. R. f. l. c.:

Racemo laxo, sepali inferioris apicibus revolutis, tepalis cuneato oblongis, labelli ungue laminam subaequante (4:5), lamina basi cuneato rotundata antice utrinque retusa in apicem setaceum extensa, marginibus revoluta.

(Gynostemio velutino, apice tantum inflexo, nunc plus, nunc minus.) *Pleurothallis sagittifera* Hb. B. Kth. Voy. I. t. 91. *Notylia multiflora* Lindl. Bot. Reg. 930. *Notylia tenuis* Lindl. Bot. Reg. XXIV. 1838. 169. Folia oblongo lanceolata acuta basi cuneata. Inflorescentia in icone Humboldtiana forsitan nimis densa. Nec icon citata Schmidiana accurata videtur. Demerara fide Lindl. Caracas Wagener! Regn. Novo Granat. Humboldt Bpl. I (Hab. sp. sicc.)

Huc: *Notylia tenuis* Lindl. Bot. Reg. (1838). XXIV. Misc. 169:

Labello unguiculato e cordato-ovato setaceo-acuminato basi ecalloso margine reflexo, sepalo supremo falcato inflexo, lateralibus apice revolutis petalisque linearibus acuminatis, columna recta.

This species is readily known by its very narrow acuminate sepals and petals, erect column and acuminate lip, which is not carinate at the point. Its flowers are smaller, than those of *N. incurva*. Nat. of Demerara. Mr. Loddiges.

10. NOTYLIA AROMATICA Barker Bot. Reg. XXVII. (1841.) Misc. 77. Rehb. fl. l. c.:

„Labello unguiculato ovato rhomboideo acuminato basi utrinque deflexo ecalloso, sepalis apice revolutis, inferiore bilobo, petalis linearibus rectis acutis.“

„Parva inconspicua. Flores odoratissimi, aquoso virides. Maculae flavae geminae in basi utriusque tepali.“ Valde affinis *N. Barkeri*, a qua distat. labelli forma et callo. Para. Huc retulerim specimina: Paramaribo 1644. Kappler! Surinam Weigelt! (forsan ibidem lecta) (gynostemio omnino laevi). (Hab. sp. sicc.)

Obs. Num huc *Notylia laxiflora* Westcott Phylol. I. 54? Cf. Lindl. Paxt. III. 46.

- 11? (10?). NOTYLIA FRAGRANS Wulfschl. in v. Schl. Bot. Z. 1852. 342:

Foliis conduplicato vaginantibus distichis, oblongis, acutis, racemo axillari densifloro pendulo, foliis longiore, sepalis acutis, supremo concavo, arcuato, lateralibus a medio liberis revolutis, petalis linearibus incurvis, labello hastato acuminato unguiculato. Radices filiformes, albidae. Pseudobulbillus monophyllus, folii plicati oblongi, acuti basin efformans, compressus striatus, foliorum lateralium basi inclusus, vix 2 centim. longus. Folia lateralia basi conduplicata vaginantia, disticha, subundulata, 1—2,5 decim. longa. Scapus racemosus, axillaris, pendulus, densiflorus, bracteatus, foliis longior, teres, aliquando basi di-trichotomus. Bractee caulinae adpressae amplexicautes; florales minutae, subulatae, patentissimae, persistentes. Perianthium patulum. Sepala lanceolata, concava, viridi-lutea; lateralia connata, a medio libera et revoluta, labello supposita; supremum arcuatum, acutissimum, apice recurvum. Petala linearia, acutissima, plana, incurva, albidia, duabus maculis vitellinis picta. La-

bellum hastatum, explanatum, acuminatum, unguiculatum, ungue verticaliter compresso valido, ad insertionem tumidum, apice prono, nitidum, album. Columna cum ovario continua, crassa, teres, erecta, labello brevior, viridis; clinandrio postice marginato, falcato. Anthera dorsalis, unilocularis, lineari-oblonga, incurva, cum stigmatibus verticali parallela, viridis. Pollinia duo libera, ovata, compressa, in caudicula elongatae apice cuneato-dilatatae erecta. Glandula minuta, orbiculato-peltata. Ovarium sulcatum. Capsula oblongo-ovata, brevi-rostrata, obsolete trigona. Herba epiphyta non rara in ramis Crescentiae Cujete et passim. Floret per totum fere annum. Flores reflexi, breve pedunculati, odorem Caryophylli aromatici spirantes.

12. NOTYLIA INCURVA Lindl. Bot. Reg. XXIV. 1838. Misc. 167. Rchb. fil. l. c.:

„Labello unguiculato cordato ovato acuminato sub apice carinato basi ecalloso margine reflexo, sepalis lateralibus apice rectis petalisque lanceolatis acutis, columna recurva.“

Flores maximi dicuntur, pallide straminei; maculis 2—3 luteis in basi tepalorum. Sepali inferioris laciniae lanceolatae acutae, nec acuminatae. Gynostemium abrupte incurvum. Insula Trinitatis. Loddiges importavit.

13. NOTYLIA MULTIFLORA Hook. Lond. Journ. III. 1844. 315. tab. 10. Rchb. fil. l. c.:

Racemo densissimo cylindraco, labello plano deltoideo trulliformi calloso ungue lamina apice attenuata multo brevior, sepalis inferioris apicibus reflexis, gynostemio recto labello brevior.

Mexico? — Haec ad iconem. Analyses valde inaccuratae. Relatio longitudinis gynostemii labellique in quavis figurarum 1. 2. 3. diversissima. Tamen haec longitudinis relativae momenta in hoc genere constantissima, maximi facienda. — Folia oblonga acuta.:

Huc: *Notylia multiflora* Hook. (nec Lindl.) l. c.:

Racemo pendulo multifloro, labello trulliformi ecalloso, sepalis petalisque acutis (Tab. X). Hab. Mexico?

Plantae epiphytae, caespitosae. Caulis subnullus, squamis laxis membranaceis tectus. Folium solitarium, oblongum, subcoriaceum, acutiusculum, venis obsolete. Pedunculus radicalis, simplex, racemus pendulus. Racemus 4—5 uncias longus multiflorus. Flores parvi, albi, sparsim flavo-maculati, basi minute bracteati. Sepala lato-lanceolata, patentia, acuta. 2 lateralia fere ad medium connata. Petala sepalis conformia, patentia. Labellum trulliforme, seu deltoideo acuminatum, planum, ecallosum, basi breviter unguiculatum. Columna teres. Anthera ovata, obtuse subacuminata, dorsalis, unilocularis. Pollinia 2, ovata, seu potius obovata, caudicula elongata, glandula minuta.

It was quite by inadvertence, that the specific name of multiflora was given to this plant by me and written upon the plate, for there is a *Notylia multiflora* of Dr. Lindley in Bot. Reg. sub tab. 930, and kept up in the G. et Sp. O. As however that plant is avowedly the *Pleurothallis sagittifera* of Humboldt, and as our species bears more numerous flowers, the prior name of sagittifera had better, perhaps, be restored to Dr. Lindley's *N. multiflora*.

14. NOTYLIA ALBIDA Klotzsch in Otto u. Dietrich Allg. Gtzg. 1851. p. 281. R. fil. l. c.:

Sepalo superiori ovato acutiusculo, inferiori subaequali bidentato, labello brevissime unguiculato oblongo acuto medio utrinque angulato antrorsum attenuato, basi utrinque ante unguem rotundato; gynostemio apice ascendenti recurvo glabro, labelli dimidium aequante.

Ex America centrali (Vid. s. s.)

Huc: *Notylia albida* Klotzsch l. c.:

Pseudobulbis caespitosis, minimis, compressis, leviter 10 costatis, unifoliatis, vagina squamaeformi, acuta, duplicata, subarida involucratiss, foliis terminalibus car-

noso coriaceis; oblongis laete viridibus, dorso carinatis, inferne attenuato-con-duplicatis, versus apicem planiusculis, apice rotundatis, inaequaliter apiculatis; scapo pendulo, multifloro, floribus albidis, nutantibus; bracteis lanceolatis, acutis, pedicello appressis suffultis, perigonii foliolis exterioribus latioribus, subnavido albicantibus apice recurvis, late connatis apice bidentatis; interioribus angustioribus, niveis, arcuato conniventibus, infra medium unipunctatis; labello unguiculato, subcar-noso, candido, trullaeformi, integerrimo, nudo, ungue brevi, supra convexo, subtus excavato, columna albida, recurva.

15. NOTYLIA PENTACHNE Rchb. fil. in Seemann Bonpl. II. 90. et Van Houtte Flore des Serres IX. p. 102. Rchb. fil. l. c.:

Racemo laxo, sepalis oblongo lanceolatis, sepali inferiori apicibus revolutis, gynostemio pubescente apice paulo ascendente labelli dimidium superante.

Veraguas. (Cf. infra). (v. v. c. et hab. sp. sicc.)

Huc: *Notylia Pentachne* Rchb. fil. in Xenii I. Tab. 20. II. 8—16. pg. 50:

Pseudobulbi oblongo ligulati ancipites vaginis scariosis acutis vestiti. Folia ob-longo ligulata acuta basi bene cuneata. Pedunculus elongatus subpedalis basi sub-nudus bi-trivaginatatus parte superiori racemosus, multiflorus. Bractee lineari seta-ceae ovarii pedicellati tertiam subaequant. Flores carnosuli illos *Notyliae punctatae* Lindl. (Bot. Reg. 759.) dimidio excedentes. Sepalum summum oblongum obtuse acutum fornicatum. Sepala lateralia in unum oblongo ventricosum extus (sc. infra) sulcato didymum connatum apicibus setaceis brevissimis fragillimis extrorsis seu re-curvis. Tepala lanceolata subcuneata, apice conniventia. Labelli unguis a lateribus compressus subaequilongus laminae hastatotrullaeformi, carnosae, basi ad utrumque latus unguis impressae, linea media sulcatae, apice acutae, carinaeformi ancipiti. Gy-nostemium apice incurvatum, velutinum, pulvinari pro caudicula recipienda maximo. Flores satore virides. Tepala candida basi guttis 2—4 aurantiacis prominulis. La-bellum album. Anthera et pollinarium genetica.

16. NOTYLIA CARDIOGLOSSA Rchb. fil. l. c.:

Racemo densiusculo, bracteis lineari subulatis ovaria pedicellata di-midio aequantibus, sepalis tepalisque lanceis, sepalo inferiori bifido la-ciniis revolutis, labelli ungue lamina duplo brevior, lamina cordato tri-angula (nec hastata!) apice bene attenuata, gynostemio sigmoideo glabro labello duplo brevior.

Guyana gallica. (Hab. sp. sicc.)

3) Sepala lateralia libera.

17. NOTYLIA TRISEPALA Lindl. in Paxt. Fl. G. III. p. 45. 1852:

Racemo gracili, tenui, ascendente, bracteis ovario brevioribus, se-palis clausis disjunctis, labello subhastato ecalloso.

18. NOTYLIA ORBICULARIS A. Rich. Gal. Ann. Se. Nat. 1845. p. 26. No. 80:

„Pseudobulbis ovoideo-triangulis, monophyllis; folio suborbiculari crasso coriaceo, obtuso; scapo nutante foliis duplo longiori: floribus viridibus. Mexico.“

1447 b. **COHNIA** Rehb. fil.

in v. Schl. Bot. Ztg. 1852. 928.

Perigonium connivens, membranaceum; phylla externa oblonga erecta, lateralia interna subaequalia, obtuse apiculata, labellum plano unguiculatum, inde in laminam orbicularem, postice utrinque obtusangulam, antice obtusam (igitur alte reniformem), cochlearem dilatatum; calli duo teretiusculi acuti antrorsi in basi unguis, anteposita carina rhombea; gynostemium breve, crassum, sub angulo obtuso in labellum pronum, antice utrinque brachiatum, brachia oblonga, obtusa, laminata, paulisper antice curvulo-ascendentia; androclinium postice unidentatum, ascendens, rostellum obtusum, per longitudinem unisulcatum, apice bilobulo, hinc quasi didymum. Anthera oblonga, obtusa, bilocularis. Pollinia depresso-pyriformia, postice biloba. Caudicula linearis; glandula parvula, quadrata (?).

1. **COHNIA** QUEKETTIOIDES Rehb. fil.

Eine seltene Pflanze. Ein fusslanges stielrundes Blatt und ein gekrümmter, absteigender, stielrundlicher, dünner Blütenstiel von 5—6 Zoll Länge sind von einer äusserst weiten, spitzen dürrhäutigen Scheide an ihrem Ursprunge verhüllt. Noch

zwei kürzere Scheiden stehen tiefer, die unterste von zahlreichen Luftwurzeln durchbohrt. Der Blütenstiel hat drei von einander entfernte, sehr spitze, kurze Scheiden. An der Spitze einige kleine Blüten; wenig grösser, als bei *Phymatidium*. Deckblätter dreieckig spitz, kürzer als Fruchtknoten. — Ehe die sehr genaue Beschreibung (L. F. Fasc. 1.) der *Quekettia* erschien, vermuthete ich, es möchte meine Pflanze dahin gehören. Ich finde grosse Anklänge an die von mir aufgestellten Gattungen *Sigmatostalix* und *Neodryas* — *Quekettia* wird wohl auch sehr verwandt sein. Es bilden diese vier eine eigenthümliche Gruppe — *Cohniaceae* — von den ächten *Rodriguezia-ceae* durch den Säulenwinkel, von *Papperitzia* durch den Lippengrund verschieden. Zu *Jonopsis* bieten mindestens die mir bekannten 3 Gattungen keine besondere Verwandtschaft.

1447 c. **PAPPERITZIA** *Rchb. fil.*

in v. Schl. Bot. Ztg. 1852. 670.

*Perigonii phylla ovalia, concava, apice linearia, subaequalia, lateralia externa in unum aequale connata, magis tamen saccato-excavata. Labellum basi cum marginibus gynostemii subcontinuum, ligulatum, canaliculatum, margines canalis ascendentes, ad laminam erectam, postice concavam, apice tridentatam; gibber antice in basi laminae in ligulam acutam, complicatam, inferne carinatam productae. Gynostemium humile, carnosum, antrorsum, utrinque alato-membranaceum, alae in brachia ligulata subito ascendentia subito superne producta; androclinium ascendens, postice grosse unidentatum, dein marginatum ad medium latus gynostemii, auriculatum; fundus androclini convexus, antrorsum in laminam triangulam, apice bidentatam productus. Anthera semipyriformis, semibilocularis. Pollinia 2, exacte globosa. Caudicula basi rotundata, convexa, antrorsum in ligulam linearem producta. Glandula ovata, minuta. Stigma minutum, sub processu rostellari. — Epiphyta mexicana, ebulbis foliis distinctis carnosis, racemo paucifloro, terminali(?). Affinis est *Rodrigueziae*, distat caudicula, gynostemio humili, polliniis, labelli fabrica. — Dicavi novum et insigne genus infausto amico b. William Papperitz.*

1. **PAPPERITZIA LEIBOLDI** (*Leochilus Leiboldi* *Rchb. fil.* *Linnaea* XVIII. p. 401.):

Ich quälte mich damals, diese Pflanze unterzubringen, weil ich mich scheute, eine neue Gattung aufzustellen. Ich habe aber schon damals ausdrücklich bemerkt, wie die Art von *Leochilus* bedeutend abwicke (vgl. daselbst). — Die hellpurpurfarbigen Blüten ziemlich fleischig; so gross etwa, wie die der *Rodriguezia secunda*. Herr Leibold versicherte, lebende Exemplare nach England gebracht zu haben, daher ich sie mit aufführe. Jedenfalls stammte sie von Zacuapan in Mexico, wo allein der Reisende gesammelt zu haben scheint.

1447 d. **NEODRYAS** *Rchb. fil.*

in v. Schl. Bot. Ztg. 1852. 834.

*Perigonium connivens (semper?), membranaceum, phylla externa oblonga acuta excavata, nervis extus valde prominulis, lateralia interna latiora, ovalia, acuta; labellum unguiculatum in laminam oblongam, transversam, excavatulam margine repandulam productum; callus elevatus, carnosulus sulcis apice retuso obtuse quadrilobulus, carinis 5 antepositis abbreviatis, duabus appositis in laminae basi ante unguem. Gynostemium in labellum medio ascendenti angulatum prominens, semiteres, antice (sc. inferne) canaliculatum, anguli antici auriti, aures oblongo-falcatae, ascendentes, bilobulatae, antrorsae, ima basi inferiore in lobulos stigma versus erectos (*Rodrigueziae* more) triangulos, parvulos productae. Androclinium vix marginatum, semirostundum, rostellum retusum, medio semicirculari introrsum excisum. Anthera pyriformis, dorso longitudinaliter unisulcata, hinc postice didyma, dissepimenta oblitterata.*

Pollinia gemina pyriformia, longitudinaliter angulata, solida in caudicula ligulata, glandula antice excisa transversa reniformis.

1. **NEODRYAS RHODONEURA** Rehb. l. c.:

Trugknollen länglich, schmal, nach oben verschmälert, zweischneidig. Das auf-sitzende Blatt lederartig, länglich lineal, unten verschmälert, oben spitz. Spitze umgebogen, auf der Unterseite gekielt. Wie es scheint stets nur ein derartiges Blatt unterhalb des trugknolligen Internodiums, die nächst-unteren Blätter sind längliche, spitze, gekielte, häutige Scheiden. Aus der Achsel jenes unterständigen Blattes entspringt der stielrunde, spannenhohe Blütenstiel, woran drei sehr von einander entfernte, enge, oben spitze Scheiden. Oben ist der Blütenstiel verzweigt. Jeder Zweig von deckblattiger, lanzettlicher, spitzer, kurzer Scheide gestützt, oberwärts zickzackig, an jeder Winkelspitze ein kurzes dreieckiges, spitzes, dunkles Deckblatt, welches kürzer als der Fruchtknoten. Blüten so gross, wie bei *Poly-stachya luteola*. Hüllblätter purpurn mit tiefer gefärbten Nerven; Lippe weiss (?), Säule (?) und Buckel der Lippe (!) gelb. — Höchst eigenthümlich durch die zickzackigen Blütenstielzweige (nach Art mancher *Pleurothallis*, aber dicker) und die zweizeiligen Deckblätter, die, ständen sie dichter, mich an *Bromheadia* erinnern würden. — Im System steht die Gattung nächst *Rodriguezia* und *Sigmatostalix*; das Rostellum zeichnet sie vor Allem aus. — Ich untersuchte die einzige vorliegende Blüthe, welche jedoch so vortrefflich getrocknet war, dass ich meine Resultate unbedenklich veröffentlichen. Bolivia. Bridges.

Rehb. fl. Xenia p. 38. Tab. XVI. 12–25.

1448½. **CHAENANTHE** Lindl.

Bot. Reg. (1838). XXIV. Misc. 60.

Perianthium ringens. Sepalum superius erectum; lateralia connata, basi productae columnae adnata, saccata, porrecta. Petala basi valde obliqua, et columnae productae adnata, revoluta, sepalis majora et magis membranacea. Labellum cum columna connatum, basi in calcar cum basi columnae productum, trilobum. Anthera antice truncata. Pollinia 2, pyriformia, in caudiculam linearem deflexa.

1. **CHAENANTHE BARKERI** Rehb. fl. l. c.:

Imp. by Geo. Barker Esq. of Birmingham from Para; who sent me specimens April last. Striking obliquity of flower. Lateral sepals are lengthened into a bag, which hangs down in front of the ovary; then the petals are stretched out at their base to adapt themselves to this; further, the labellum is connate with the column for nearly all its length, the latter being lengthened so as to fill up the bag of the sepals; and finally the anther is abruptly truncated in front, and the 2 pollenmasses are bent down upon the caudicula so as to lie almost parallel with it. Nearest all to *Notylia* in nat. affinity.

1451. **TRICHOPILIA** Lindl.

„Nat. Syst. Bot. Ed. 2. 446.“ Bot. Reg. XXII. 1863. — *Pilumna* Lindl. B. R. XXX. Misc. 74.

Lindl. Bot. Reg. l. c.: Sepala et petala aequalia patentia, angusta. Labellum magnum, petaloideum, convolutum, cum columna parallelum, trilobum, lobo intermedio subbilobo planiusculo; intus nudum. Columna teres, clavata. Clinandrium cucullatum, trilobum, villosu fimbriatum. Anthera unilocularis, compressa, antice convexa. Pollinia 2, postice sulcata, caudiculae tenui cuneatae adhaerentia; glandula minima. — Pseudobulbi carnosi, vaginis maculatis supertecti, monophylli, coriacei. Flores solitarii axillares.

a. Folia carnosā, demum subteretia.

1. TRICHOPILIA HYMENANTHA Rchb. fil. Bonpl. II. 90. et Xenia I. p. 15. Tab. VII. 1—11 :

Folio tereti mucronato sulcato, racemo plurifloro (4—7), labello orbiculato subtrilobo denticulato, androclinio utroque angulo basilari unibrachiolato.

Folium teretiusculum, utrinque attenuatum, apice mucronatum, superne sulcatum fere Brassavolae cordatae Lindl., 8—9 pollices longum in internodio teretiusculo caulis. Pedunculus (forsan ex vagina stipante caulis axillaris?) gracilis, 4—6 pollicaris, apice racemosus. Bractee membranaceae oblongae acutae seu lanceolatae acutae apice dilatatae subcucullatae ovaria pedicellata inferiora aequantes. Sepala ac tepala subaequalia lineari lanceolata undulata seu torta candida. Labellum orbiculatum seu ellipticum, sinu obsolete in utroque margine trilobulum, apice acutiusculum seu emarginatum, margine anteriori et lateribus minute serrulatum denticulatum; laeve; basi cochlearum callo ascendente foveato vertice retuso utrinque antice unicurvi, utroque latere foveato (exactly uti in *Trichopilia tortili*), ima basi gynostemii faciei inflamae adnatum; candidum, punctulis purpureis in basi. Gynostemium subsemiteres; androclinium horizontale seu descendens; rostellum triangulo bidentatum ascendens; limbus valde membranaceus, cucullatus, antrorsus, margine denticulatus, basi utrinque super angulum gynostemii linearis apice fimbriolatus; foveae triangulae seu oblongae limbus tumidus haud ita productus. Anthera oblonga, per dorsum jugo carinatum. Pollinia linearia, utrinque obtusata, postice sulcata; caudicula linearis, glandula minuta.

Rchb. fil. in Bonpl. II. 280: Ocanna 3000'. Juli 1849. Schlim. N. 29:

Huc: *Leucohyle* Kl. Mss. in App. Sem. Berol. 1854:

Perigonii foliola subaequalia libera acuminata incurva, exteriora et interiora conformia. Labellum liberum integrum sessile columnae parallelum, circa columnam excavatum. Columna erecta arcuata deorsum attenuata subteres ovario continua. Androclinium dorso appendiculo membranaceo cucullato, antice dentato-fimbriato instructum. Anthera bilocularis. Pollinaria 2, pyriformia, candida, postice sulcata; caudicula filiformi, glandula reclinata parva. Herba peruana epiphyta caespitosa, pseudobulbis parvis teretibus monophyllis; foliis carnosis anguste oblongis recurvis dorso rotundatis, supra canaliculatis; racemis erectis basilaribus paucifloris.

Leucohyle Warszewiczii Kl.

Racemis 2—3-floris folio quintuplo brevioribus; floribus albidis; perigonii foliis elongatis incurvis acuminatis, basi attenuatis; labello elliptico excavato cuspidato, supra pallide purpureo-punctato. Pseudobulbi pollicem longi, pennae anserinae crassitudine. Folia 7 poll. longa, 4 lineas lata. Racemus pollicem longus. Perigonii foliola 8 lin. lata. Labellum 7 lin. longum et 5 lin. latum. — In arboribus Peruviae: de Warszewicz. Floruit M. Novembri. (Vid. typum! Rchb. fil.)

Rchb. fil. Bonpl. III. 215: Foliis junioribus lineariligulatis carnosis canaliculatis, vetustis demum convolutis, hinc quasi teretiusculis.

2. TRICHOPILIA MUTICA Rchb. fil. Wullschl. Mss. Huc: *Macradenia mutica* Lindl. Bot. Reg. (1839.) XXV. Misc. 22:

Foliis coriaceis lineari-lanceolatis dorso convexis, racemo prostrato trifloro bracteis oblongis obtusis-cucullatis pedicellis aequalibus, labello cordato-ovato acuto basi cucullato medio transverso, clinandrio serrato, rostellulo mutico.

Folia solitaria, lineari lanceolata, coriacea, avenia, dorso convexa, caulibus brevibus compressis teretibus insidentia. Racemus radicalis triflorus, debilis, bracteis brevibus, cucullatis, striatis, sphacelatis. Flores sordide albi, rubro brevissime tincti. Sepala et petala aequalia, linearia acuta, explanato-patentia. Labellum cum columna parallelum, nec articulatum, cordato-ovatum, acutum, basi cucullatum; callo elevato canaliculato, transverso. Columna semiteres, labello duplo brevior; clinan-

drio cucullato denticulato. Anthera parva, in fundo cuculli, 2-ocularis, cristata. Pollinia 2, caudicula brevi lineari. Rostellum nullo modo elongatum.

Small, with dingy white flowers. Flowered with Mr. Knight, of the Kings Road, Aug. 1835. Trinidad it is said to be nat. of.

b. Folia plana.

3. TRICHOPILIA LAXA Rehb. fl. in Otto Hamb. Gartenztg. 1858. 229. Iluc: *Pilumna* Lindl. Bot. Reg. XXX. 1844. Misc. 74:

Ovarium tricostatum. Sepala et petala aequalia patula oblique inserta. Labellum basi columnae adnatum, subintegrum, unguiculatum, convolutum, inappendiculatum. Columna clavata, teres, clinandrio cucullo dentato membranaceo circumdato; buccis duabus carnosis semiclausum. Stigma verticale. Pollinia 2, postice fissa, caudiculae brevi et glandulae ovatae adnata.

Herbae epiphytae pseudobulbis vaginatis, foliis coriaceis, pedunculis radicalibus. Genus *Aspasiae* proximum, clinandrio cucullato, columna tereti, nec non stigmatate verticali nec faciali diversum.

Pilumna laxa Lindl. l. c. et 1846. tab. 57:

Folio lineari-oblongo, racemo laxo, multifloro brevior, bracteis laxis, cucullatis obtusis, sepalis petalisque lineari lanceolatis, labello oblongo indiviso rotundato medio constricto per axin unilamellato.

In the woods of Timbio near Popayan. Hartweg. — Flowers are produced in loose erect racemes, out of broad obtuse short membranous spotted bracts. The stalks and ovaries are an inch and half long; the latter with three very stout and strong ribs. The sepals and petals are a pale watery green, erect linear-lanceolate, equal, faintly tinged with purple. The lip is cream-colour, rolled round the column at the base, to which it also is united at the lower end. The column has a singular fringed hood, overlying the anther, and a nearly vertical stigma, closed in by fleshy inflated cheeks. In these circumstances it differs from *Aspasia* to which the genus is nearly akin. It flowered with Mr. Barker and is said to have been purchased at Mr. Skinner's sale, and must if there is no mistake in the matter, have come from Guatemala. It is however so exactly like spec. found in Popayan by Mr. Hartweg, that we cannot help suspecting some error.

Rehb. fl. Bonpl. II. 15. Merida 7000'. Die wilde Pflanze hat viel grössere kappige Deckblätter, als die cultivirte. Dazu steht der starke 6—7 blüthige Pedunculus starr ab, während er bei den Culturpflanzen herabhängt. Wagener.

4. TRICHOPILIA FRAGRANS Rehb. fl. in Otto Hamb. Gtz. 1858. p. 229. Iluc: *Pilumna fragrans* Lindl. Bot. Reg. XXX. 1844. Misc. 74:

Folio lato oblongo, racemo trifloro brevior, bracteis lanceolatis erectis, obtusis, sepalis petalisque oblongo lanceolatis acuminatis, labello oblongo apiculato subtrilobo laevi.

Near the city of Popayan. Flowers large, white, sweetscented, with an orange coloured spot on the lip, according to Mr. Hartweg. —

Lindl. Orch. Lindl. 1846. p. 13: Pseudobulbs compressed, long, oval, obtuse etc. Epiphyte from the dark and damp forests of Merida. 5000'. Flowers white, as snow. Juli 1842. N. 649. *Trichopilia candida* Linden.

Obs. Nondum rite perspicio, num *Pilumna nobilis* Rehb. fl. — conf. Walp. Ann. III. 541. — huc pertineat.

5. TRICHOPILIA WAGENERI Rehb. fl. l. c. Iluc: *Pilumna Wageneri* Rehb. fl. Bpl. II. 15:

Pseudobulbis ancipitibus obtusanguloquadratis, foliis —, pedunculo quinquepollicari trifloro, bracteis oblongis apiculatis tertiam ovarii pe-

dicellati aequantibus, sepalis tepalisque paulo latioribus lineari lanceolatis basi angustatis, sepalis lateralibus labello Myanthiorum more suppositis, labello a basi cuneato angusto dilatato in laminam trilobulam antice apiculatam, carina elevata a basi medium usque progrediente, androclinii cucullo lacero fimbriato postice producto.

Sepala und Tepala grün, Lippe weiss mit orangegelbem Grunde. *P. nobilis* R. fl. ist verschieden durch ganz weisse Blüten von viel häutigerem Gewebe, die Lippe ist nicht allmählig, sondern plötzlich ausgebreitet, so dass man sagen kann: labelli lamina utrinque semicordata; ferner ist der Rand sehr stark gekräuselt, endlich ist die Mittellinie nur erhaben, während hier ein starker Kiel da ist, auch findet sich die Säule des Androclinium viel feiner gewimpert. Schwerer war die Entscheidung, ob die Pflanze nicht die ungenügend beschriebene *P. candida* wäre. Diese soll haben stumpfe Deckblätter, eine ganz glatte Lippe, schneeweisse Blüthe mit gelbem Fleck. Sie soll gleich sein *Trichopilia? candida* Linden. Herr Linden versendet als *Cymbidium candidum* Individuen der *Pilumna laxa*, die Andere auch *Aspasia candida* nennen. Bei Aufstellung der Gattung wurde sie mit *Aspasia* verglichen. Daß ist sehr leicht, sie muss ferner mit *Trichopilia* verglichen werden. Die Gestalt der *Caudicula* ist so ziemlich der einzige irgend haltbare Unterschied dieser Gattungen. Die Blüten der vorliegenden Art so gross wie die der *Trichopilia tortilis*. Caracas. 5000'. April. Wagener.

6. TRICHOPILIA MACULATA Rehb. fl. Bonpl. III. 215:

Affinis *T. albidae* Wendl. fl. pseudobulbis quadratis obtusangulis compressis latitudine duplo longioribus, vaginis obscure maculatis, foliis subtus punctulatis, sepalis semel tantum semitortis, antherae crista praerupta ultra loculos producta nec fasciculato papillifera more *T. albidae*.

Blüthenhülle gelb. Lippe und Säule weiss. Lippe von keilförmigem Grunde ausgebreitet, vorn beiderseits stumpfeckig; mit vortretendem ausgerandeten Mittellappen. Säule am Grunde mit dreieckiger Fläche der daselbst dickfleischigen Lippe angewachsen. Narbe länglich unten ohne einspringende Ecke. Androcliniumsäum dreilappig, Lappen fein gezähnt. Port Chagres, gesammelt von Hrn. Dr. Behr. Blüthe in Herrn Kefersteins Sammlung zu Kröllwitz unter Hrn. Lehmann's Cultur.

7. TRICHOPILIA ALBIDA Herrm. Wendl. Berl. Allg. Gtz. 1851. 362:

Pseudobulbis oblongo-lanceolatis, compressis, sulcatis, monophyllis, foliis oblongo lanceolatis, planis, basi subcordatis, apice acuminatis, recurvis; racemis basilaribus pendulis, subtrifloris; perigonii foliolis conformibus, linearilanceolatis, acuminatis, undulatis, rectiusculis, subtortis, pallide luteo viridulis, margine subhyalinis; labello petalis longiore, quadrilobo, lobis rotundatis undulato crispatis, basi arte convoluto, albido, fauce punctis luteo-ochraceis confluentibus adspersa; cucullo trilobo, laciniis fimbriatis, media longiore.

Blüthenblätter 1½" lang, 3" breit; blassgelb-grünlich, am Rand fast durchsichtig. Labellum ist glatt, wenig länger, als Blüthenhülle; Narbe vierlappig. Auf Mitte der Lippe einige unregelmässig erhaltene Längsstreifen; Blütenfarbe ist weiss, in der Mitte durch gelbe ockerfarbige Punkte. Hat längere Scheinknollen als *Trichopilia tortilis*, coccinea. — Caracas. Wagener. — Cf. Lindl. Paxt. Fl. G. III. 28. — Rehb. fl. Bonpl. II. 15. Caracas. Aug. 1850. Wagener. — Regel Gartenfl. III. 78.

8. TRICHOPILIA SUAVIS Lindl. Paxt. Fl. G. I. p. 44. (Walp. Ann. III. p. 553.) et p. 53. Tab. 11:

Additis: cuculli trilobi laciniis omnibus fimbriatis intermedia angustiore. — Van Houtte Fl. Serr. VIII. 761. — Hook. B. Mag. 4654. — Lem. Jard. Fl. III. 277.

9. *TRICHOPILIA MARGINATA* Henfr. Gard. Mag. Bot. Jul. 1851. c. fig. — *Trichopilia coccinea* Wsewz. corresp. gard. Lindl. Paxt. Fl. G. II. 80. tab. 54:

Pseudobulbis angustis compressis, sulcatis, monophyllis, foliis lanceolatis planis basi subcordatis apice acuminatis recurvis, pedunculis unifloris, petalis linearilanceolatis acuminatis semel tortis, labello 4-lobo, lobis rotundatis convexis planis basi erecto convoluto, cuculli trilobi laciniis fimbriatis subaequalibus. Central - Amerika. Wrswez. — Hook B. M. 4857. — Lem. Jard. Fl. tab. 184. (ex Gard. Mag. mutuata icon).

10. *TRICHOPILIA GALEOTTIANA* Rich. et Gal. tab. 31. Ann. sc. nat. 1845. p. 26:

Pseudobulbis teretibus cauliformibus, 1-phyllis; scapo 1-floro; flore maximo luteo, sepalis planis.

Mexico.

11. *TRICHOPILIA TORTILIS* Lindl. Bot. Reg. XXII. (1836.) Tab. 1863:

Pseudobulbi oblongi, sulcati, compressi, vaginis fusco maculatis arcte vestiti, aliquando folii fere longitudine. Folia solitaria, oblonga, coriacea, acuta, plana vel leviter complicata. Flores solitarii, axillares; horizontales, sessiles. Sepala et petala aequalia, linearilanceolata, patentissima, spiralter torta, margine crispata, fusco lutea, disco brunnea. Labellum 2 pollices longum, circa columnam convolutum, album, maculis pluribus magnis inaequalibus ad interius, limbo trilobo, intermedio subbilobo. Columna cum ovario continua, teres, clavata, alba; clinandrio cucullato, trilobo, lobis descendentes, falcatis, ciliato laceris. Anthera compressa, apiculata. Pollinia 2, parva, pyriformia, postice sulcata, caudicula cuneata inserta, glandula minima ovali. Gynizus excavatus, paululum oblique retrorsum versus. — Mexico imp. Barker. — Floral Cab. III. 101. — Bot. Mag. 3739.

Obs. Icon B. Reg. mihi haud grata. Flores terminales depicti!! Rehb. fil.

1451/1. **DIGNATHE** Lindl.

Hort. Soc. Journ. II. 268.

1. *DIGNATHE PYGMAEA* Lindl. in Hort. Soc. II. 268:

Pseudobulbus squamatus monophyllus. Flos solitarius resupinatus carnosus. Sepala et petala patentia aequalia. Labellum planum recurvum basi subsaccatum et per lamellas 2 carnosas columnae adnatum. Columna nana, acuta, semiconica, clinandrio dorsali immarginato. Anthera —? Pollinia 2, caudicula lineari, glandula parva ovali.

Genus *Pilumnae* et *Aspasiae* affine. Columna nana, clinandrio dorsali immarginato et habitu quodam valde diversum.

Mexico. Messrs. Loddiges. Inconspicuous. Whole plant is barely 2 inches high, and forms little tufts like an *Alemania* or *Dinema*. Pseudobulbs oblong, buried in leathery acute scales. The leaves are solitary, oval, stalked, 3-toothed at the point. Peduncle is solitary from the base of the pseudobulb, oneflowered, as long as the short keeled petiole. A keeled acuminate membranous bract is larger, than the ovary; the tiny flower is green, fleshy with a few yellowish spots upon its disk and the 2 succulent plates that unite it to the column. Both plates and column are downy.

1451/1. **HELICIA** Lindl.

Bot. Reg. XXXI. (1845.). Misc. 26.

Sepala et petala coriacea conformia, patula. Labellum patulum membranaceum, planum, medio constrictum, basi utrinque appendice carnosae truncata medio foveata in lineas 2 breves elevatas procurrente auctum, ipsa basi excavatum pilosum. Columna libera, teres, clinandrio

erecto undique fimbriato. Anthera carnosae, in pileum solidum obtusum producta, bilocularis. Pollinia 2, postice excavata, caudicula cuneata, glandula parva ovali. Herbae pseudobulbosae, foliis solitariis, coriaceis, undulatis, pedunculo radicali.

The relationship of this plant is evidently greatest of *Trichopilia*. It is however also an associate of *Aspasia*, from which it differs in not having the lip united to the column, and in its deep fringed antherbed.

1. *HELICIA SANGUINOLENTA* Lindl. Bot. Reg. XXXI. (1845.) Misc. 26 :

Pseudobulbi ovati, elongati, subteretes. Folia 4—6 pollicaria, undulata, basi in petiolum canaliculata angustata. Pedunculus pseudobulbis brevior, uniflorus, bi-bracteatus. Sepala et petala olivacea, fusco sanguineo maculata. Labellum album striis sanguinolentis, obovatum, emarginatum, appendicibus luteis denticulatis striatis.

At Paccha in the Andes of Guayaquil. Hartweg.

Lindl. Paxt. Fl. G. II. p. 97. Nr. 362. Xyl, 182: Greenish flower banded with brown, white lip with broken crimson veins. Paccha, Andes of Guayaquil. Approaches *Trichopilia*. Instead of its column being rolled up in the labellum, it stands erect and clear of it; instead of the antherbed having two lacerated processes, it is surrounded by a deep fringed border; finally instead of the lip being perfectly smooth, continuous and destitute of all appendages at the base, it is contracted about the middle, below the contraction furnished with a pair of thick fleshy lobes hollowed out in the middle standing erect on each side of the column, without however touching it; and the space between these lobes forming the very base of the lip in a hollow hairy pit.

1452. *IONOPSIS* H. B. Kuth.

Humb. Bonpl. Kunth, Nov. Gen. et Sp., I. 348. LO., p. 193. — *Iantha* Hooker, Exot. Fl. t. 113. — Lindl. Folia. I. Oct. 1. 1852:

Sepala erecta, aequalia, membranacea; lateralibus in saccum connatis. Petala sepalis conformia. Labellum membranaceum, sepalis longius, columna parallelum, limbo reflexo; basi angustatum, auriculis 2 membranaceis intra marginem callisque 2 carnosus intra auriculas. Columna erecta, nana, aptera, semiteres, rostello rostrato. Pollinia 2, cereacea, sphaerica, postice excavata; caudicula lineari; glandula obovata. Anthera unilocularis rostrata. Herbae epiphytae, Americae tropicae, acaules. Folia coriacea. Flores in racemis aut paniculis terminalibus dispositi, albi aut violacei.

Short erect sepals of which the lateral form a small bag, a long lip reflexed at the upper half, and furnished at the base with four processes of which two are thin membranous auricles within the edge of the lip, and two much more fleshy calli within the auricles themselves, distinctly limit this little genus, the species of which are however very difficult to distinguish in herbaria. The two auricles above mentioned have been hitherto mistaken both by myself and others for the edge itself of the lip, owing to their extreme thinness and the consequent difficulty of observing them in dried flowers. The generic character in LO., p. 193, moreover, wrongly, states, that the lateral sepals are united to a lip, which is saccate at the base. Such appears at first sight to be the case; but in reality the base of the lip adheres only to the base of the column, and the sac is formed entirely by the union of the base of the sepals.

1. *IONOPSIS SATYRIOIDES* Rchb. fil. Mss. Huc: *Ionopsis testiculata* L. O. 193. Fol. 1:

1. foliis tereti-subulatis, sepalis acutis basi connatis, petalis longioribus obtusis apice patentibus, labello ovato-acuminato, sacco didymo-ventricosos.

Epidendrum Satyrioides Swartz, Prodr. 123.

Dendrobium testiculatum Swartz, Fl. Ind. Occ., p. 1533.

Leaves two or three inches long. Scape filiform, three or four times as long as the leaves, simple or occasionally divided, few-flowered, with some minute sheathing scales. Flowers from three to six, small, appearing in the spring, white, with the fragrance of violets. Lip and petals veined with crimson.

Wild in the West-Indies, occasionally; on the mountains of St. Domingo and Jamaica, on the Crescentia—Swartz.

2. IONOPSIS TERES Lindl. B. Reg. 1838. M. 181. l. c. F. sub 2:

I. foliis teretibus, scapo simplici filiformi paucifloro, sepalis acutis lateralibus semiconnatis, labello obovato-lanceolato apice undulato quasi trilobo, callis magnis conspicuis.

Flowers small, white. Petals obtuse, and lip with crimson veins. The three-lobed lip appears to separate this from the last; whether the sac is didymous or not I have not been able to ascertain.

Wild in Demerara—Schomburgk.

Lindl. l. c.: „imp. Loddiges.“ — „Labello obovato lanceolato apice undulato quasi trilobo, medio bilamellato.“

3. IONOPSIS PALLIDIFLORA Lindl. B. Reg. sub 1904. l. c. F. sub 3:

I. foliis angustis oblongis basi carinatis, scapo simplici, sepalis petalisque obtusis, labello bilobo plus duplo longiore, sacco didymo ventricosos.

Iantha pallidiflora Hooker, Exot. Fl. t. 113.

Flowers white, with purple stripes. Leaves, according to Hooker, binate, flat, emarginate; according to a drawing in my possession, oblong, acute, distichous. The plain leaves and didymous sac are peculiar to this species.

Wild in Trinidad—De Schack, Lockhart.

4. IONOPSIS BREVIFOLIA A. Rich. Gal. Ann. sc. N. 3. III. 26. Lindl. l. c. sub 4:

I. „foliis binis recurvis oblongis apice acutissimis, scapo 3-4-floro, floribus violaceis, sepalis basi saccatis, labello triplo longiore obcordato profunde bilobo.“

Known only from the above short character. The expression „sepalis basi saccatis“ seems to point to a testiculate form like that of *I. pallidiflora*.

Wild in Mexico—Galeotti.

5. IONOPSIS UTRICULARIOIDES Lindl. Coll. Bot. 39. A. Lindl. l. c. sub 5:

I. foliis oblongis acutis carinatis, racemo brevi subpaniculato, sepalis acutis, petalis obtusis, labelli subbarbati limbo cuneato bilobo sepalis brevioris, sacco simplici.

Epidendrum utricularioides Swartz, Prodr., 122.

Dendrobium utricularioides Swartz, Fl. Ind. Occ., 1531.

If the plant figured in the „Collectanea Botanica“ be taken to be that, which Swartz meant by *D. utricularioides*, then the very short limb of the lip will be its principal mark of distinction from the succeeding species, as far as I am at present able to determine, no specimen of it having been preserved in my herbarium. The flowers are very small, white, with red veins to the petals and a few red spots to the lip. The localities given in L. O. probably refer to other species. I have seen no Jamaica specimens.

Wild in Jamaica, in the driest plains, on the branches of Logwood and Citron trees—Swartz; Trinidad—Woodford.

Huc: *Ionopsis tenera* Lindl. in B. Reg. t. 1904. Paxton's Flower Garden; gleanings, N. 276, ic. 141. Fol. l. c. sub 6:

I. foliis rigidis acutis sulcatis basi carinatis, scapo racemoso vel pa-

niculato coarctato, sepalis petalisque acutis subaequalibus, labelli pubescentis limbo bilobo sepalis multo longiore; auriculis rotundatis, sacco simplici.

(A.) Flowers racemose, white, with a pink stain at the base of the lip.

(B.) *zonalis*. Flowers racemose, with a pink lip, and a broad purple band at the base.

Ionopsis zonalis Lindl. in Paxt. l. c.

(C.) *tomentosa*. Flowers panicled, smaller than usual; white with a pink lip.

(D.) *effusa*. Flowers panicled, smaller than usual; with a nearly smooth lip.

(E.) *violacea*. Flowers deep purple, in a large contracted panicle.

The above forms, although in some respects different, do not appear to possess any clear marks of distinction. In *zonalis* the auricles are more fleshy than usual, and the calli are white; in *tomentosa* the flowers are smaller, as well as panicled, with an unusually downy lip.

Wild in tropical America; A. in Cuba Captain Sutton; C. in the Caracas near Guarenes Funck and Schlim; D. at Sochiapam, on the frontier of the departments of Oaxaca and Vera Cruz Hartweg; E. on old coffee trees of Yatera and Mount Liban in Cuba, 2000 to 3000 feet Linden, Nr. 1760.

Obs. Specimina Swartziana juxta manus habeo. Inde omnis *I. tenera* est antiqua *I. utricularioides* cujus varietates: zonalem, tomentosam, effusam, violaceam distinguamus. Icon in Lindl. Coll. Bot. mihi specimen miserum, aegrotum refert. R. fil.

6. IONOPSIS PULCHELLA H. B. K., Nov. Gen. et Sp., pl. I., 348, t. 83, L. O. 194. L. F. 7:

I. foliis lanceolato-linearibus acutis planis coriaceis basi carinatis, scapo subsimplici, sepalis lanceolatis acuminatis patulis, petalis duplo majoribus obtusis, labelli limbo obcordato sepalis multo longiore, auriculis rotundatis, sacco simplici.

Of this *I* I have seen no certain specimen. It appears to differ from *I. tenera* in having much narrower smaller leaves, and a larger lip, with long obtuse petals. The leaves, according to Kunth, are from two to three inches long, and not more than three lines broad. I now refer the Cuban plant of Linden („Orch. Lindl.“, Nr. 125) to *tenera*. An examination of original specimens can alone determine whether the two are really distinct.

Wild in New-Granada; in warm temperate places between Carthagen and Buga, on the trunks of Guava and Calabash trees, at the height of 2928 feet, flowering in October Humboldt and Bonpland.

Rchb. fil. in Bonpl. II. 14. Carabobo. 4000'. Wagener.

7. IONOPSIS GARDNERI Lindley, in Paxton's Flower Garden, sub Nr. 276. Lindl. F. sub 8:

I. foliis longis planis acutis, scapo paniculato diffuso, sepalis petalisque acuminatis subaequalibus, labelli pubescentis limbo obcordato sepalis multo longiore; auriculis semicuneatis obtusangulis, sacco simplici.

A much smaller-flowered plant, than *I. paniculata*, which it resembles, with very sharp instead of obtuse petals. The auricles of the lip are not rounded, but broader in front so as to resemble a blunt-angled wedge but in half.

Wild in Brazil; on trees and banks at Parahiba: March, 1841 Gardner, Nr. 5875.

8. IONOPSIS PANICULATA Lindl. in Bot. Reg. sub t. 1904. Fol. l. c. sub 9:

I. foliis lineari-lanceolatis carinatis, scapo paniculato diffuso, sepalis acutis, petalis obtusis apiculatis longioribus, labelli pubescentis limbo rotundato bilobo sepalis multo longiore; auriculis rotundatis, sacco simplici.

Epidendre paniculé Descourtilz, Epid. Bras. ined. in Bibl. De Lessert, t. 51.

The scape of this fine species is above eighteen inches high, loaded towards the summit with gracefully bending branches covered with snow-white or delicate rose-

coloured scentless flowers, which, according to Descourtilz, remain fresh from September or October to the following May.

Wild in Brazil—Martius; in the primæval forests of St. Pauls—Descourtilz; near Santarem, in Para—Spruce.

Obs. In Benth. pl. Hartw. 72. planta mexicana a collect. Hartweg lecta, ad *I. paniculata* relata, quæ nunc sub *I. tenera* affertur. Omnino timeo, ne tota *I. paniculata* varietas sit *I. utricularioidis* Lindl. per vastum Americæ tropicæ spatium dispersæ.

1452^b. **CLOWESIA** Lindl.

Bot. Reg. XXIX. (1843.) Tab. 8. Misc. '39.

Flos subglobosus, patulus. Sepala subæqualia, lateralia paulo obliqua, in mentum breve producta, basibus connatis. Petala conformia latiora, fimbriata. Labellum concavum, carnosum, cum labello continuum nec articulatum, obsolete trilobum, margine in fimbriam glandulosam laceram solutum, disco laeve. Columna semiteres, clavata, utrinque apice obtuse cornuta, clinandrio alto carnosio serrato. Stigma: sinus transversalis. Pollinia 2, linearia, dorso sulcata, glandula subrotunda, caudicula membranacea clepsydraeformi.

Caulis carnosus, foliosus. Scapus radicalis, multiflorus, erectus. Perigonium candidum, fimbriis marginibusque roseis.

1. **CLOWESIA ROSEA** Lindl. l. c.:

It is a native of Brazil, and flowered at Broughton Hall, near Manchester, with the Rev. Mr. Clowes, a zealous cult. At a later period (March last) we received it from Sion Gardens (Duke of Northumberland.)

The inflorescence proceeds from the base of the stems (not apex as was formerly stated on the authority of Mr. Clowes's gardener, who thought apex signified the bottom.) —

Lindl. l. c. Misc. 39: Its flowers have the chin of the Maxillarid division, but they differ entirely from all the genera in the peculiar structure of the pollenmasses and of the petals. — Mr. Clowes's gardener says: pseudobulb is 2½" long, covered with a thin brownish white sheathing; each has 2—3 small dark brown bands, which surround it, and are apart from each other ½". Leaves 3,7" long, 1" across, lanceolate ovate, acuminate at the point, twisting a little on one side. Both leaves and pseudobulbs are in the way of Catasetum. The scape rises from the apex of the pseudobulbs.

1452^c. **SUTRINA** Lindl.

Ann. Nat. Hist. X. 1842, 184.

Perianthium cylindræum, clausum. Sepala coriacea, lateralia fere ad apicem usque connata, basi subsaccata. Petala membranacea, conformia. Labellum liberum unguiculatum, supra basin medio elevatum, oblongum, concavum, indivisum. Columna basi teres, sursum dilatata, apice utrinque alis falcatis instructa; clinandrio antice bidentato. Anthera membranacea, semibilocularis, antice membrana lata circulari cristata. Pollinia pyriformia, solida, caudiculae lineari in glandulam longissimam setaceam incumbentem affixa.

Herba glabra, epiphyta, pseudobulbosa, foliis solitariis coriaceis, spica multiflora pendula.

Near *Macradenia*. This very curious genus is probably related to *Macradenia*, but its habit and structure are in all respects very peculiar. The gland resembles a long bristle or cobbler's awl and projects beyond the column extending as far as its long falcate arms. The anther, which is globose, where the pollen lies, is furnished in front with a broad circular crest.

1. SUTRINA BICOLOR Lindl. l. c. p. 185 :

Pseudobulbi parvi, ovati. Folia 2—3 pollices longa, ovalia, subsessilia. Spica 3—4 pollices longa. Bracteae breves squamaeformis. Flores 7 lineas longi. Sepala oblonga apiculata apice recurva, verosimiliter viridia. Labellum apice rotundatum, crispum, luteum.

Peru, Matthews, herb. Hooker.

1453. **DIADENIUM** Pöpp. Endl.

Nov. Gen. et Sp. I. Tab. 71! p. 41.

Rehb. fl. Xenia I. p. 13. Tab. 6. III. 13—23:

Diadenium gynostemio superiori Rodrigueziaeis haud alienum, mento tenuissimo in calcar spurium extenso ac labelli insertione ab omnibus longe dissimile Pelexiam inter Vandeas ludens.

Flos tenuimembranaceus, clausus. Sepalum summum lanceolatum acutum; sepala lateralia subaequalia basi tamen producta in calcar extinctoriiforme acutum antice usque regionem supraapicularem fissum. Tepala cuneato ovata acuta. Labellum panduratum, antice rotundatum; anguli postici erecti, callo parvo interjecto; in unguem linearem lamina longiorem extensum auriculis acutis retrorsis parvis suprabasilaribus sagittatum; insertum in ipso sinu tepalorum lateralium antice confluentium supra basin calcaris omnino Pelexiae more. Gynostemium semiteres, gracile: margine pone foveam utrinque arcuato excisum, infra foveam ellipticam producto unigibbosum, dein iterum angustatum in nervum medium calcaris extinctoriiformis evanescens; cum tepalo summo parallelum; androclinium oblique ascendens, hinc lobulatum; rostellum lineare, retusum, descendens intra angulos anticos gynostemii. Anthera ovata, antice attenuata, retusa, inferne limbo reflexo submarginata, prope unilocularis; pollinia et basin caudiculae tantum tegens. Pollinia depresso pyriformia, sessilia in disco caudiculae. Caudicula a basi rotundata denticulata longe attenuata in apicem linearem, retusum, sessilem in glandula rotunda minuta.

DIADENIUM MICRANTHUM Pöpp. Endl. Nov. Gen. ac Sp. I. Tab. 71. p. 41.

Pseudobulbus minutus, vix semipollicaris, a vaginis laxis et folio uno cuneato oblongo acuto stipatus, apice folio illi subaequali monophyllus. Pedunculus axillaris in folio summo stipante, gracilis, teres (ramosissimus? tota, quam cl. Pöppig pinxit inflorescentia producta est ex axilla vaginae a basi quartae pedunculi, dum decisa est tota pars superior inflorescentiae!!), rarivaginatus, vaginae apice acutae; ramus lateralis, qui suppetit superne secundo paniculatus; rami ramulique tenues, bracteae triangulo acuminatae brevissimae. Flores hyalini, ab apice sepalii summi ad calcaris apicem lineam curvam subsemipollicarem describentes, rosei fuisse videntur.

Die Originaletikette des Wiener Museums sagt: „Unicum specimen legit Peruvia subandina. Supra arborea, Cuchero. Febr. 1830.“ Das Exemplar ist mit einer leimigen Masse zusammengeklebt, doch dürften die beschriebenen Verhältnisse richtig sein. Die Blüten sind sehr gequetscht und nur wenige vorhanden. Einen unerklärlichen Widerspruch bietet die Angabe a. a. O.: „Crescit in Peruviae sylvestribus arboribus convallium ad Cuchero, v. c. ad pedem Cerro de S. Christobal.“ Das „v. c.“ lässt auf allgemeine Verbreitung schliessen. Keiner der andern Sammler, welche Peru bereisten, scheint diese Pflanze je erspäht zu haben, selbst die scharfsichtigen Ruiz, Pavon und Dombey nicht.

1454. **COMPARETTIA** (Pöpp. et Endl.) Lindl.

(Nov. Gen. et Sp. I. 43. t. 73.) B. Reg. XXIV. (1838), 68.

Perianthium ringens. Sepalum intermedium et petala nana, libera, subgaleata; lateralia in unum connata calcaratum labello suppositum.

Labellum liberum, explanatum, obcordatum, unguiculatum, basi calcaribus duobus intra sepalorum calcar absconditis. Columna libera, erecta, mutica. Pollinia 2, postice foveata, caudiculae uncatæ rostratæ adnata. Herba epiphyta, pseudobulbosa, racemis terminalibus.

„Named after Andreas Comparetti, Prof. at Padua, who first understood the real nature of spiral vessels, and who wrote with great skill upon Vegetable Physiology.“ Pöpp. and Endl.

1. **COMPARETTIA FALCATA** Pöpp. Endl. l. c. Tab. 73: Lindl. in Benth. Pl. Hartweg 93: in montibus Arcutuno et Medio Monte Mexici. Hartweg. — Lindl. Orch. Lind. p. 24: „an epiphyte on the Psidium and Crescentias, in the neighbourhood of Merida 50000. Flowers bright carmine“ 658. Linden. — Rchb. fil. in Bonpl. II. 280: Ocanna. Juni 4—5000'. N. 747. Schlim! — Rchb. l. c. Bonpl. 66. Ocanna 4000'. März. Wagerer. — Bot. Mag. 4980.

Huc: *Comparettia rosea* Lindl. Bot. Reg. XXVI. (1842.) Misc. 186:

Foliis subsessilibus, racemo pendulo laxo paucifloro, labelli lamina subrotundo-oblonga, calcar subulato brevior.

Little delicate O. from the Spanish Main, with a slender drooping stem, bearing out 4—5 flowers of a bright rich rose colour near its apex. Lodd. (N. 752). — Van Houthe Fl. S. II. Fasc. 5. tab. 6.

2. **COMPARETTIA COCCINEA** Lindl. Bot. Reg. XXIV. (1838.) 68:

Foliis angustis, coriaceis apice obliquis acutis, sepalo antico acuto calcar falcato duplo brevior, labello obcordato subrepando basi bilamellato calcaribus subulatis ciliatis, columna medio sub stigmatate elevata.

This beautiful and very rare epiphyte flowered with Loddiges and is said to be a native of Brazil; it however agrees so entirely with dried specimens collected near Xalapa and now before me, that some mistake is to be suspected in its reputed country.

Perigonium flavo rubrum, labellum scarlatinum; folia subtus violacea.

Comparettia consists at present of this and two other species inhabiting Peru. Of these *C. falcata* approaches the present subject in many respects. It, however, appears to differ in having broader leaves, larger flowers, no elevated plate at the base of the stigma and the spurs of the lip smooth. Struct. of labellum and sepals as in *Aconitum*.

1454 b. **SCELOCHILUS** Klotzsch.

Allg. Gtz. 1841. 14. Aug. — Inde: Lindl. Bot. Reg. XXXVIII. (1842.) Misc. 23.

Perigonii conniv. foliola exteriora conniventia, carinata, basi leviter coalita, lateralia labello supposita, usque ad apicem connata, ad basin in calcar obtusum producta; interiora exteriori, postico aequalia. Labellum integrum, inferne attenuatum basi bifidum, infra basin columna obsolete continuum, ad marginem infra medium bicornis, disco calloso, puberulo, antice bidentato, dentibus obtusis conniventibus. Columna semiteres, apice submarginata. Anthera unilocularis. Pollinia 2, solida, sphaerica.

Herba caracasana, epiphyta; rhizomate caespitoso, pseudobulbis subnullis; foliis solitariis, coriaceis, carinatis, basi vaginis squamaeformibus, conduplicatis involucreatis; racemo radicali; floribus compressis navidis.

1. **SCELOCHILUS OTTONIS** Klotzsch Allg. Gärtentz. 1841. Aug. 14. Lindl. l. c.:

Foliis oblongis coriaceis, laete-viridibus margine acutis, subundulatis, apice conduplicato-acutissimis, recurvis; racemo radicali, subramoso,

folio parum longiore; foliis perigonii interioribus oblongis, obtusis, intus purpureo-striatis sparsimve pubescentibus.

Flower spike a little branched, slightly longer than the leaf, round, threadlike, smooth, and covered by sessile, dry, membranous lanceolate and acuminate bracts. Flowers short-stalked, yellow, compressed, 7" long. The column is without colour, twice as short as the floral envelopes. Introduced 1840 by Mr. Edward Otto. He discovered it on his journey upon the Silla of Caracas, where he found it 5600 feet above the level of the sea, in thick woods on the trunks of trees. Fl. Maj. — Lk. Kl. Otto II. (1842.) tab. 31. Rchb. fil. Bonpl. II. 14. Caracas. Wagerer!

2. SCELOCHILUS STENOCHILUS Rchb. fil. Mss. Huc: *Rodriguezia stenochila* Lindl. Orch. Lind. 1846. p. 23:

Foliis oblongis planis, racemo laxo erecto, paucifloro, floribus divaricatis, sepalo inferiore bilobo obtuso calcarato, labello angustissimo apice hastato basi sagittato, columna aptera.

„An epiphyte from the forests of Jaji. Flowers pale yellow, streaked with red. Venezuela, at the height of 6000'. July 1842." N. 659. Of this species I have only a leaf and a couple of loose scapes; the latter are about 3 inches long, with 2—3 sharp keeled distant sheaths, and 4 flowers, about the size of those of *R. secunda*. The very narrow lip and thick lumpish column are quite peculiar.

Scelochilus Lindeni Lindl. Paxt. Fl. G. III. p. 88.

Obs. Moneo tamen, me ex horto Lindeniano tenere iconem pictam „*Rodrigueziae stenochilae*“, quae certe refert *Scel. Ottonis*. Rchb. fil.

3. SCELOCHILUS JAMIESONI Lindl. Paxt. Fl. G. III. 88. sub 55:

Foliis oblongo lanceolatis acuminatissimis pergamenis, scapo brevioribus, racemo brevi ancipiti, bracteis setaceo acuminatis pedicellis longioribus, sepalis lateralibus semiconnatis acuminatis, calcare inflato rotundato, petalis lanceolatis, labello obovato concavo apiculato basi calcare brevi didymo, brachiis 2 incurvis pone basin.

Quito. Dr. Jamieson 1848. — The form of the lip cannot be determined from the examination of the only flower at our disposition. It seems to be naked.

4. SCELOCHILUS SACCATUS Rchb. fil. Mss.:

Pseudobulbis angusto ligulatis pollicaribus, a squama oblonga acuminata fulvis, foliis cuneato oblongolanceolatis acuminatis, pedunculis paucivaginatibus apice racemosis, bracteis lanceis acuminatis ovaria pedicellata subaequantibus, floribus illos praecedentium aequantibus, sepalo dorsali ligulato lanceolato acuto, sepalo inferiori subaequali acuto bifido, basi in saccum subsphaericooblongum inflato, tepalis cuneato oblongis acutis, labelli basi ima bicalcarati ungue elongato, lamina flabellata obtusata, aequilonga, falculis extrorsis duabus in limitibus unguis ac laminae. gibberibus divergentibus duobus in lamina; columna gracilentia paulo breviori, medio angulata. *Comparettia saccata* Pöpp. Endl. I. tb. 72.

Me iudice jam ipso sacco et falculis medianis a praecedentibus bene diversa. Peruvia subandina supra arbores. Cuchero Febr. 1830. Pöppig! (Juxta typos!)

1454/2. **QUEKETTIA** Lindl.

Bot. Reg. XXV. (1839.) Misc. 6.

Perianthium cylindraceum, sepalis linearibus aequalibus basi gibbosis, lateralibus connatis, petalis linearibus aequilongis. Labellum oblongum, integrum, muticum, cum labello parallelum, basi excavatum bicallosum.

Columna semiteres, erecta, apice utrinque auriculata. Anthera unilocularis. Pollinia 2, postice excavata; caudicula lineari, glandula minuta.

Lindl. Fol. 1 Oct. 14. 1852: A singular little plant, with the habit of a *Pleurothallis*; is nearly related to *Ionopsis*, but is different in habit, and is essentially distinguished by its lip being not only parallel with the column throughout its whole length, but excavated at the base, and furnished there with two callosities like those of *Spiranthes*. Its column is, moreover, long and narrow, and has two long membranous recurved ears hanging down from the apex. The lip has no trace of the auricles and calli of *Ionopsis*, nor are the lateral sepals united into a pouch; they are, however, slightly joined at the base, and gibbous there.

1. *QUEKETTIA MICROSCOPICA* Lindl. B. Reg. 1. c. :

Folia teretia maculosa. Panicula capillaris, tripollicaris. Flores parvi, flavi. Sepala linearia obtusa et labellum oblongum acutum cellularum majorum lutearum in medio raphidaphororum copia repleta. Columna linearis, petalorum fere longitudine auriculis acutis inflexis.

It gives me great pleasure to name this curious plant after Edwin J. Quekett Esq. F. L. S. an excellent Botanical observer, and one of our most skillful anatomists. I am already indebted to that gentleman for some valuable facts concerning raphides; a plant therefore in which these crystals form a conspicuous part of the structure may not be inappropriately selected to bear his name.

A very singular little plant, with the habit of *Pleurothallis*, pollenmasses of a Van-deous O., more allied to *Rodriguezia*, than to any thing else, but quite different in habit and essentially distinguished by its cylindrical perianth, and labellum not only parallel with the auriculate column throughout its whole length, but excavated at the base and furnished there with 2 callosities like those of *Spiranthes*. Its leaves are terete, subulate, about 3" long, and beautifully mottled with light green, and purple, 5" high. Fabric of leaves below the epidermis! Flowers abound in raphides clustered in cells larger than those, which surround them, and of a different colour, so that the flower, when examined with low powers of the microscope looks as if it were dotted. I have observed this in *Liparis pendula* (Bot. Reg. 1838. Misc. 128) and in *Bolbophyllum fuscum* (XXV. 1339. Misc. 5.) and it will probably be found a common structure in the sepals and petals of O. as we already know it is in their leaves and stems. This caudicula is excellently adapted to show the cellular nat. of that part and to explain upon what plan it is formed in other cases.

Lindl. Fol. 1. c. : Wild in Brazil. Loddiges. (v. v. c.). Leaves terete, subulate, about three inches long, mottled with light green, deep green, and purple. Panicle about three inches long, with a few capillary arms, and minute ovate acute membranous bracts. Flowers nearly sessile, cylindrical, two-tenths of an inch long, white. Sepals linear acute; the laterals very slightly united and gibbous at the base. Petals of the same length and form. Lip parallel with the column, oblong, rather narrowed to the base, membranous, at the base itself hollowed out, downy on the anterior edge, and furnished at the foot of the column with a pair of callosities. Column linear, erect, with a pair of falcate obtuse ears curved downwards from either side of the stigma, which is a mere transverse cleft.

1455. **RODRIGUEZIA** R. Pav.

Fl. Peruv. Prodr. 115. t. 25.

(In L. O. 194. infauste cum Gomezia R. Br. commixta).

Burlingtonia Lindl. Bot. Reg. XXIII. (1837.) 4927:

Perianthium membranaceum, convolutum, obliquum. Sepala unguiculata, labello breviora, basi a petalis distincta; lateralia basi concava,

connata, labello supposita. Petala unguiculata, labello parallela, sepalis longitudine aequalia, sed latiora. Labellum unguiculatum, bilobum, basi cornutum aut muticum, cum columna parallelum, apice dilatatum; ungue canaliculato, lamellato. Columna teres, longe clavata, nunc apice appendicibus duabus, coloratis aucta; clinandrio dorsali, stigmatibus utrinque cornuto. Anthera unilocularis. Pollinia 2, postice excavata, caudiculae subulatae elasticae adnata. — Herbae epiphytae, pseudobulbis 1—2phyllis, basi foliatis.

Those, who have the honour to be acquainted with the Countess of Burlington will feel, that no compliment was ever more justly conveyed, than in the dedication of those most lovely flowers to the amiable and accomplished Lady, whose name they are herewith to bear.

In many respects it agrees with the genus *Rodriguezia*, especially in its lower sepals being united in one, in its lip having a short horn at the base, in the column being taper, and in the structure of the pollenmasses; and I was first disposed to refer it thither; but its membranous and convolute (not herbaceous or coloured and spreading) flowers, its unguiculate (not sessile) petals and sepals, its long slender (not dwarf) column, and its membranous 2lobed lip, so much longer, than the other parts, have satisfied me, that it is a truly distinct genus.

Rchb. fl. in v. Schl. Bot. Z. 771:

Perigonium carnosomembranaceum, subpellucidum. Phylla superiora subaequalia, lateralia interna latiora, infima coalita, vulgo apice bifida, naviculari-excavata, basi saccato-descendentia ab origine. Labellum ima basi cum gynostemio connatum, cum illo parallelum, sessile, inferne in calcar solidum productum, subconnivens, in phylla externa infima incumbens; a basi angustiori antice obcordato-dilatatum; venae centrales cristigeræ. Gynostemium teretiusculum, gracile, apice clavatum, utrinque in brachia ascendens carnosum, alaeformia, vulgo antice producta et sub angulis androclinii, et sub fovea stigmatica. Androclinium ellipticum, triangulum, margine postico et utroque angulo angulatum, anguli nunc auriculati producti, nunc abbreviati; fundo excavatum. Rostellum ascendens, triangulum, apice bidentatum. Stigma in fovea inter rostellum et brachia illa absconditum. Anthera oblongo-mitrata, dorso medio vulgo elevatulo, tumido, intus linea transversa dimidiata in partem polliniferam et caudiculigeram, linea cruciante loculorum confinia indigitante. Pollinia 2 globosa, seu oblongo-globosa, basi excisa fissa. Caudicula linearis, basi dilatata. Glandula oblonga, rostelli ventri appressa.

Rchb. fl. l. c. 770: De Gomezia R. Br. falso *Rodriguezia* substituta et R. „Burlingtonia“ inde false nominata.

1. RODRIGUEZIA SECUNDA H. B. Kth. N. G. et Sp. I. Tab. 92. — B. R. 930. — B. M. 3524. — *Pleurothallis? coccinea* Hook. Ex. 129. — *Rodr. lanceolata* B. Cab. 676. —

2. RODRIGUEZIA CARNEA Lindl. B. R. XXIX. (1843.) Misc. 113.

Pseudobulbis compressis ovalibus, foliis lanceolatis canaliculatis acutis, racemo secundo folio brevior ascendente, sepalo supremo fornicato, inferiore bidentato, petalis ovatis, obtusis, labello juxta basin aurito disco interrupte bitamellato apice cuneato emarginato, columna elongata basi lanata.

Columbia. Linden 1842. very like a small pale specimen of *R. secunda*; but it differs in having but 2 raising plates on the bend of the labellum and in its column being unusually long and woolly. Spec. Rev. J. Clowes. The foliage much the same as that of *Rodriguezia secunda*, but narrower.

3. RODRIGUEZIA STANGEANA Rchb. fl. in Otto Hamb. Gtz. 1857. p. 314.

4. RODRIGUEZIA MACULATA Rehb. fl. in v. Schl. Bot. Ztg. 1852. 771. Huc: *Burlingtonia maculata* Lindl. Bot. Reg. XXV. (1839). 44:

Racemis pendulis, sepalo anteriore emarginato; supremo sepalisque ovato-oblongis undulatis acutis, lamellis labelli cristatis dentatis, labello bilobo undulato denticulato versus unguem lacero, foliis lineari-lanceolatis.

Pseudobulbi ovales compressi monophylli basi aphylli; foliis lineari-lanceolatis striatis rectis. Pedunculi penduli, racemosi, foliorum longitudine; bracteis ovario dimidio brevioribus. Flores odorati, lutei, cinnamomeo colore, maculati, in genere parvi; labellum caeteris longius, basi album, lamellis 3 inaequaliter dentatis carnosis parallelis antice abrupte truncatis. Columna ungue labelli brevior eique appressa, clavata, semiteres, apice utrinque bicornis sanguinea. Brazil. Loddiges 38.

7. RODRIGUEZIA RIGIDA Rehb. fl. in v. Mohl und v. Schl. B. Z. 1852. 771: *Burlingtonia rigida* Lindl. Bot. Reg. XXIII. (1837.) sub 1927:

Caulibus teretibus rigidis durissimis, erectis, per longa intervalla proliferis, pseudobulbis obovatis compressis monophyllis, foliis oblongis, scapo longo rigido apice racemoso, labello basi mutico disco sparse lamellato, columna pubescente appendicibus 2 falcatis erectis pilosis aurita.

Found in Brazil, near Villa Nova de Almada, by Prince Maximilian of Wied Neuwied and preserved in the Brazil. Herbarium of Dr. v. Martius. This singular plant has stiff, apparently erect stems, the thickness of a crow's quill, which throw out pseudobulbs at intervals of from 1½ to 2 feet; each pseudobulb pushes forth its own roots, which are extremely long and as fine as hairs; and gives birth to a scape of the same thickness and texture as the main stem, a foot and half long, at the tip of

which are clustered 5 - 6 flowers, the size of those of *Burlingtonia nivea* with the perfume of violets.

Hook. Lond. Journ. 1842. p. 189: On *Crescentia Cujete* at Rio Camprido. Septbr. Lindl. Sert. N. 36.:

Caule erecto ramoso tereti distanter sobolifero, foliis ovato lanceolatis acutis, racemo simplici nutante, bracteis oblongis acuminatis, labelli bilobi lobis approximatis.

Rio Janeiro. 125. Gardner. Tufts of 2-3 leaves, ovato lanceolate, rigid, petiole is thin, folded together in an equitant manner, articulated with the lamina. In the middle of these leaves appear a short branch in form of a pseudobulb, oval, thin and furrowed, on whose apex arise one or occasionally 2 leaves, like the first in form, but without the equitant petiole. The plant having advanced to this point and succeeded in establishing itself on the branch of a tree by means of numerous fine rather stiff roots, it next produces, from the axil of one of the lower leaves a rigid stem, slender and as thick as a crow's quill, which rises erect into the air forming 2-3 membranous sheaths upon its surface; and ceasing to grow as soon as it has 8-10". At its apex it develops just such a tuft of leaves as that from which it sprang; and thus the plant continues to live till the period of flowering has arrived. It emits from the axils of one of its lower leaves a flowering stem or scape, 6-8" long, having few distant membranous scales bearing at the apex a very short umbel-like raceme of several large white flowers delicately tinged with pink. Bracts ovate, acuminate, membranous, rather longer than the pedicels. Sepals shorter than petals, uppermost oblong, acute, pressed close to the back of the petals, lowermost are united into a single piece, corresponding in form with the upper, slightly split at the point, pressed close up to the lip, and extended at the base into a short spur, which is notched at the point. — Petals oblong, wavy, parallel with the column and lip, rounded and spreading at the point. Lip longer than the petals, broadly obovate, 2 lobed, wavy, narrower at the base into a stalk, which is introduced within the spur formed by the 2 lower sepals; near its base it has 4 short wavy elevated plates placed in unequal pairs, on each side of two slightly elevated lines. Column is parallel with the base of the lip, clubshaped, tapering and hairy, much shorter than the petals, at the upper end on each side stands along membranous narrow ears guarded in front by a curved tooth of considerable size. Within these teeth is stationed a glutinous circular excavation, which is the stigma. The anther is rounded, uncrested, abruptly cut off in front. Pollenmasses two, excavated at the back, and placed upon a long obovate strap or caudicula, attached to a small oval gland. Column deprived of all parts is alike a bat's head and neck. Brazil. Travellers report it to have a delicious scent of violets. I did not perceive it.

8. RODRIGUEZIA OBTUSIFOLIA Rehb. fl. l. c. Huc: *Burlingtonia obtusifolia* Lindl. Sert. (1840.) sub 36:

Caule erecto ramoso tereti distanter sobolifero, foliis oblongis obtusiusculis, racemo subpaniculato nutante, bracteis subulatis, labelli bilobi lobis distantibus rotundatis. Aff. *B. rigida*.

Organ Mountains. Gardner 664. Leaves smaller, narrower, obtuse, flowers smaller, inflorescence slightly paniced. — Lindl. in Paxt. Fl. G. J. 99. N. 569: It is in reality very near *B. rigida*, from which it only differs in the ears being blunter and longer, the leaves smaller, narrower, more blunt, tapering to the base, the flowers smaller and the lateral lobes of the lip much narrower. In this plant, *B. decora*, however we have according to the authors above quoted, much smaller flowers, a simple conical, not twolobed spur, short very sharp sepals and petals and a pair of great lacerated appendages at the base of the lip, to say nothing of the spotting, which is so much unlike anything known among the *Burlingtonias* except *maculata*.

9. RODRIGUEZIA BATEMANI Pöpp. Endl. N. G. Sp. Vol. I. t. 70. Huc: *Burlingtonia rubescens* Lindl. Bot. Reg. XXIII. (1837.) sub 1927:

Racemis erectis, sepalo anteriore integerrimo lineari-lanceolato patente supremoque acuminatis, labello basi auriculato bilamellato.

Delicately spotted with rose colour. Inhabits the trunks of the Calabash trees in the mission of Yurimagnas, in the province of Maynas, the hottest part of Peru, and is loaded with blossoms all the year long. Peru. Pöppig.

10. RODRIGUEZIA FRAGRANS Rehb. fl. l. c. Huc: *Burlingtonia fragrans* Bot. Reg. XXIII. (1837.) sub 1927:

Racemis erectis, sepalo anteriore integerrimo, supremo acuto, labello postico cucullato supra unguem bilamellato, disco pubescente elevato apice tridentato.

Seated upon the highest branches of Cedrela tree perfumes the forests of the same country with the odour of Jonquils. Brazil in the districts of Morro-Quemado and Macahé, and in the neighbourhood of the town of Boru Jesu de Bananal; Descourtilz drawings Nr. 12.

Lindl. Sert. 11. (1838): Column taper club-shaped upwards, prolonged on each side of the stigma into a short flat horn, white, about half as long as the lip, with 2 short purple conical ears on a level with the apex of the anther. Anther slopes backwards upon the end of the column, is hemispherical and divided into two cells by a perpendicular partition; at the apex it is dilated and hollowed out to secure an oval yellowish gland, to which adheres a curved strap having 2 deep yellow pollen-masses. — (Comparata ibi cum *R. venusta*). Leaves more obtuse, raceme of flowers erect, labellum standing at the back, and the little ears at the end of the column almost obliterated. Epidd. parduriforme Desc.

11. RODRIGUEZIA PUBESCENS Rehb. fl. l. c. Huc: *Burlingtonia pubescens* Lindl. Cf. Walp. Ann. III 554 Praeterea l. c. Lindleyano: Snow white. Appears to be very rare at Pernambuco. Flowers erect. — *Burlingtonia pubescens*: downy column; lip with 3 yellow ridges on each side near the base, a pair of erect side lobes, rendering it what is technically called hastate. Small flowers.

12. RODRIGUEZIA BAHIENSIS Rehb. fl. Bonpl. II. p. 90:

Aff. quoad florem *R. secundae*, qua paulo major; dentibus labelli parvis posticis, lobo medio ab ungue anguste cuneato quadrato bilobo, lamellis 2 per unguem, 2 mediis anterioribus; flore candidissimo, callis et macula utrinque in angulis gynostemii aurantiacis.

Sepalum summum oblongum acutum, infimum excavatum oblongum acutum; tepala oblonga acuta; labellum ima basi infra valde corniculatum, linearilgatum, antice in laminam quadratam sensim dilatatum, apice bilobum, latera minute crenulata, auriculæ angulatae utrinque pone basin: lamellae 4 erectae xanthinae ab auriculis in discum lobi medii, externae quidem abbreviate, internae antrorsum progredientes; gynostemium gracile, glabrum, brachia deflexa, denticuli minutissimi inter brachia sub fovea, callus maximus semirotondus in androclinio. Bahia, eingeführt von Herrn Senator Jenisch, cultivirt von Herrn Kramer.

13. RODRIGUEZIA VENUSTA Rehb. fl. l. c. Huc: *Burlingtonia venusta* Lindl. Bot. Reg. XXIII. (1837.) sub 1927:

Racemis pendulis, sepalo anteriore integerrimo, supremo acuto, labello infra medium transverse plicato.

One of the *Burlingtonias*, *B. venusta*, may be literally said to sink beneath its long heavy clusters of snow-white blossoms, just tinged with pink.

Brazil.-Descourtilz drawings N. 83. — Lindl. Sert. Tab. 12: Column with two short conical purple ears on a level with the apex of the anther.

var. *ionoleuca* Rehb. fl. Bonpl. III. 215:

Valde similis *R. venustae* (Burlingtoniae *venustae* Lindl.), major, gynostemio crasso breviori bene puberulo, staminodiis rhombeis antice erosulis, labello antice sinu lato bilobo, sepalo inferiori bidentato.

Racemus pendulus decemflorus. Sepalum summum lanceolatum acutum; sepalum inferius naviculare, postice saccato refractum, apice bidentatum. Tepala cuneato oblonga acuta. Labellum sub basi bene cornutum, a basi cuneata panduratum, lobi postici trianguli, antici extrorse rhombi denticulato sinu magno interjecto cum denticulo in fundo; lamellae 2 parallelae per discum, lamellis seriatis parvulis decrescentibus utrinque in basi. — Blüten weiss: äussere Hüllblätter und Fruchtknoten hell violett angelaufen. Drei sehr genäherte orangefarbige Streifen auf der Lippe vor den zwei Leisten, welche selbst ebenso gefärbt sind. Die übrigen Leistchen hell violett. Diese Pflanze erscheint hier und da als *Burlingtonia fragrans* in Gärten. Die *Rodriguezia fragrans* Rehb. fl. (*Burlingtonia fragrans* Lindl.) ist durch behaarte, vorn dreizählige erhabene Lippenleiste und aufrechte Blüthentrauben unterschieden. Wir sahen sie nie. Letzter Charakter ist nicht viel werth. Das letzterhaltene Exemplar stammt aus dem Garten des Herrn Pescatore. Cultur des Herrn Lüdde mann.

Lindl. Paxt. Fl. G. I. 158: *Burlingtonia venusta*: smooth column, lip not hastate, with many shallow ridges on each side near the base. Flowers larger than in *B. pubescens*, more loosely arranged.

14. RODRIGUEZIA CANDIDA Bat. in litt. Bot. Reg. XXIII. (1837). 1927. *Burlingtonia candida* Lindl. l. c.:

Racemis pendulis, sepalo anteriore bilobo, supremo petalisque obtusis, labello seriebus duabus lamellarum carnosarum in disco.

Rodriguezia candida Batem. in litt.

Folia oblonga, apicem versus paulo latiora, subcanaliculata, solitaria. Racemus pendulus, quinqueflorus. Flores candidi membranacei, semidiaphani, venis quibusdam luteis in labello, duos pollices longi. Sepalum supremum obovatum, planum, emarginatum, inferius canaliculatum, bifidum, basi concavum, ad calcar incurvum labelli recipiendum, a petalis distinctum. Petala obovata, apice patula, circa columnam voluta. Labellum cum columna parallelum, ungue canaliculato, apice utrinque unidentato, apice dilatatum subcuneatum, bilobum, venis lutescentibus ornatum; lamellis pluribus distichis carnosis in disco, quarum anteriores multo longiores. Columna gracilis, teres, clavata, apice dentibus duobus carnosis stigmati adstantibus, clinandrio declivi immarginato.

Lindl. Paxt. Fl. G. I. p. 158. *Burlingtonia candida* has a smooth column; lip very slightly hastate, a stalk two thirds as long as column, and one ridge on each side, forming a broken row of callosities. Flowers much fewer in each bunch, twice as large as in *B. venusta*.

15. RODRIGUEZIA LANCEOLATA R. Pav. Fl. Peruv. Prodr. 219. Rehb. fl. in Bonplandia IV. 213.

16. RODRIGUEZIA ENSIFOLIA R. Pav. Fl. Peruv. Prodr. 218. Rehb. fl. in Bonplandia IV. l. c.

17. RODRIGUEZIA GRANADENSIS Rehb. fl. l. c. *Burlingtonia granadensis* Lindl. Orch. Lind. 1846. p. 24:

Foliis oblongis acutis, racemo erecto(?) 5-floro, bracteis minimis, apiculatis, labello bilobo subrhombico trilamellato basi unidentato, columnae alis 2 erectis laceris, 2 latis truncatis porrectis duplo majoribus.

„Leaves fleshy; flowers white, or in a variety yellowish. An epiphyte on *Psidium*s, between China cota and Chopo, in the prov. of Pamplona, at the height of 2500.

April." (N. 1260.) A finer species with flowers $1\frac{1}{2}$ " long. The lower sepal is bent backwards, so as to resemble a pendulous boatshaped process.

Rchb. fil. Bonpl. III. 66. Ocanna. 5000'. März. Wagener.

18. RODRIGUEZIA REFRACTA Rchb. fil. l. c. *Burlingtonia refracta* Lindl. Garden. Chronicle 1853. 22. Oct. 679b.:

Sepalo anteriore integerrimo acuminato refracto calcar depressum spatulatum involvente, petalis obovatis apiculatis apice recurvis, labello apice semicirculari emarginato medio constricto infra medium undulato, lamella duplici carnosae plana in discum lineisque 2 elevatis utrinque, columnae glabrae alis calvis 2 linearibus erectis, 2 oblongis dimidiatis porrectis.

Stemless. No beauty. Recurved 5—7 flowered racemes, shorter than the solitary oblong leaves. The scentless flowers are dirty white, a little stained with purple, about as large as in *B. candida*. The double front sepal, instead of curving upwards beneath the lip, is directed backwards, and entirely envelops a long narrow depressed spur. The small wings of the column are sometimes longer, sometimes shorter, than the anther, the front of which is blunt and hooked downwards. The elevations of the lip are spotted with dull red. We received a live specimen from Mr. Skinner. Dried specimens: Santa Martha Purdie.

Dubia.

Burlingtonia nivea Lindl. B. R. 1927. (lin. penult. descr. *Burlingtoniae rigidae*) calami lapsu pro candida? Certe.

1457. **MACRADENIA** RBr.

Bot. Reg. 612. (1822).

1. **MACRADENIA LUTESCENS** RBr. l. c.

2. **MACRADENIA TRIANDRA** Lindl. Bot. Reg. XXI. (1836.) 1815:

Foliis coriaceis lineari-oblongis acuminatis, racemo prostrato, labello in medio trilamellato, clinandrio serrato, antheris duabus sterilibus.

Pseudobulbi cylindranei paulo attenuati. Folia plurivenia. Racemi foliis multo breviores. Sepala et petala intus sanguinea herbaceo limbata. Labelli lamellae rotundatae, costaeformes, antrorsae, crassiores. Antherae steriles ovaes, integrae, sanguineo marginatae.

Obs. Forsan huc pertinet: *Rhynchadenia* A. Rich. in Ramon de Sagra Cub. 248.

Sepala externa libera, subapproximata, aequalia, supremo concavo, omnia apice apiculata; interna (petala) subsimilia, paulo angustiora, aequilonga; labellum basi cum gynostemio continuum nec articulatum, parallelum, semicanaliculatum, sensim ampliatum, apice truncatum, hinc et illic obtusum, ligulatum, ligula abrupta linearis acuta, trinervia, revoluta. Gynostemium elongatum, arcuatum, margine apiceque alatum; ala terminalis ampla, inaequaliter dissecto denticulata; rostellum elongatum angustum, glandula oblonga elliptica terminatum; pollinia 2 integra in caudicula tenui membranacea, postice lata, sensim attenuata et longe angustata lineari insidentia; glandula terminali.

Herbae epiphytae. Pseudobulbi parvuli ovoideo oblongi longe attenuati, apice monophylli; scapus radicalis 1—3 florus.

Rhynchadenia cubensis A. Rich. Tab. 85:

Foliis elliptico lanceolatis acutis submembranaceis, basi articulatis; scapo radicali folio breviori, 1—3floro, simpliciter aut bifido; floribus parvulis pallide purpureis.

Cuba.

Obs. El genero que denominamos Rynchadenia, [ocupa un lugar medio entre los generos Ornithidium y Ornithorhynchus *). Difiere del primero por un gynosteme concavo en el vertice y cuyos bordes estan dislacerados, por su largo rostellum, por sus dos masas polinicas sentadas sobre una caudicula muy larga, adelgazada en punta y rembiendo el rostellum, terminada por una glandula peltada. Difiere del segundo, por su gynosteme elargado, sus dos masas polinicas solamente y no cuatro; dispuestas en cruz y sobre todo par su porte.

3. MACRADENIA SURINAMENSIS Rehb. fil. Wullschl. Mss.:

Labello trifido, laciniis lateralibus semiovatis, lacinia media porrecta cuneato lancea acuminata, carinis ternis approximatis per discum inter lacinias laterales, androclinii cucullo prono antice tantum aperto, lobulato, nullibi serrato.

Vaginae fulventis scariosae brunneo tinctae. Pseudobulbus ligulatus ultra pollicaris. Folium cuneato ligulatum acutum. Pedunculus ex vaginae fulventis supremae axilla internodio infimo crasso, reliquis tenuibus, vix bipollicaris, bivaginat, apice subfractiflexus. Bracteae ligulatae acutae ovariis pedicellatis triplo breviores. Sepalum dorsale cuneato oblongum acutum fornicatum. Sepala lateralia oblonga acuta labello supposita. Tepala paulo minora, breviora. Labellum descriptum. Omnia sicca brunneo cinnamomea venis obscurioribus. Columna clavata. Para. Wullschlaegel.

4. MACRADENIA LOXOGLOTTIS Focke et Rehb. fil.:

Labello trifido, laciniis lateralibus semiovatis apice abruptis seu obtusangulis, lacinia antica a basi lata ligulata acuta obliqua, carina unica medio angulata per discum inter lacinias, androclinii cucullo erectiusculo serrulato, angulo (staminodio?) rotundato utrinque supposito.

Pseudobulbus ligulatus pollicem longus. Folium lanceolatum acutum. Pedunculus erectus, violaceus, paucisquamatus apice oliganthus racemosus. Sepala et tepala lancea acuta flava, serie macularum cinnamomearum contiguarum per lineam mediam. Labellum album, guttulis quibusdam ac carina purpureis. Columna alba, apice viridis, violacea limbata. Surinami. Paramaribo 2. Mart. 1843. (Hab. sp. sicca).

5. MACRADENIA BRASAVOLAE Rehb. fil. Huc: *Macradenia?* *Brasavolae* Rehb. fil. in v. Schl. Bot. Ztg. 1852, 751:

Perigonii hyalino-membranacei phyllis lanceolatis acuminatis subaequalibus, labello trilobo, basi cuneato, lobis lateralibus rotundatis, abbreviatis, lobo medio cuspidato (Aulizei more!) elongato, androclinii alis marginantibus membranaceis denticulatis, processu rostellari lanceo.

Trugknollen schlank, länglich, zusammengedrückt. Blatt länglich, spitz. Aehre aus der Achsel der einen der grossen dürrhäutigen Schuppen, vielblüthig. Deckblätter häutig, lanzettlich, zugespitzt. Blüten so gross, wie die der *Macradenia triandra*, nur die Spitzen viel länger ausgezogen. Ich fand je 2 Pollinia auf dem *Androclinium*, allein die Caudiculae waren abgefallen. Da ich diese Organe nicht studiren konnte, setze ich das Fragezeichen. — Guatemala.

1458. **CRYPTARRHENA** RBr.

Bot. Reg. t. 153. (1816).

Rehb. fil. in v. Mohl und v. Schl. Bot. Ztg. 1852, 765: :

Perigonii phylla quinque lanceolata subaequalia. Labellum ancipituinguiculatum, dorso angulate carinatum, antice in laminam quadrifidam divisum, basi cum gynostemio connatum sub angulo acuto. Gynoste-

*) Ingenti lapsu calami pro Ornithocephalo! Ornithorrhynchus probum est animal maniferum australasicum anatis rostro calcaribusque maris insigne.

mium semiteres, rostellum cucullatum, lanceum, antrorsum ascendens, androclinium postice ascendens, alato-marginatum, denticulatum. Anthera unilocularis, prona. Pollinia oblonga, excavatula, per paria lateralia (!!) in caudicula lineari basi glandulam oblongam, apice (in fundo androclini) appendices geminas unguiculatas apice obtuse rhombeas gerente!! Epiphyta Vandea, vultu Notyliae, sed epseudobulbis. Racemi pluriflori axillares.

L. c. p. 766: Säule denen von *Macradenia* vergleichbar, Lippenanheftung und besonders Pollinarium einzig in ihrer Art, Lippenplatte der Lippe mancher *Oberonia* vergleichbar. — Die Gattung steht völlig isolirt, keine ist ihr auch nur verwandt. Hr. Prof. Lindley klagt mit vollem Recht über die Kürze und Unvollständigkeit der Originalbeschreibung, und hat bisher über die 1816 aufgestellte Gattung keine eigene Bemerkung veröffentlicht. Hr. A. Richard (ich besitze zum grössten Glück ein Exemplar von *Galeotti*!) hat vielleicht den unerhörten Bau des Pollinariums gesehen: „pollinia 4, per paria incumbentia, lamina anguste ascendens, glandula terminalis peltata.“ Die Gattung ist so wichtig, dass ich sie bald an einem andern Orte ausführlich beschreiben und abbilden werde: über die Lage der pollinia, ob collateralia, ob incumbentia, werde ich wohl noch mir klar werden bei Untersuchung mehrerer Blüten.

Obs. Deceptus fui ill. Richardi verbis: „glandula terminali peltata.“ Non vidit appendices apicales. Nam in icone inedita Tab. 24, cujus specimen possideo, pollinia bigemina apice depicta sunt. Nec erat credendum rem adeo difficilem indagare potuisse virum, in pollinariis indagendis adeo infaustum. Ceterum „glandula terminalis“ A. Richardi est vulgaris glandula, uti altera (pagina in „*Rhynchadeniae*“ descriptione perspicere licet.

1. CRYPTARRHENA LUNATA RBr. l. c. Rchb. fl. l. c. 766:

Foliis oblongis apice attenuatis, inaequali-tridentatis, perigonii phyllis lateralibus internis apiculatis rhombeis, marginibus anticis crenulatis, labelli lamina quadriloba, lobis lateralibus ligulatis, apicem versus crenulatis, internis trapezoideis, antice tridentatis, gynostemio valido abbreviato, processu rostellari producto.

C. lunata R. Br, Bot. Reg. 11. 153. 1813. „Jamaica.“ Ad ic. citatam descripta.

2. CRYPTARRHENA KEGELII Rchb. fl. l. c. 766:

Foliis oblongo-cuneatis, apice inaequalibus, vulgo acuto-bilobis (*Angraecorum* more), perigonii phyllis ligulatis acutis integris, labelli lamina quadriloba, lobis externis semilunato-linearibus, medianis productis obtusatis denticulatis, seu falcatis integris, gynostemii gracilis rostello longo producto. Quarta in Surinam Kegel.

3. CRYPTARRHENA PALLIDIFLORA Rchb. fl. l. c. 766:

Foliis anguste lineari-lanceolatis, basi cuneatis, simpliciter acuminatis, perigonii phyllis lateralibus internis ligulatis obtusatis apice denticulatis, labello prioris, lobis medianis tamen latioribus, brevioribus, gynostemii abbreviati validi rostello abbreviato, abscondito.

Clynhymenia A. Rich. Gal. Comptes rendus. *Orchidofunkia pallidiflora* A. Rich. et Gal. Ann. sc. nat. 1845. p. 24. Oaxaca 5298. *Galeotti*

Perianthium explanatum, labellum unguiculatum cum basi gynostemii continuum, ungue superius cristato-carinato, lamina plana trifida; gynostemium apice sensim dilatatum et in clinandrium marginatum postice productius desinens. Anthera 2-locularis, postice biloba, antice angustata et productior. Pollinia 4 per paria incumbentia, lamina an-

gusta ascendens. Glandula terminalis peltata. — *Orchidofunkia pallidiflora* Rich. Gal. tab. 24. Mexico.

1458^{1/2}. **PALUMBINA** *Rchb. fl.*
Mss. in horto Schill.

Sepalum dorsale oblongum obtuse acutum. Sepalum inferius aequale. Tepala oblonga obtuse acuta. Labellum subaequale. Columna crassa, androclinium obliquum apiculatum, rostello quinquelobulo seu praerupto medio unilobulato; alae membranaceae retusae denticulatae juxta foveam circularem. Tabula stigmatica obliqua pronaarescens super labelli basin. (Labellum igitur nec articulatum, nec vere continuum, sed accretum, uti in *Dignathi*, *Comparettia*, *Scelochilo*). Anthera depresso mitrata antice abrupte brevique triangula. Pollinia depresso pyriformia postice fissa, caudicula secundaria utrinque in fissuram ingrediente, caudiculae lineari accreta. Glandula rotunda.

1. **PALUMBINA CANDIDA** *Rchb. fil. l. c. Oncidium candidum* Lindl. Bot. Reg. XXIX. 1843. Misc. 76:

Pseudobulbis ovalibus compressis monophyllis, folio lineari-lanceolato basi canaliculato, racemo paucifloro flexuoso, sepalis oblongis lateralibus connatis, petalis majoribus patentibus planis obtusis, labello ovato oblongo plano basi linea convexa elevata transversa aucto, columnae alis rotundatis, serratis, tuberculo baseos elevato labello adnato.

Guatemala. Hartweg.

Ivory white flowers with a couple of small violet dots at the base of each petal, and the usual prominence at the base of the column, bright yellow and adnate to the lip. The flowers are 1" diam.

Lindl. Folia. I. *Oncidium* 53: O?? *candidum* Lindl. Bot. Reg. 1843. l. c.: „all the evidence I possess regarding this consists in a sketch from the live plant, made in 1843. Specimens have been lost, and the growing individual has disappeared. The flowers are about an inch in diameter, white, with a yellow crest and are described as having appeared in a fewflowered raceme. To what was said in the „B. R.“ the following should be added: sepalum dorsale oblongo lineare, erectum; lateralialia in unum breve concavum emarginatum connata. Petala ovata obtusa, sepalis multo majora. Labellum patens ovatum, obtusum, etiam majus, basi columnae per tuberculum adnatum, quod a fronte marginulo denticulato transverso circumdatur. Columna brevis, stigmatē circulari, alis cuneatis brevibus denticulatis. Pollinia 4, *geminata caudiculis 2 cuneatis glandulae circulari adnata!* If the sketch before me is accurate, it cannot be an *Oncidium*, as the words in italics show; but until the plant shall have been reexamined it is safest to leave it where it stands.

Rchb. fil. Mss.: Rhizoma validiusculum multisquamatum. Pseudobulbi ligulati anticipites, sulcati, monophylli (ex cicatricibus etiam diphylli). Foliolum cuneato ligulatum acutum, obscure viride. Pedunculus atropurpureus paucivaginatus apice racemosus, vulgo quadriflorus. Bractae squamiformes minutae. Ovaria pedicellata viridia, sepalia et tepala extus roseo violacea. Omnia intus candida, exceptae sunt striae roseo-violaceae croceae maculis atropurpureis. Magnitudo florum nunc illorum *Odontoglossi pulchelli*, nunc major.

Aurea monographia ill. Lindley in Foliis Orch. I. Oct. 17. 1818 edita, quam sequimur. Et haec habet auctor noster:

For the distinction between this well-known genus and *Odontoglossum*, the reader is referred to that article.

In some of the sections, whether artificial or natural, into which *Oncidium* is here divided, the limits of the species are clearly definable; in others it is extremely doubtful, whether some, which the author still retains ought to be admitted as anything more than forms of one common type, as for example, among the *Plurituberculata*. It will also be found, that supposed species are absolutely reduced without hesitation to an extent, which the author once thought improbable; but many months' very careful critical re-examination of all the copious materials at his command leaves no doubt upon his mind, that at least those supposed species, which are now cancelled ought never to have been elevated to that rank; he must, however, add, that the badness of materials, the imperfection of drawings and descriptions, and the misinformation so common in gardens concerning countries, have rendered such errors unavoidable, even if no account is taken of the haste with which a botanist working without leisure must necessarily act.

He would add, that in the revision of this genus his thanks are not only due to his usual correspondents, but most especially to Professor H. G. Reichenbach jun. of Leipsig, a most acute and experienced orchidologist, without whose invaluable assistance it would have been impossible to form an opinion concerning many species published by continental writers; he has also to acknowledge his special obligations to the Administration of the Museum of Natural History, Paris; to Messrs. Linden and Galeotti; to Mr. Miers; and to Sir W. J. Hooker; all whose materials have been placed in his hands without reserve.

" " 2—00, adjectis verrucis circumstantibus.	} §. 12. <i>Verrucituberculata</i> . 180—185.
basi manifeste lätius	
Labellum dilatatum membranaceum. Clinandrium lacerum vel glandulosum	§. 13. <i>Basilata</i> 186—196.
	§. 14. <i>Glanduligera</i> . 197—198.

From this arrangement, the most important part of which was first proposed in „Paxton’s Flower Garden,“ vol. i. t. 6, although certainly very artificial, there seems no good reason for departing, until much more has been learned of the genus by minute and exact examination of living specimens. Hereafter, the condition of the column and the rostellum may have more importance attached to them.

§. 1. Microchila.

Analysis of the species.

A. Auriculata.

All the species of this section have very large flowers, the prevailing tint of which is cinnamon-brown with or without a mixture of yellow. Their panicles are usually straggling or twining, sometimes reaching to a great length. Scarcely any are in cultivation, though most of them have been sent home by either Warszewicz, or Hartweg, or Mr. Linden's collectors. The tough leathery lip is an essential characteristic.

1. ONCIDIUM MACRANTHUM L. O. 205. L. F. I. c. Nr. 1. p. 4:

A magnificent species, with a climbing panicle. Flowers three inches in diameter. Sepals purplish brown, petals yellow. Lip purple, with a white crest, consisting of a central keel, with two acute reversed teeth on either side.

Wild in Central-Amerika, common; Guayaquil hb. Lambert; Peru—Matthews, 1919; at the foot of Tunguragua, 11,000 ft. above the sea—Hartweg; descent from Alausi to Jaquachi, at 7000 ft. — Jamieson, in hb. Hooker.

Lindl. in Paxt. Fl. Gard. III. 126:

Pseudobulbis ovatis, foliis oblongis obtusis, racemo volubili, sepalis cordatis oblongis obtusis undulatis unguiculatis, petalis aequalibus conformibus paulo latioribus et brevius unguiculatis, labelli hastati laciniis lateralibus subfalcatis intermediae acuminatae aequalibus, crista 3 lamellata, lamellis apice confluentibus utrinque dentibus truncatis, columnae alis rotundatis. Guayaquil.

Flowers 3—4 inches across. Sepals purplish brown, tipped with yellow. Petals bright yellow. Lip purple, with a white crest.

2. ONCIDIUM CORDATUM L. F. I. c. sub N. 2. L. Sert. I. c. p. 4:

Pseudobulbis —, foliis oblongo lanceolatis acutis coriaceis basi angustatis, scapo paniculato ramosissimo, bracteis oblongis cucullatis membranaceis obtusis, sepalis unguiculatis ovatis undulatis, petalis unguiculatis cordatis margine crispis denticulatis, labelli hastati unguiculati lobis angustis acuminatis appendicibus disci petaloideis, columna subaptera.

Peruviae rupes ad ripas fluminis prope Pangoa. Mathews 1062.

Pact. Fl. G. II. 26: A fine species, with brown flowers, whose segments appear to be bordered with yellow.

3. *ONCIDIUM HASTIFERUM* Rehb. fil. in Bonpl. Ap. 15, 1851. L. I. c. sub 3. p. 4:

O. labelli laciniis lateralibus acinaciformibus denticulatis, intermedia lanceolata acuminata, cristae dente valido acinaciformi lamella utrinque prostrata introrsa, c. alis ligulatis obliquis.

Wild in Peru, near Loxa—Warszewicz.

Near *O. macranthum*. Upper sepal ovate, wavy; laterals longer, wedged-shaped, oblong obtuse. Petals ovate, blunt, somewhat cordate, with very short broad claws. — Rehb. fil. I have a sketch of this from the author, which shows it to be distinct from all the others here enumerated. A great fleshy hooked carina rises from the middle of the lower lobe of the lip.

Rehb. fil. v. Warszewicz Bonpl. II. 102:

Aff. *macrantho* tepalis subsessilibus, labelli laciniis lateralibus lato acinaciformibus brevioribus, dente in basi lacinae mediae ancipiti acinaciformi per carinam in gynostemium abeunte, addita utrinque lamella introrsa prostrata in laciniis lateralibus, gynostemii alis ligulatis obliquis.

Sepalum summum ovatum, undulatum; unguis vix quintam longus, dimidio inferiori utrinque auriculatus, sepala lateralia paulò longius unguiculata, ipsa longiora, cuneato oblonga obtusa, paulo angustiora, basi extrorsa minute auriculata, tepala brevissima ac late unguiculata ovata obtusata basi subcordata, divaricata, labellum trifidum, lacinae laterales lato acinaciformes, latere postico extrorsum semilunato minute sinuato dentato, latere antico subrecto, lacinia media sinus triangulis prope rectis separata a basi semiovata lancea acuminata, dens validus lato acinaciformis carinaeformis in media basi lacinae mediae, addita utrinque basin anticam versus lamellula ligulata parallela basi adnata, carinula a dorso hujus dentis usque ad pedem gynostemii; lamellae prostratae, introrsum semiovatae, infra (basin externam praeter) liberae projectae in laciniis basilaribus, facie sua carinulam longitudinalem spectantes; adjecta utrinque falcula in basis lacinae mediae margine extremo; gynostemio humili acuto alis ligulatis obliquis. Loxa mit Hofmeisterella, Centropetalum, Telipogon, Trichoceros platyceros u. s. w. Plan gerade wie bei *Onc. macranthum*, nur in allen Punkten wesentlich verschieden. v. Warszewicz.

4. *ONCIDIUM TRIFURCATUM* Lindl. Ann. Nat. Hist. XXV. 384. n. 4. p. 4:

Flowers large, with yellow on the edges of the petals. Lat. sepals twice as large as dorsal. Crest consisting of three fleshy truncate ribs, of which two lie over the third. The two wings of the column are fleshy and scymetarshaped, with a pair of lancet shaped appendages projecting below them. Near *O. serratum*.

Wild in Peru—Hartweg.

Lindl. Ann. N. H. I. c.:

Sepalis lateralibus unguiculatis spathulato-obovatis planis, dorsali unguiculato rotundato crispo duplo breviora, petalis crispis dorsali minoribus, labello unguiculato tripartito, laciniis linearibus truncatis lateralibus canaliculatis crista trilamellata, columna tetraptera alis superioribus linearibus carnis apice abrupte recurvis, inferioribus rotundatis tenuioribus, clinandrii dorso in dente antherifero producto, rostello membranaceo bifido.

Peru (Hartweg).

I have only seen 3 flowers. They are 3 inches in diam.; the lateral sepals are wholecoloured, the dorsal and the petals are bordered with yellow(?). Near *O. serratum*.

5. *ONCIDIUM TRILINGUE* Lindl. Paxt. Fl. G. I. Nr. 63. II. t. 63. et l. c. sub 5. p. 4 :

A large inelegant scrambling plant. Flowers cinnamon-brown, very crisp. Crest of three dagger-shaped blades, with a few callosities in addition.

Wild in Peru; at the sources of the Marañon—Warszewicz.

Lindl. Paxt. Fl. G. cf. Walp. Ann. III. 554. addendis :

Of the crest the structure is so singular and complicated, that it is difficult to describe. In this however it is remarkable that in front of a large quasi-rock elevation there project three flat yellow tongues, which are quite peculiar. — Lem. Jard. Fl. III. 217.

6. *ONCIDIUM SERRATUM* Lindl. Sert. l. c. et F. l. c. p. 5 :

Flowers very crisp, lower sepals included, cinnamon-brown, with the upper half of the petals yellow. The crest consists of six parallel carinae, placed alternately $\frac{2}{3}$ close together. Column-wings wedge-shaped, toothletted. It has flowered in M. Pescatore's rich collection.

Wild in Peru—Mathews.

Sert. l. c. :

Pseudobulbis ovalibus diphyllis, foliis erectis rigidis acutis basi angustatis, canaliculatis, panicula pauciflora brevioribus, sepalis serratocrispatis, dorsali reniformi, lateralibus multo longioribus obovatis patentissimis, petalis ovatis acutis serrato-crispatis conniventibus, labello multo minore hastato, laciniis acutis intermedia lineari obtusa media contracta lateralibus acuminatis triplo minoribus (crista depressa crenulata), columnae alis subulatis ascendentibus. — Peru.

Found by Ruiz and Pavon, among whose drawings at Lima it was found and copied by Mr. Matthews, who sent the fig. to Sir W. Hooker. Flowers are represented of a cinnamon brown, with the tips of the petals yellow. Lateral sepals more than an inch and $\frac{1}{4}$ long; the petals measure an inch and quarter, dorsal sepals nearly $1\frac{1}{2}$ across. — Lindl. Paxt. Fl. G. l. c. : Flowered with Pescatore. Pseudobulbs oblong, smooth, terete, each having two broad sword shaped leaves at the point, and several others below the pseudobulb. Flowerstem nine feet long, partly twining, with 5 or six lateral branches, each carrying 4—6 flowers, near the extrem. Annexed fig. twice as large as in the spec. fig. in Sir Williams Herb., and 4 times as in Pescatore's collection. Cinnamon brown with bright yellow in Peruv., in the fresh plant colours of *Oncidium luridum*.

7. *ONCIDIUM FALCIPETALUM* Lindl. Orch. Linden Nr. 76. F. l. c. p. 5 :

A very fine species, with a scrambling panicle twenty feet long. Flowers more than three inches in diameter, brown. The angular base of the lip, and a cluster of sharp tubercles in front of the main ridge of the crest clearly distinguish this; the former are smaller and more numerous in Fünck's Venezuela specimen in Sir W. Hooker's herbarium, than in Linden's in my possession.

Wild in Venezuela. Fünck in hb. Hooker; forests of Merida, at the height of 5—6000 ft. — Linden, 626: Caracas at 6000 ft. — Wagerer.

Lindl. Orch. Lind. p. 14 :

Foliis lanceolatis acutis pergamenis 2—9 nerviis, floribus dense paniculatis, bracteis cymbiformibus obtusis, sepalis breve unguiculatis supremo subrotundo cordato, lateralibus ovato oblongis obtusis, petalis sessilibus brevioribus oblongis crispis complicatis falcitim recurvis, labello carnoso hastato acutissimo basi utrinque corrugato et lamellis dentatis aucto, columna laevi, alis parvis semiovatis unidentatis, clinandrio postice mucronato pubescente.

„Both epiph. and terr. from the forests of Merida at the height of 5000—6000 feet. Aug. Pseudobulbs oval, compressed, two or three inches long. Stem twenty feet

long, scrambling. Flowers very large, brown. N. 626. A noble species with flowers more than 3 inches in diameter. Leaves eighteen inches long, $1\frac{1}{2}$ wide.

Rehb. fl. in Bonpl. II. 12: Die ganze Blüthe rothbraun, Tepala und oberes Sepalum gelb berandet, Lippenwulst eben so. Scharfgepresste Exemplare Linden's sehen verschieden aus, ohne einen wesentlichen Anhalt zur Unterscheidung zu bieten. Die Größe der Deckblätter weicht etwas ab. Caracas. 6000'. Wagener.

Rehb. fl. Bonpl. II. 279. Blüten braun. Tepala mit Goldgelb eingefasst; an einander sich legend bilden dieselben einen Ring. 7000'. Ocanna. Juli. Nr. 31. Schlim.

7 bis. ONCIDIUM PAVONII, Rehb. fl. Wswz. Lindl. Folia l. c. N. 7 bis p. 5:

Of whose lip and column I am favoured with a sketch by the learned author, appears to be a variety of this. A fragment from Pavon exists in Boissier's herbarium.

8. ONCIDIUM AEMULUM Rehb. fl. in Bonpl. Ap. 15, 1854. Lindl. l. c. sub 8. p. 5:

A noble species, with dense cinnamon-brown flowers two inches and a half in diameter, arranged upon a climbing panicle, which reaches to the top of trees twenty-five or thirty feet high.—Schlim. When dried it looks like *O. macranthum*, but is quite different in the lip, which is dilated and angularly rounded at the base, linear channelled in the middle lobe, with a downy convex crest, crested in front and arching over several small round warts. One of the leaves in Schlim's specimen is almost two feet long.

Wild in Peru—Warczewicz. New-Granada in the province of Ocanna at 7500 feet.—Schlim, 413; near la Baja in Pamplona, at 10,000 ft.—Schlim, 1198. (fide Rehb.).

Rehb. fl. v. Warscwz. Bonpl. II. 102:

Aff. *O. superbienti* labello ligulato lineari basi utrinque angulato, carina basilari tricarunculata velutina, additis carinulis, gynostemii alis falcatis ascendentibus.

Paniculae rami elongati, robusti, —6flori, internodia bipollicaria, bractee chartaceae ovatae acutiusculae cymbiformes, ovaria pedicellata dimidio aequantes, sepala anguste unguiculata, sepalum dorsale ab ungue trilinari basi utrinque minute lobulato cordiforme angulis obtusatis, paulo longius quam latius, margine valde crispulum, sepala lateralia paulo longius et latius unguiculata, basi praesertim externa minute lobulata, lamina illi subaequalis, minus crispa; tepala brevis ($1\frac{1}{2}$ lin.) ac latius unguiculata, lamina oblonga acutiuscula seu acuta a basi hastata obtusangula crispa, labellum ligulato lineare acutum, basi utrinque anguste semitondo ligulato semi-ovato lobulatum, carina velutina tricarunculata a gynostemii basi usque in basin lobi medii ascendente, ibi praerupte nasuto decisa antice lateribusque pluriverruculosa, carinulae extrorsae a centro in limbum anticum loborum lateralium. Gynostemium abbreviatum incurvum, postice apice triangulo ascendens, dorso glaberrimum, basis infrastigmatica paulisper protrusa, alae juxta medium foveam assurgenti falcatae parvae nunc denticulatae. Fast eben so gross als das herrliche *Oncidium macranthum*. *Oncidium halteratum* hat sitzende Tepala; *O. superbients* ist durch die lang ausgezogene dreieckige Lippe mit 2 Seitenzähnen ohne alle Lappung gleich zu unterscheiden; ausserdem kennen wir kein beschriebenes *Oncidium* dieser Abtheilung mit ähnlichen Flügelchen. v. Warscwicz.

Rehb. fl. Bonpl. II. 273. Ocanna. 8 — 10000'. Januar 413. — Pamplona: La Baja. Nr. 1198. Schlim.

Rehb. fl. Bonpl. III. 66. Ocanna. 6000'. Wagener.

9. ONCIDIUM SUPERBIENS Rehb. fl. in Linnaea XXII. 813. L. F. p. 7:

Much like *O. halteratum*, to which I refer Schlim's 387 as it stands in my own herbarium, although Mr. Reichenbach's specimens having the same number belong to this. It differs in having the petals very much sinuated, with the upper half yellow, and the lower banded with the same colour. The crest of the lip consists of one

large blunt lobed tooth, with a wavy line on each side. The flowers appear to be deep chocolate-red, and to belong to a large showy panicle.

Wild in New-Granada—Purdie in hb. Hooker; in the province of Ocanna, at 8—9000 ft.—Schlim (fide Rehb.); Venezuela—Fünck and Schlim, 1433.

Cf. Walp. Ann. III. p. 554. Rehb. fil. Bonpl. II. 279. Ocanna: Paramos. 8—9000'. Januar. Nr. 387. Schlim.

Rehb. fil. Bonpl. III. 66. Ocanna. Wagener.

40. *ONCIDIUM HALTERATUM* Lindl. Orch. Linden, N. 75. Paxt. l. c. Rehb. III. in Bpl. March 1855. F. l. c. p. 6:

(A) *luteum*. Flowers yellow. Middle tooth of crest strong, prominent.

(B) *fuscum*. Flowers brown, with a yellow border to the petals, and lip. Middle tooth of crest short, rounded.

This differs from *O. falcipetalum* in the base of the lip being round, not angular, and in the crest consisting of one strong blunt tooth, with an uncertain number of others placed at its sides, but not in front. These are more numerous in the brown variety, than in the yellow; the former Mr. Reichenbach refers to *O. falcipetalum* (Orch. Schlim.), but the plant I possess from Mr. Linden numbered 31 is certainly this species. *O. halteratum* and *falcipetalum* are much alike, and very fine though not showy plants, with great climbing panicles of flowers three inches across. The petals are almost sessile.

Wild in New-Granada; A. in the forests of Quindiu at the height of 7800 feet. — Linden 1289; B. in the prov. of Ocanna, at the height of 7500 feet. — Schlim, 31 and 387; Warscewicz.

Rehb. fil. Bonpl. III. 66. Die nächst beschriebene Pflanze stimmt fast mit der Originalbeschreibung. — Pedunculus volubilis infra paniculatus brachycladus superne racemosus. Bracteae cymbiformes ovaria pedicellata dimidio aequantes. Sepalum summum unguiculatum cordatum obtusum undulatum basi utrinque minute quadrato auriculatum. Sepala lateralia longius unguiculata triangulo obtusata. Tepala a basi anguste ligulata brevi obtusangula triangula undulata. Labellum ligulatum angustum basi utrinque angulatum. Carina anguste rhombea lateribus lobulata ante angulos in medio, dein utrinque in basi. Gynostemium gracilentum postice angulatum in vertice; dentes erecti falcati appressi in latere; camera parvula (pro glandula?) sub rostello; fovea ovata; pars infrastigmatica utrinque obtusangula. — Hüllblätter schön kastanienbraun. Tepala auf vorderer Hälfte hellgelb (im trocknen Zustande). Ocanna. Wagener.

Lindl. O. Lind. p. 14. 1846:

Foliis ensiformibus tenuibus acutis, racemis laxis longissimis, bracteis cymbiformibus obtusis, sepalis longo unguiculatis supremo cordato subrotundo, lateralibus ovatis obtusis, petalis sessilibus ovatis undulatis obtusis brevioribus, labello carnoso lanceolato acuto subtu carinato supra crista elevata etiam carinata pubescente aucto basi utrinque dentato; columna dorso sub apice glanduloso alis linearibus retrorsum falcatis.

„Epiph. from the forests of Quindiu, in the province of Mariquita, at the height of 7800 feet. Febr. Flowers deep yellow (N. 1289). A very fine species allied to *O. undulatum* and *flexuosum*. Flowers more, than 2 inches across. Leaves thin, scarcely an inch broad.

41. *ONCIDIUM DICERATUM* Lindl. l. c. sub 11. pag. 6:

O. panicula volubili, sepalis petalisque subconformibus ovatis, labello obcordato basi dilatato rotundato, cristae callis 4 parallelis (0⁰) adjectis verruculis quibusdam utrinque a fronte, columnae alis brevibus carnosus cornutis.

None of the Auriculate Microchiles except this has an obcordate lip. The flowers are smaller than any in its section, not two inches across, apparently dark brown,

with the tip of the lip yellow. Dr. Jamieson remarks, that he has not distributed it, from which it seems to be a rare plant.

Wild in Peru; in woods near Pasto, at 10,000 feet. — Jamieson.

B. Exaurita l. c. p. 6.

There are no very large-flowered species in this group, which approaches *Odontoglossum* nearly in *O. cimiciferum*, etc. The leathery lip remains characteristic, for which reason I doubt, whether *O. scansor* can belong here.

12. ONCIDIUM VENTILABRUM Rehb. fil. et Warscewicz. Bonpl. Ap. 15. 1854! Lindl. l. c. p. 6:

This plant is very much like *O. orgyale*, and the figure of *O. undulatum* in „HBK.“; but I think they are rightly distinguished by Rehb., who has pointed out the peculiarities of the crest. In this species it consists of five erect keels, of which three are parallel, and in front of two which diverge almost at a right angle, in addition to which there are several lateral tubercles. The colours of the flower are also different. According to Warscewicz, *O. orgyale* has whole-coloured flowers with brown sepals and deep violet lip, but *O. ventilabrum* has cinnamon-brown sepals and petals, with the upper half of the latter yellow, and a deep rose-coloured lip yellow at the base.

Wild in Peru. Warscewicz.

Rehb. fil. v. Wswz. Bonpl. II. 101:

Aff. *O. undulatum* Lindl. sepalis lateralibus latioribus, labelli carinis primariis tribus in basi, lateralibus divergentibus, gynostemii auriculis minutis infrastigmaticis.

Paniculae ramuli subtenues (sc. tenuiores ac in *O. macranthum* etc., validiores, quam in *O. zebrino*), parte inferiori 1—5 vaginati, vaginae acutiusculae, ramuli superne floriferi, bractee ovatae acutae ovarii pedicellati tertiam aequantes, sepala ovata apiculata vix margine plana (ex sicco), brevius unguiculata, ungue tertiam vel dimidiam laminae aequante, basi exauriculato, lamina sepali terminalis paulo brevior, quam illae sepalorum lateralium, basi supraunguiculari nunc cordata, tepala ovata acuta, late ac brevissime (vix lineam longe) unguiculata, margine undulata, paulo breviora quam sepalum dorsale, labellum ligulatum acutum, basi utrinque integro seu bilobulo lobatum, carina anceps prona in disco, addita utrinque carinula minor aequae anceps, duaeque divergentes postice circumstantes, plurimae verruculae crassae rotundae, gynostemium cum ungue labelli connatum (more *O. refracti* Rehb. fil.), basi tenue, apice dilatatum, lobuli 2 minutissimi subtrianguli flexi in margine inferiore foveae stigmaticae. Blüten so gross, wie bei *O. falcipetalum* Lindl. Ohrchen unter der Narbe sind noch bei keiner Art dieser Abtheilung angegeben, sie kommen jedoch vor bei *O. undulatum* Lindl. (*Cyrtorchilum undulatum* Hb. B. Kth.). Wir sind fest überzeugt, dass beide Arten gut unterschieden sind, Merkmale aber sind schwer beizubringen. Zunächst hat unsere Art zweimal so grosse Blüten, die seitlichen Sepala breiter, das obere länger. Der mit dem Fuss der Säule verwachsene Lippennagel ist viel länger; die Zipfelchen stehen nach unten, bei *O. undulatum* mehr nach voru; endlich ist die Anordnung der Lippenschwielen eine sehr verschiedene, die hintenstehenden divergirenden Leisten des *O. ventilabrum* fehlen dem *O. undulatum* gänzlich. Neu-Granada. v. Warscewicz.

13. ONCIDIUM REFRACTUM Rehb. fil. Bpl. Ap. I. 1854. L. F. l. c. p. 7:

I cannot find this among Purdie's plants; but I have some flowers from Professor Reichenbach. It appears to be a distinct species, having spathaceous bracts, a loose pyramidal panicle, and undulated sepals and petals convolute at the point; reddish brown, with red bands in a dried state. The column is abruptly bent back, and united to the lip by a quarter of its length. The lip is bluntly lozenge-shaped at the base, and is extended into a strap as long as the sepals; the crest consists of an elevated keel, with depressed lamellae crenulated at the edge, two near the base

resting by their points on broader ones in front. Column slender, with minute ligulate wings, lacerated at the drooping points, and placed on the lower edge of the stigma. In the single flower I examined I only found a pair of thick deep wrinkled lamellae in the middle of the lip, which is very fleshy and convex except at the edge. The lozenge-form only appears upon flattening the base.

Wild in New-Granada. Purdie (Rchb.)

O. (C.) refractum Rchb. fil. in Bonpl. II. 12:

Pseudobulbo oblongo parvo diphylo, foliis oblongo lanceolatis acutis, panicula pyramidali diffusa, ramis ascendentibus 4—6 floris, bracteis spathaceis paleaceis acutis ovaria pedicellata tertia parte aequantibus, sepalis tepalisque undulatis, apice convolutis, sepalo summo oblongo acuto latius unguiculato, sepalis lateralibus subaequalibus, sed basi unguiculata connatis, tepalis subaequalibus quarta parte brevioribus latius unguiculatis, labello a basi obtuse rhombeo in ligulam acutam producto sepalis aequilongo, carina elevata apice libera acuta a basi ad medium, lamellis depressis extrorsum crenulatis, duabus pone basin in alteras anteriores latiores apice suo incumbentibus, gynostemio gracili tertio infimo cum labello connato, dein refracto, parte stigmatica ovali postice acuta, alis minutis ligulatis apice pendulo retuso laceris in margine inferiori portionis stigmatice dilatatae.

Trockene Blüten hellbraun mit rothen Querbinden. Ich weiss nicht, dass irgend eine Art dieser Abtheilung eine so merkwürdige Verbindung der Säule und Lippe habe. Angebahnt ist sie bei mehren *Cyrtochila* und *Basilata*, indem eine wulstige Vermittlung zwischen Lippe und Säule Statt hat, und ich betrachte diess Moment als Fingerzeig, dass ich es mit einem *Cyrtochilum* und keinem *Odontoglossum* zu thun habe. Neu-Granada. Purdie.

Rchb. fil. Bonpl. III. 66. Ocanna. Wagener.

Huc: *Odontoglossum divaricatum* Lindl. O. Lind. Nr. 89. p. Lindl. F. I. *Odontoglossum* Nr. 29. p. 11:

O. foliis oblongis coriaceis obtusis basi angustatis nitidis, panicula maxima laxa divaricata volubili, floribus (parvis) distantibus vix internodiis aequalibus, sepalis petalisque unguiculatis lineari-lanceolatis acuminatis undulatis, labello rotundato dilatato in cuspidem longum angustato basi lamellis 3 undulatis brevissimis aucto alteraque utrinque arcuata elongata, columnae alis brevibus acuminatis recurvis.

Its broad shining leaves and long straggling panicles of small flowers distinctly point out this species, which is far from a handsome one. Pseudobulbs ovate, acute, compressed at the sides. Petals yellow, spotted with brown.

Wild in Venezuela; in the province of Merida, at the height of 9000 feet; August. Linden 683.

14. *ONCIDIUM MANDIBULARE* Lind. Rchb. fil. Bonpl. Dec. 1, 1854 Lindl. F. l. c. N. 14:

A very large plant. Flowers half as large, as in *Oncidium falcipetalum*, brown and yellow. Rchb. describes the lip, etc., thus: „labello basi ovato convexo apice in ligulam longam producto, carina antice rostrata, bisulcata in disco, utrinque tuberculata, linea lunata carinata sulcis transversis quodammodo polyodonta (sed retusa — dentium incisivorum hominis instar) utrinque extrorsa ante marginem, gynostemio basi alte cum labello connato, dein refracto alis ovatis cuspidatis laceris parvis deflexis in inferiori limbo foveae transversae.“ A sketch with which Prof. Rchb. has favoured me corresponds with this. The lateral sepals are represented as linear-lanceolate, very wavy, and connate at the base; which separates the plant from any form of *O. halteratum*.

Wild in Neu-Granada. Pamplona, Pedro Alonzo, at 6000 feet. January. 1849. — Schlim, 1179. (Rchb.)

Rehb. fil. Bonpl. II. 279:

Aff. *O. refracto* sepalis lateralibus lanceolatis acutis undulatis unguibus brevibus basi connatis, labello basi ovato convexo apice in ligulam longam producto, carina antice rostrata, bisulcata in disco utrinque tuberculata, linea lunata carinata sulcis transversis quodammodo polyodonta (sed retusa — dentium incisivorum hominis instar) utrinque extrorsa ante marginem, gynostemio basi alte cum labello connato, dein refracto, alis ovalis cuspidatis laceris parvis deflexis in inferiori limbo foveae transversae.

Adest ramus inflorescentiae volubilis forsán ingentis uti concludendum ex axeos frustulo calamus cyneum crasso. Ramus paulo flexuosus. Bracteae cymbiformes acutae ovaria pedicellata dimidio aequantes. Sepala (a basi unguiculata oblongo lanceolata crispa. Tepala basi subcordata, latiora, breviora, acuta. — Blüten halb so gross, als die des *Oncidium falcipetalum*, braun, gelb eingefasst. Pamplona: Pedro Alonso. 6000'. Januar. 1849. Nr. 1179. Schlim.

15. *ONCIDIUM UNDULATUM* Lindl. Sert. Orch. sub t. 48. Rehb. fil. in Bonpl., May 1, 1854:

Cyrtorchilum undulatum HBK., l. t. 84. LO., p. 210, L. F. 7.

This is still unknown to me. It is said to have brown flowers spotted with white and yellow; a lip pink outside, yellow within, variegated with red and white spots; scape as high as a man, according to Kunth. It is near *O. orgyale* and *ventilabrum*. Mr. Reichenbach who has examined an authentic specimen, thus describes the lip the form of which is imaginary in Turpins figure. Cf. infra.

Wild in Neu-Granada; near the villages of La Ascension and Paramo de los Papas, at 6270 feet. — H. B.

Rehb. fil. Bonpl. II. 108. Flores illis *O. corynephor*i subaequales. Sepalum dorsale ellipticum apiculatum tertia infima anguste ac abrupte unguiculatum, ungue exauri, sepalis lateralibus aequo unguiculata, laminis obtusangule triangulis, tepala brevissime lateque unguiculata, triangula, basi obtusata utrinque semicordata, labello triangulo ligulatum, anguli in ima basi acutiusculi, carina depressa gyrosa per tertiam infimam, addita utrinque pone angulum carina gyrosa ante medium extrorse acuta gynostemium humile recurvum, fovea dilatata limbo producto, alis angustis linearitriangulis minutis obliquis utrinque in ima basi. Gynostemium basi sua cum ungue labelli connatum, hinc a laminae labelli basi erectum.

16. *ONCIDIUM ZEBRINUM* Rehb. fil. in Bonpl., Ap. 1, 1854. Lindl. F. sub 16. p. 7:

Odont. zebrium Linn. 1849. (cf. Walp. Ann. III. 559.)

Undoubtedly this is an *Oncidium*, as Rehb. has now pointed out. Since the article *Odontoglossum* was written, I have received it from the collections of Moritz, and find it to be a plant with a straggling, twining panicle of flowers resembling those of *O. trilingue* (N. 5.), but smaller. Its long lip acutely angular at the base, and its crest are characteristic; the latter consists of a central ridge formed of five long confluent lamellae with as many sharp teeth in front and several straggling warts on either side.

Wild in Caracas. Moritz. — L. F. *Odont.* p. 14.

Rehb. fil. l. c. Bonpl. II. 12: *Oncidium zebrium*. Caracas. Wagener.

17. *ONCIDIUM ORGYALE* Rehb. fil. Wswz. Bonpl. Ap. 15, 1854. Lindl. F. sub 17. p. 8:

O. caule longo ramoso volubili, bracteis subrotundis amplexicaulis, sepalis undulatis unguiculatis lateribus basi connatis lanceolatis, dorsali ovato, petalis ovato-oblongis subsessilibus, labello oblongo basi acutangulo apice linguaeformi deflexo columnae adnato, lamellis tribus in medio, quarum laterales pronae, media rhombea erecta dentibus 2 in fronte verrucisque pluribus in lineam obliquam ordinatis, columnae clavatae glabrae alis obsoletis dentiformibus obtusis vel emarginatis.

Flowers one inch and a half in diameter, dark violet. Leaves a foot and more long, by one inch and a half wide, acute, narrowed and channelled at the base. The crest consists of three plates, of which the middle one is triangular and erect, the laterals adnate, all vanishing towards the foot of the column; in addition to which there are two small teeth in front, and a diagonal line of warts on each side. The column was certainly not apterous in any of the specimens examined by me.

Wild in New-Granada; in the province of Mariquita—Triana, 133. Warscewicz; in the province of Pamplona, at the height of 9000 feet, flowering in November—Schl., Nr. 3, Nr. 1167 hb. Hooker, Nr. 1168 Rehb.

Rehb. fil. v. Warscewicz Bonpl. II. 102:

Aff. *O. undulato* labelli carina rhombea erecta, lamella supina utrinque, ligulis parvis anticis geminis, gynostemio aptero.

Pedunculus validus tortus orgyalis, ramuli gracilenti baseos flexuosi pedales, internodiis bipollicaribus, —9flori, bractee ovatae acutiusculae cucullatae ovaria pedicellata tertia parte aequantes, sepalorum pars quarta infima linearis; unguis; reliqua lamina oblonga acuta basi supraungiculari latissime cuneata, subundulata, tepala brevissime ac late unguiculata, triangula, basi obtusangula, apice acuta, subundulata, tepalis basi supraungiculari paulo latiora, ac breviora, labellum a basi hastata triangulum, utrinque medio extrorsum curvilineum, hinc bis sinuatum; acutum, sepalis subduplo brevius, carina in disco basilari oblique antrorsa, oblongo quadrata, nec tantum latere basilari affixa, lamella obtusangule triangula prostrata extrorsa utrinque in latere, ansis 2 minutis postice, ligulis 2 parvis anticis, gynostemio antrorsum curvo, aptero, pone latera foveae rotundato, basi tamen utrinque replicato subalato, ab labello prope libero. Blüten etwas grösser, als bei *O. undulatum*, von denen sich die Art durch die Buckel der Lippe und durch die flügellose Säule gut unterscheidet. Das uns völlig unbekannt *O. cordatum* Lindl. hat eine genagelte Lippe; schmale spitze Seitenlappen. *O. loxense* Lindl. — uns auch unbekannt — hat eine rundliche Lippe und Arme an der Säule; soll dem *O. corynephorum* nahe stehn. New-Granada. v. Warscewicz.

Rehb. fil. Bonpl. II. 279. Ocanna. 6—7000'. Wälder. Mai. Nr. 1168. Schlim.

18. *ONCIDIUM TENENSE* Rehb. fil. Bonpl. May 1, 1854. Lindl. F. sub 18. p. 8:

Prof. Reichenbach rightly compares this for appearance to *O. falcipetalum*. It is distinguished by the two small triangular wings being stationed at the base of the stigma, and by the crest, which consists of a few triangular keels pointing forwards, and some sinuous roundish warts standing on either side between it and the lower edge of the lip. I do not find, that the lip is retuse and tridentate as described by Rehb., who seems to have examined an injured specimen.

Wild in New-Granada, near the village of Tena, in the province of Bogota—Hartweg. Warscewicz.

Rehb. fil. Bonpl. II. 107:

Aff. *undulato* sepalis brevissime lateque unguiculatis, labello apice retuso obsolete tridentato, carina media erecta triangula, gynostemio gracili a labello libero.

Pedunculus scandens validus, ramuli abbreviati bi—triflori, bractee ovatae acutae cucullatae membranaceae conspicuae, sepalum summum oblongum acutum late breviterque unguiculatum basi utrinque exariculatum, sepala lateralia subaequalia, ungue infima basi communi, laminis rotundis acutis undulatis, tepala latoelliptica acuta, undulata subsessilia ungue lato ac brevissimo, sepalis quarta breviora, labellum triangulum elongatum, basi tamen brevissime ac latissime marginibus ab angulis apiculatis ascendentibus cuneatum (hinc quasi trapezoideum), apice retuso obsolete tridentatum, carina a basi gynostemii ascendens, triangula, anceps antrorsa, addita utrinque carina humilis, versus basin gynostemii, in pede antico papula utrinque triangula parvaeque quaedam circumjectae; gynostemium gracile, recurvum, androclinium haud valde ascendens, auriculae minutae ligulatae antrorsae utrinque pone basin

foveae, tabula infrastigmatica utrinque angulata. Gynostemium super labellum erectum nec cum basi connatum! (more *O. undulati*, *refracti*). *Cyrtochilum undulatum* Lindl. in pl. Hartw. exsicc. Blüten so gross, wie die des *O. falcipetalum* Lindl. Bei dem Dorfe Tena in der Provinz Bogota. Hartweg.

19. *ONCIDIUM CORYNEPHORUM* Lindl. Sert. Orch. sub t. 25. F. l. c. p. 8:

Cyrtochilum volubile Pöppig N. G. I. 35, t. 61!

Scapes twining, fifteen to twenty feet long. Sepals dull brown; petals pale cinnamon, white on the upper half; lip deep crimson, white at the base. The crest consists of three connate parallel ribs, and a few round tubercles on each side. Column absolutely apterous. I have a flower of the original specimen in Pöppig's collections, from Rehb.

Wild in Peru; Mayobambo Matthews in hb. Hooker; tall trees on the mountains of Casapillo, near the hacienda of Cuchero-Pöppig.

Lindl. Sert. l. c.: Pseudobulbis angustissimis compressis, foliis anguste-lanceolatis acutissimis, scapo ramoso paniculato, bracteis membranaceis subrotundis obtusissimis, sepalis petalisque subrotundo-oblongis longe unguiculatis, petalis angustioribus lanceolatis acutis reflexis, labello sessili obovato rotundato, callis baseos depressis apice trinis latere rugosis tuberculatis, columna clavata alis inflexis aptera. Peruv. Matthews 1918.

Lindl. Paxt. II. 129. The twining scapes 15—20' long. Flowers 2" diam., deep crimson, above the middle. No doubt *Cyrtochilum volubile* Pöpp. I have no doubt it is the same plant as Pöppig's.

20. *ONCIDIUM LOXENSE* Lindl. in Paxt. Fl. Garden, II. 126. L. F. p. 9:

This seems to be a very rare plant. Hartweg found but a single specimen, the panicle of which was nine feet long. The flowers are as in *falcipetalum*; their colour seems to be purple, judging from the dried specimen.

Wild in Peru; on the Cordillera near Loxa—Hartweg.

Lindl. l. c.:

Panicula ramosa divaricata ramulis 2—3 floris, bracteis brevibus ovatis obtusis, sepalis oblongis planis reflexis petalisque paulo latioribus apice rotundatis, labello subrotundo basi subhastato, apice excavato, callis baseos 3 parallelis ramentis pluribus a fronte, columna aptera basi bibrachiata.

Cordillera near Loxa.

Of this a single plant was found by Hartweg, with a flower stem 9 feet long. It is very near *O. corynephorum*, but the flowers are more than twice as large, the lip has quite a different form and the column has two short spreading arms near the base, of which no trace is to be found either in Pöppig's figure or in Matthews's drawing in our possession.

Cimicifera.

21. *ONCIDIUM MICROCHILUM* Bateman in Bot. Reg. 1843. t. 23. L. F. p. 9:

Flowers in a large glaucous branching panicle. Sepals dull brown; petals dull purple with a yellowish border; lip spotted, crimson and yellow in the centre, pure white on the side lobes. Wings of column yellow, painted with purple.

Wild in Guatemala. Skinner.

Bat. l. c. B. Reg. XXVI. 1840. Misc. 193:

Pseudobulbis lenticularibus brevibus monophyllis, folio ensiformi carinato carnosissimo acuto quam scapus erectus versus apicem paniculatus quadruplo brevior, sepalis liberis lateralibus longius unguiculatis retusis, labello subrotundo tridentato sepalis duplo brevior, crista sub-

rotunda 5 crenata dente intermedio labelli parum brevior, columnae nanae alis oblique truncatis.

Guatemala. Skinner leg., Bateman col. He truly calls it a most distinct and remarkable species, the smallness of its lip, which is not half so long as the lateral sepals being a singular feature. The leaves are about 8" long, the flowers the colour of *O. crispum*.

Lindl. l. c. 1843. t. 23: eadem quae supra, ceterum:

Folio oblongo —, labello duplo latiore, quam longo, lobo intermedio nago triangulari, lateralibus rotundatis planis, crista reniformi crenata, columnae nanae alis subulatis apice glanduligeris.

22. *ONCIDIUM CIMICIFERUM* Rehb. fl. Lindl. F. sub 22. p. 9:

Odontoglossum camiciferum Rehb. fl. in Linn., Xen. 849. Fol. Orch. Nr. 43.

Cyrtochilum flexuosum HBK. LO. p. 210.

Oncidium flexuosum Lindl. Sert. Orch. sub t. 48, not of Sims.

A small-flowered species with a great straggling climbing panicle. Flowers brownish with a yellow stain on the lip. We owe to Mr. Rehb. the identification of this with „HBK.'s“ *Cyrtochilum flexuosum*, which had been previously a mere puzzle.

Wild in New-Granada; at the foot of the lofty mountain Paramo de las Achupallas between Almaguer and Sa. Cruz, at 9500 ft. — H. and B.; Venezuela, near Agua de Obispo, at 8000 ft. — Funck and Schlim, 1027; Merida, at 8000 feet. — Schlim. fl. Rehb.

C. Walp. Ann. III. p. 559. *O. flexuosum* Lindl. Sert. Rehb. fl. in Bonpl. II. 12: *Cyrtochilum flexuosum* Humb. Kunth. Merida. 8000'. Wagener.

Lindl. Fol. *Odontoglossum camiciferum* Nr. 43. p. 15:

O. foliis angustis lanceolatis acutis, panicula diffusa volubili, bracteis ovatis acutis cucullatis, sepalis unguiculatis, lateralibus lineari-lanceolatis acuminatis dorsali multo brevior erecto, petalis ellipticis acutis, labello subrotundo convexo apiculato linea elevata in unguem gibbere anteposito pleiodactylo, columna brevi valde clavata auriculis obsoletis.

A singular small-flowered climbing species much like some *Oncidium*, and remarkable for the large apparently coloured bracts, seated singly at each flexure of the straggling panicle. Flowers brownish, with a yellow spot on the lip (F. and S.), which much resembles in form some species of *Cimex*. I am unable to make out any auricles on the column. Mr. Reichenbach mentions them as very short, usually obsolete, ear-shaped and acute.

Wild in Venezuela; in the province of Truxillo, near the Agua de Obispo, at the height of 8000 feet, flowering in September—Funck and Schlim, 1027; Moritz 1096b, R.

Lindl. Sert. l. c.: Neu-Granada. Lip ovate, acute, convex, crested with tubercles at the base. Scape several feet high, much branched, with triangular ramifications etc. to them. A mere puzzle without access to the orig. specimens.

23. *ONCIDIUM COCCIFERUM* Rehb. fl. in Bonpl. Ap. 15, 1854. L. F. sub 23. p. 9:

A species with great panicles of small brown flowers. Distinguished from the last by the crest and by the lateral sepals being ovate and hardly longer than the lip.

Wild in Peru; at the sources of the Marañon—Warszewicz; Neu-Granada, Mesa Rica, in the province of Ocanna, at 9000 ft. — Schlim., 30; St. Miguel in the Sierra Nevada of Sta. Martha—Purdie in hb. Hooker.

Oncidium (*Cyrtochila camicifera*) *cocciferum* Rehb. fl. Warszew. Bonpl. II. 101:

Aff. *O. camicifero* Rehb. fl. (flexuoso Lindl. nec Sims.) sepalis tepalisque subaequalibus, labello nullibi velutino, carina utrinque tridentata acuta per discum, verruculis circumstantibus, gynostemio utrinque biauriculato. Panicula ampla laxa, diffusa fractiflexa (hinc illi *Oncid. pulvinati*, illinc illi *O. camiciferi similis*), ramuli 3–5 flori, valde fractiflexi, bracteae triangulae acutae, septimam ovarii pedicellati vix aequantes, tepala transversa ovata apiculata, latius unguiculata, lateralia vulgo dorsali aliquid longiora

tepala sepalo dorsali subaequalia, labellum triangulum, basi hastato cordatum, tepalis paulo brevius, carina depressa a basi usque ultra medium, apice acuta, utrinque tridentata, dorso hinc illic varicosa s. verruculosa, verruculae hinc illic circumjectae, locus velutinus utrinque pone carinam nullus, gynostemium humile, limbus infrastigmaticus utrinque sub fovea stigmatica auriculata productus. — Blüthen etwas grösser, als die des *Oncidium flexuosum* Lindl. N.-Granada. v. Warscewicz.

Rchb. fl. Bonpl. II. 279. Blüthen braun. Lippe gelb. Neu-Granada. Provinz Mesarica. 6000'. Juli. Nr. 30. Schlim.

Rchb. fl. Bonpl. III. 66. Teoramas. Wagener.

24. *ONCIDIUM TRULLA* Rchb. fl. in Bonpl. Ap. 15, 1854. L. F. p. 9:

Said by Rchb. to resemble *O. cimiciferum* (nr. 22). The bracts are described as very minute, the panicle three feet long, the lip triangular, about as long as the petals, angular at the base, the crest composed of one narrow erect keel sloping to the base, having a few lobes and hooks on each side, and a downy space in front of the keel. The flowers are smaller than in *O. cimiciferum*. A fragment communicated by Rchb. shows that this is a correct statement. The plant is very near *O. examinans*.

Wild in New-Granada. v. Warscewicz.

O. (Cyrtochilum flexuosum) trulla Rchb. fl. v. Wswz. Bonplandia II. 101:

Affine *O. flexuoso* bracteis minutissimis, labelli carina erecta lobulis carinisque lateralibus aucta, gynostemio anguligero.

Panicula tripedalis, rami rari, cum ramulis tenues, fractiflexi, bracteae triangulae acutae ovarii pedicellati quintam sextamve aequantes, sepala oblonga acutiuscula, lateralia longiora, omnia dimidio minori inferiori latius unguiculata, ungue in cuneatam laminae basin sensim transeunte, tepala ovata acuta basi cuneata, sepalo dorsali bene breviora, labellum triangulum tepalis subaequale, basi utrinque supra angulos laterales acutiusculos prosilientes rotundatum, margines laterales etiam subrotundati, carina angusta erecta ascendens et praerupta a basi in medium, lobulis ansisque quibusdam lateralibus, regio carinae proxima subvelutina, gynostemium clavatum, utrinque sub fovea angulatum. Blüthen kleiner, als bei *O. cimiciferum* Rchb. fl. Neu-Granada. v. Warscewicz.

Diese zwei Arten stehen dem *Oncidium cimiciferum* Rchb. fl. sehr nahe. In Bezug auf Tepala und die sammtige Umgebung des Kieles ist *O. trulla* sehr übereinstimmend mit diesem, allein es fehlen die Zähnen vor dem Kiele. Die Säule hat Ecken, die Deckblätter sind nicht gross und kappig. Das *Oncidium cocciferum* ist sehr verschieden durch kleine Deckblätter, fast gleich breite Sepala und Tepala, mangelnden Samtstreck beiderseits des Kiels, keine Fingerchen vor demselben, Ecken der Säule u. s. w.

Rchb. fl. Bonpl. III. 66. Pseudobulbus und Blatt wie bei *Odontoglossum odoratum* Lindl. 6000'. März. Ocanna. Wagener.

25. *ONCIDIUM EXAMINANS* Lindl. Fol. I. p. 9. N. 25:

O. folio lato-ensiformi canaliculato panicula divaricata ramosissima multo breviora, ramis ramulisque arcte flexuosis, bracteis minutis, sepalis subrotundis acutis unguiculatis, petalis subsessilibus latioribus, labello obtuse triangulari, crista carinata utrinque bicallosa verruca remota utrinque, col. rostri basi bigibba alis semiovatis acutis erectis.

This is a strong growing plant with oblong pseudobulbs, leaves 18 inches long, and a stiff branching straggling panicle at least twice as high. The flowers are small, apparently brown, and as thickly clustered on the branches as a swarm of bees. It differs from *O. trulla* in its large acute columnwings, less simple crest, with a pair of outlying papillae. A small specimen was sent some years ago from N. Pescatore's collection under the name of *O. dichromaticum*, applied by Rchb. to a different species.

Wild in the Caracas. Santa Martha — Purdie.

26. *ONCIDIUM PUSILLUM* Rehb. fl. Mss. *O. iridifolium* H. B. K. Huc: *Epidendrum pusillum* L. Sp. Pl. 1352 etc. cf. L. O. p. 202: L. F. sub 26:

This very common plant seems to occur everywhere within the tropics of America: but other species are no doubt sometimes mistaken for it. According to Descourtitz it is found in Brazil exclusively on branches of the Orange and Lemon tree, choosing dry places exposed to the sun; but Mr. Spruce gathered it on the Sapotilla. The plant figured under this name in the „*Botanical Register*,“ t. 1911, is no doubt quite distinct as Prof. Reichenbach has pointed out (*B. Zeit.* 1852, p. 697). See *O. decipiens* hereafter (Nr. 68).

Wild in tropical America; Mexico, province of Mirador — Linden; Guatemala — Skinner; Guayaquil, on trees — Jamieson; Peru — Maclean; N.-Granada — Lobb, Purdie; Guayana — Schomburgk; Brazil, on trees near the Para — Spruce 104, 106.

Lindl. Bot. Reg. XXIV. (1838). sub t. 38: Branches of Orange and Lemon trees only. Very common in the neighbourhood of the town of Jesus de Bananal. It prefers dry places, exposed to the sun. Brazil. Descourtitz. — Sert. sub 48: „scapo simplici, subbifloro, labelli maximi crista depressa quinqueloba apice truncata.“ — A small species with singularly large flowers for its size otherwise. The fruit is large, has six transparent wings.

27. *ONCIDIUM GLOSSOMYSTAX* Rehb. fl. in B. Ztg. 1852, p. 697. L. F. sub 27. p. 11:

Very like the last, with which it is no doubt confounded; the crest consists of four linear arms, each terminated by a tuft of hairs. Apparently Schlim's 1023 from Ocanna is the same, but my solitary flower is not sufficiently examinable.

Wild in Guatemala — Skinner; Peru — Rehb., Mathews in hb. Hooker; Mexico, Vera Cruz, on Mimosas, near rivulets, very rare — Galeotti 5133.

Oncidium glossomystax Rehb. fl. in v. Mohl und v. Schl. B. Z. 1852. 696:

Perigonii phyllo summo ovali acuto, lateralibus externis lanceolatis acutis, internis oblongis, acutis, vix majoribus, labello brevissimo late cuneato, trilobo, lobis lateralibus oblongis retusis, apicem versus dilatatis, medio late unguiculato, dein dilatato, reniformi, bi-, seu quadrilobo, lamellis 2 supinis parvis in basi antrorsum in fila plurima laceris, crista anteposita rhombea dorso aequaliter penicillata, gynostemii alis dolabriformibus, vix crenulatis, alulis parvis suppositis, rostello retusiusculo.

Eine niedliche Pflanze mit 3 — 4" langen Blättern, haardünnen, 1 — 2 blüthigen Blütenstielchen, ganz kurzen, gekielten Deckblättern. Blüten halb so gross, als die des *O. iridifolium*. Loxa, Rehb. fl. l. c.: Tocache in Peru. 857. Pöppig.

Rehb. fl. Boupl. III. 66. Ocanna, 3000'. März. Wagoner.

28. *ONCIDIUM PUMILIO* Rehb. fl. in L. F. sub 28. p. 11:

This is said to be very like the last, but different in the lip and column. The former has a double crest, the lower half of which is rather the longer, with a few finger-like lobes, the upper half shorter, deeper, with upper edge lacerated. The wings of the column are described as quadrangular and nearly entire. A flower from Prof. Rehb. shows it to be very distinct from the preceding.

Wild in Brazil — Martius hb. 564.

O. Pumilio Rehb. fl. in v. Mohl und v. Schl. B. Z. 1852. 695:

Perigonii phyllo summo ac lateralibus internis ovatis, minutis, lateralibus externis lanceolatis, acutis, labello basi cuneato, dein trilobo, lobis lateralibus auriculaeformibus, abbreviatis, medio cuneato, dein dilatato, quadrilobo, lobis externis obtusangulis, dilatatis, medianis multo angustioribus productis, carina bipartita in basi, partitione postica paulo longiori, oligodactyla humiliori, anteriori margine superiori lacera, breviori, altiori, alis gynostemii quadratis, assurgentibus, subintegerrimis.

Vorigem täuschend ähnlich, allein durch Lippe und Säule weit verschieden. Von Martius Herb. Brasil. 564. —

B. Scapus elongatus.

29. *ONCIDIUM HENEKENII* Lindl. Fol. sub 29. p. 11:

O. foliis cultratis obtusis denticulatis scapo subpaniculato multo brevioribus, rhachi flexuosa, sepalo inferiori bifido 2-carinato, labello obovato emarginato pubescente, crista maxima hirta antice bipartita caudis 2 utrinque, columna basi dente truncato antice aucta, alis minimis linearibus.

This very curious plant might be mistaken, when out of flower, for *O. variegatum* but its remarkable zigzag rachis, dark brown flowers, and strange hairy crest, are unlike anything else in the genus. This crest resembles a shaggy plate, nearly as large as the lip itself, cloven by a deep anterior slit, and divided on each side into three parts, of which the two basal are taper and tail-like, while that in front is half-lanceolate. The stigma is a projecting cucullate space, almost as much raised above level of the anther-bed as in a *Neottia*.

Wild in St. Domingo; Ponton, on Cacti, *Randia* and other prickly bushes—Schomb.

30. *ONCIDIUM TRIQUETRUM* L. F. p. 12. — Hook. Bot. Mag. 3393. — Hook. Lond. Journ. Bot. III. 1844. 527. Jamaica. Purdie. Sert. O. sub 48:

Foliis triquetris cultratis acutis, scapo simplici 5-floro, sepalis acutis

anlicis connatis, petalis multo majoribus, labelli lobo medio ovato indiviso lateralibus rotundatis, crista nulla, columnae alis falcatis bilobis.

Jamaica.

Flowers purple and white, lip white with a few deeper dots.

31. *ONCIDIUM PULCHELLUM* Hooker B. M. t. 2773. L. O. 206. [Bot. Cab. t. 1984. Bot. Reg. t. 1787. Paxton's Fl. Gard. sub t. 33. L. F. p. 12:

Flowers large, in a close panicle, white, with a tinge of pink, a yellow crest, and rosy column wings. The upper sepal is boat-shaped, and the round lateral lobes of the lip are as large as half the middle lobe.

Wild in Jamaica—Bancroft etc.; Demerara.

Lindl. Sert. sub 48: Perigonium roseo album, alis columnae purpureis, crista labelli flava. — Quite the habit of *O. variegatum* and *tetrapetalum* from both of which it is readily distinguished by the lateral lobes of its labellum and cymbiform upper sepals. Its crest is also essentially different, consisting of 3 narrow, nearly equal collateral obovate calli, in front of which is placed a short tubercle. Its flowers are pure white, with a little orange about the crest of the lip. Column is pink.

32. *ONCIDIUM LEMONIANUM* Lindl. Bot. Reg. t. 1789:

O. Guibertianum A. Rich. in De la Sagra hist. fisic. pol. y nat. Cub., p. 245 (t. 81.)

Raceme simple. Flowers bright yellow, dotted with crimson. Column wings half ovate, obtuse, repand; lip with the middle lobe serrate and deeply lobed. I am indebted to Prof. Rehb. for Richard's specific character of *O. Guibertianum* in De la Sagra's work on Cuba, which is not within my reach. There is no doubt that it is a synonym of *O. Lemonianum*. Prof. Rehb. informs me, that the copy of the work in the Berlin library wants the plate referred to by Richard in the text. — Antigua. Uhde.

Lindl. Bot. Reg. XXI. 1836. 1789:

Foliis compressis acuminatis supra sulcatis, scapo stricto paucifloro, sepalis parvis spatulatis apiculatis omnibus liberis, petalis oblongis undulatis, labelli laciniis lateralibus abbreviatis intermedia maxima reniformi biloba, lobis dentatis ungue brevi margine denticulato, columnae alis subquadratis truncatis oblique undulatis. Perigonium flavum, maculis quibusdam purpureis. Cuba.

Lindl. Pl. Lindl. 1816. p. 13: A little epiphyte with bright yellow flowers growing on old Coffee trees of the Sierra Maestre and on shrubby trees of the plain of Guatana. Cuba. Mai — Aug. 1758.

Obs. Planta mihi penitus dubia est *Oncidium Guibertianum* A. Rich. Icon serius reperta et addita Berolini, quam habeo mutuam. *Oncid.* *Lemonianum* non est, nam labelli lobi laterales obtusi undulati. Folia parvula carnosae semiteretia subgladiata non bene intelligo. *Oncidium Lemonianum* praeterea affertur. Haec est diagnosis:

Oncidium Guibertianum A. Rich. Ramon and Sagra p. 245. T. 81:

Ebulbe, foliis parvulis carnosis, semiteretibus subgladiatis, apice acutissimis, 2—2½ pollices altis, vix 2—3 lineas latis glabris verrucoso punctulatis, scapo radicali simplici palmari 3—4 floro, floribus resupinatis luteis, breviter pedunculatis, bractea semiamplexicauli appressa lanceolata acuta suffultis; sepalis parvulis patulis, supremo libero spatulato oblongo apice acuto; lateralibus approximatis tertia parte inferiori inter se coalitis, spatulato lanceolatis aculis, petalis unguiculatis, obverse et late panduratis lobo terminali latiori quam longo apice emarginato; labello maximo unguiculato, multo latiori quam longo emarginato bilobo, lobis lateralibus obtusis undulatis, suberoso denticulatis, basi punctis fuscis cristatis; caruncula subquadrata prominenti obtuse bidentata; gynostemii alis latissimis, subtruncatis, anthera oblonga parce prominente medio subcristata. Cuba.

33. **ONCIDIUM UROPHYLLUM** Lodd. Cat. ed. 2., nr. 1381. Lindl. l. c. sub 33. p. 12:
 Flowers in a loose panicle, deep yellow above, pallid beneath, with crimson stains about the crest and at the base of the petals.
 Wild in Brazil. Loddiges.
 Lindl. Sert. sub 48: Flowers bright yellow, in a slender delicate panicle, as much as 4' long. Centre of the lip and base of the petals reddish brown.
 Lindl. Bot. Reg. XXVIII. (1842.) 54:
 Folis equitantibus margine plano acutissimis, scapo longo pendulo paniculato, sepalis linearibus acuminatis lateralibus ad apicem fere connatis, petalis obovato-subrotundis apiculatis, labelli lobis lateralibus brevibus convexis obtusis, intermedio unguiculato reniformi emarginato, cristae tuberculis duobus uno ante alterum trilobis, columnae alis maximis acinaciformibus rotundatis. Brazil.
34. **ONCIDIUM MIRABILE** Rehb. fl. Lindl. Fol. Nr. 31. Cf. Lockhartiam.
35. **ONCIDIUM ONUSTUM** Lindl. Fol. sub 35. p. 12:
 Flowers large, very densely arranged in a nodding raceme, apparently white. Column very short, with two long linear arms. Lip with a crest consisting of three rounded concave lobes. By mistake this has been hitherto misplaced in the genus its equitant leaves having been overlooked.
 Wild in Panama and Western Columbia. Cuming 1208.
36. **ONCIDIUM TETRAPETALUM** Lindl. Fol. sub 36. p. 12:
 (A.) Flowers small, dingy brown, with rose-coloured speckles.
O. pauciflorum L.O. p. 198.
 (B.) Flowers large, in a close panicle, brilliantly coloured white, green and crimson.
O. tricolor Hooker, Bot. Mag. t. 4130.
 A very common and rather variable West Indian plant, always having a lip snow-white except around the crest. There is no difference between A. and B. except, that the latter is on a larger scale, and has very bright green sepals and petals banded with crimson. A narrow-leaved var. found by Lobb in N. Grenada occurs in Sir W. Hooker's herbarium. It is evident the plant varies much in size.
 Wild in the West Indies; A. Jamaica—Swartz; Mexico—Pavon; N.-Grenada—Lobb. B. Jamaica?—Purdie? Cumana—Fink, 293, in hb. Hooker.
 Lindl. Bot. Reg. 1838. (XXIV.) Misc. 56: Flowered lately in the Garden of Hort. Soc. imported by John Henry Lancas, Esq. from Jamaica. It proves to have triquetrous leaves, and therefore has been arranged in its wrong place in the work above quoted. Although the flowers are among the smallest in the genus, they are extremely pretty. The labellum is a pure dead alabaster white, except at its base, where it is covered with yellow and brown tubercles. The sepals and petals are gaily barred and spotted with brown, while the column has 2 large pink spotted spreading wings. Jacq. describes the species as having a flowering scape 2' high; that which appears in the Hort. Gard. was scarcely 6" high, for the plant though healthy was weak and had suffered from its voyage. When in perfection this species will be found among the handsomest of the smallflowered epiphytes.
 Lindl. Sert. sub 48: „crista bis—ter tuberculata, alis columnae magnis acinaciformibus denticulatis.“ — A small species, with olive brown flowers, whose lip is pure white except in the middle. The crest consists of 6 blunt tubercles in two series, one resting on the other.

32. **ONCIDIUM VELUTINUM** Lindl. in Paxt. Fl. Gard. under t. 33. L. F. 13:
 In general appearance, this and *O. variegatum* correspond, as also in the ragged edge of the foliage; but they differ in the flowers of this being downy, the wings of the column blunt, the middle lobe of the lip perfectly sessile, and the lateral lobes joining it by a broad base. The crest, too, consists of five tubercles, of which the

uppermost are much the longest. The plant is stated by M. Linden to vary with white or rose-coloured flowers, as well as in stature — a large form growing in the Pine forests of Yatera, in Cuba, the smaller on Coffee-trees in the Sierra Maestra and on the Liban mountain.

Wild in Cuba—Linden, 1759; St. Bartholomew's—Fournström in hb. Rehb.

Lindl. l. c. p. 166:

Foliis acutis carnosis equitantibus serrulatis, floribus velutinis paniculatis, sepalo dorsali obcordato lateribus in unum obtusum cochleatum connatis, petalis suborbicularibus basi paululum angustatis, labelli laciniis lateralibus rotundatis, quam petala multo minoribus in intermediam decurrentibus latam sessilem bilobam; cristae tuberculis 2 posticis elongatis tribusque minoribus anticis, alis columnae acinaciformibus obtusis integerrimis.

O. variegatum Orch. Lind. Cuba.

Lindl. Orch. Lind. p. 13. Nr. 72. A graceful epiphyte. Localities of *Oncidium Lemonianum* etc. quae supra.

38. *ONCIDIUM VARIEGATUM* Swartz l. c. sub 38. p. 13:

When in health the leaves are fleshy, three or four inches long, equitant, sharp-pointed, and very much broken at the edge. The panicle is a foot and a half high, erect, with flat, pink flowers, richly stained with cinnamon-red on the petals, and at the base of the sepals and lip. The lower sepals form a blunt spoon-shaped body; the petals are large, obovate, almost retuse, with an intermediate point; the lip has the middle lobe distinctly placed upon a somewhat serrated isthmus; the crest consists of two sets of tubercles, one lying on the other, the upper set made up of two large lateral ones, and a minute one in the middle, the lower set, of three equal blunt ones, the intermediate of which is curved upwards.

Wild in the West-Indies; St. Domingo, Mackenzie, chiefly in the Cibao district, where it is called „Angelida“ — Schomburgk; Cuba — Sir C. Lemon.

Lindl. Sert. sub 48: Foliis oblongis acutis, complicatis falcatis margine cartilagineo serrulatis, scapo multifloro simplici paniculato, sepalis obtusis, sublobatis, labelli lobis lateralibus ovatis obtusis recurvis, intermedio reniformi undulato bilobo minori, crista trilamellata, columnae alis acinaciformibus integris.

St. Domingo. Cuba.

Dist. from *O. tetrapetalum* by its broader, serrulated leaves, and its acuminate, not obtuse sepals. It is also a much larger plant.

Lindl. Paxt. I. p. 165. t. 33: Foliis carnosis acuminatis serrulatis, floribus paniculatis, sepalis inferioribus in unum cochleatum connatis, petalis obovatis unguiculatis emarginatis cuspidatis, labelli laciniis lateralibus nanis acutis, intermedia lata biloba ungue denticulato, crista duplici superne biloba, inferne 3loba, alis columnae acinaciformibus acuminatis integerrimis.

The variegated *Oncid* is very like *O. tetrapetalum*, from which it differs in having the leaves broken up at the edge, petals coloured, broad and cuspidate, not herbaceous, blunt and serrulate, in the double sepals being blunt and spoonshaped, not divided into two taperpointed divisions and in its richer colours.

38b. *ONCIDIUM LEBOLDI* Rehb. fl. in Herb.:

Foliis abbreviatis acinaciformibus acutis, dorso ac ventre retuso crenulatis, dorso rectis, vertice semiovalis siccis bene nervosis, pedunculis superne racemosis, paucifloris, sepalo summo cuneato oblongo obtuso, inferiori paulo latiore binervi, bidentato, tepalis cuneato oblongis obtusis, longioribus, quater latioribus, labello pandurato partitionibus posticis triangulis limbo antice denticulatis, portionibus anticis semiblongis semicordatis antice isthmo separatis, antice denticulatis

(si mavis partitione antica reniformi emarginata antice denticulata), callis trilobis geminis in basi deinceps, lobo medio longiori, omnibus lobis obtusis, columnae alis dolabriformibus denticulatis, tabula porrecta.

Cuba. Leibold! Wright (*Oncidium variegatum* Lindl. nec Sw.) 668.

40. ONCIDIUM STIPITATUM Lindl. in Bot. Sulphur. p. 172. L. F. l. c. p. 43:

O. lacerum Lindl. Bot. Reg. 1846. t. 27.

Flowers larger, than in the last, pale sulphur-yellow with sepals and petals dotted with crimson, and a crimson stain below the crest. Middle lobe of lip with a long narrow isthmus, coarsely-toothed and two-lobed; lateral lobes falcate. Wings of downy column half ovate, acute.

Wild in Panama—Sinclair.

O. stipitatum cf. Walp. Ann I. 789. *O. lacerum* Lindl. cf. Walp. l. c. addendis:

Habit of *O. longifolium*, but rather denser, flowers with a lacerated and rather crisp middle lobe to the lip, and a crest consisting of one transverse tubercle like that of *O. nudum*, and another larger, compressed, rounded, and at right angles to it in front.

41. ONCIDIUM SPRUCEI L. F. p. 14. sub 41:

O. racemo paniculato, rachi flexuosa, sepalis petalisque obovatis obtusis, labelli lobo medio transverso bilobo anguste unguiculato, lateralibus obovatis, cristae tuberculis 3 medio, erecto rotundato compresso, lateralibus acutis pronis, columnae alis circularibus.

Leaves furrowed, some times two feet seven inches long, and two and three quarter inches in circumference. Sepals and petals yellow, coloured with red above. Lip yellow, stained with red at base, and spotted with red at back. — Spruce. This

seems to be distinct from any of the forms of *O. Cebolleta*. Mr. Gardner distinguished it under the name *O. urophyllum*, now otherwise applied.

Wild in Brazil; common on trees at the junction of R. Negro and Solimaes—Spruce, 1526; on trees to S. of Oeiras—Gardner, 2732; common on the branches of a species of *Geoffraea* between Ico and Crato—vernac. Rabo de Satu or Armadillo's tail.

42. *ONCIDIUM CEBOLLETA* Swartz Act. Holm. 1800. 240. L. O. 206. L. F. p. 14:

(A.) Flowers smaller; lateral lobes of lip small, obliquely ovate. Leaves very long, erect.

O. juncifolium Lindl. Coll. Bot. p. 27.

O. Cepula Hoffm.

(B.) Flowers with the lateral lobes of lip obliquely ovate-oblong. Leaves very short, erect.

O. brachyphyllum Lindl. B. R. sub t. 4.

(C.) Flowers large, in a dense panicle. Lateral lobes of lip dolabriform. Sepals and petals very blunt. Leaves long, spreading on the ground.

O. longifolium Lindl. in Bot. Reg. 1841. Misc. 56. 1842. t. 4.?

Wild in the West-Indies, etc.; A. Carthage in woods—Jacquin; Brazil, near Santarem in Para—Spruce; Sa. Martha—Purdie; Mexico, in the prov. of Mirador—Linden, 225; B. Mexico—Hartweg; C. Mexico—Hartweg.

Different as these plants often are, I feel persuaded that they are only forms of one common variable species. The peculiarities of the leaves seem to depend on the place of growth. C. is the most distinct of the three. In some states the corolla is spotted with rose-colour at the back, in others it is quite whole-coloured. Although seldom cultivated, even the worst of the forms makes a gay addition to a collection.

Huc: *O. longifolium* Lindl. Bot. Reg. XXVI. 1841. Misc. 56:

Foliis teretibus longissimis diffusis, scapo erecto dense paniculato, sepalis petalisque apiculatis, obtuse concavis, labelli lobis lateralibus oblique ovatis intermedio obovato bifido minoribus, tuberculo basi depresso antice tricorni glabro, columnae alis brevibus rotundatis.

Although this species has the foliage of *O. Cebolleta*, it is really very different, forming dense panicles, 3 feet long, of very large and showy yellow and brown flowers. Its leaves are often 3' long and hang down or spread upon the ground instead of standing stiff and erect, as in the allied species, several of which are as yet but little known. Imp. Hort. Soc.

Bot. Reg. XXVIII. 1842. 4. Folia tripedalia, flagelliformia, prostrata. Scapus 3-4-pedalis paniculatus. Sepala et petala lutea sanguineo-maculata; labellum luteum sanguineo prope basin marginatum. Mexico.

Huc: *Oncidium brachyphyllum* Lindl. l. c.:

Foliis crassissimis brevibus erectis acutis, panicula laxa pauciflora, sepalis petalisque obovatis acuminatis longe unguiculatis, labelli lobis lateralibus patentibus ovalibus acutis, intermedio reniformi emarginato longioribus, tuberculo tricorni subverrucoso, columnae alis sublunatis brevibus rotundatis.

Mexico. Very short stiff leaves, and small panicles, not above 18" high.

43. *ONCIDIUM ASCENDENS* Lindl. in Bot. Reg. 1842, sub t. 4. L. F. p. 15:

Flowers scarcely larger, than in *O. nudum*, yellow with red in the region of the crest, and in the form of stains on the sepals and petals. The linear incurved column-wings are characteristic.

Wild in Sa. Lucia—herb. Banks; Guatemala—Hartweg; Mexico, Chiapanila near Oaxaca, at 2000 feet.—Galeotti, 5351.

Huc: *O. ascendens* Lindl. B. Reg. XXVIII. 1842. sub 4:

Foliis erectis junceis, scapo stricto paniculato aequalibus, sepalis petalisque obovatis obtusis concavis, labelli lobis lateralibus nanis erectis intermedio reniformi emarginato, tuberculo ovato 7-dentato, columnae alis linearibus integerrimis incurvis.

Guatemala. Has much the habit of *O. Ceboletta* but the linear wings of the column, the small erect lateral lobes of the lip, and the manytoothed tubercle distinguish it at once.

43b. ONCIDIUM SUPERFLUUM Rehb. fl. Mss.:

Pusillum, pseudobulbis cylindraceis (compressis?), folio tereti acuminato, racemo abbreviato, bracteis triangulis parvis, sepalo dorsali ligulato fornicato, sepalis lateralibus obovatis retusis, tepalis paulo minoribus, labello unguiculato, quadrato dilatato emarginato, callo semilunari in ungue, columna brevi, utrinque medio unidentata, anthera proboscidea.

Minas Geraës 778. Widgren! (Est „Leochilus“).

Obs. Plantam utramque bene diversam credo.

46. *ONCIDIUM TRICHODES* Lindl. Fol. l. c. p. 15 :

O. sepalis petalisque lanceolatis acuminatis undulatis omnino conformibus, labelli lobo minore oblato apiculato sinubus pilis laciniisque filiformibus fimbriatis, cristae callis $\left. \begin{array}{l} 3 \\ 3 \\ 3 \end{array} \right\}$ verrucis utrinque adjectis.

O. barbatum Paxt. Fl. Gard. ic. xyl. nr. 150.

Sepals and petals dark dusky brown. Lip clear yellow, with a few crimson spots on the crest. Panicle one foot and a half long and branched.

Wild in Brazil; Para—Knowles.

Huc: ex Fl. G.: Differs from *O. ciliatum* in its petals being acuminate, not obtuse or emarginate, in the middle lobe of the lip being smaller (sometimes very much smaller than the lateral lobes) and in the central tubercles of the crest being furnished with several smaller one on each side, a circumstance overlooked in the figure by Mr. (now Sir) W. Hooker, published in Collectanea.

47. *ONCIDIUM BARBATUM* L. O. p. 200. Coll. Bot. t. 27. F. p. 16:

(A.) *verum*. Sepals and petals cinnamon-brown. Middle lobe of lip very short and emarginate.

O. microglossum Klotzsch in Allg. Gartenztg. 1855. p. 234.

(B.) *ciliatum*. Sepals and petals cinnamon-brown. Middle lobe of lip apiculate and as large as the side ones.

O. ciliatum LO. p. 200. B. R. t. 1660.

O. ciliatum Hoffmgg. in Bot. Z. I. 834.

(C.) *limbatum*. Sepals and petals cinnamon-brown, spotted, with a clear yellow border. Centre of the lip very large, circular, and bright yellow.

(D.) *fimbriatum*. Sepals and petals dull brown. Middle lobe of lip larger than the laterals.

O. fimbriatum Hoffmgg. l. c.

O. ciliatum Id. ?

O. subciliatum Id. ?

With the assistance of Prof. Reichenbach I have been able to settle on a more satisfactory basis the limits of this difficult species. It is evident that it varies much in the magnitude and form of the middle lobe of the lip; and that the *O. ciliatum* of the „G. et Sp. O.“ is nothing more, than a variety of the *O. barbatum* figured by Sir W. Hooker, in the „Collectanea Botanica.“ Both have the five-lobed crest so common in the order, with an outlying tooth or two. The *O. barbatum* of „Pact. Fl. Garden“ is quite distinct, and has just been mentioned under *O. trichodes*. The varieties C and D, of which I have only seen single flowers kindly sent me by Mr. Rehb. require further examination, particularly C., especially as regards the condition of their crest. Copies of Hoffmgg.'s drawings, from the same invaluable correspondent, are my authority for the synonyms under D.

Wild in Tropical America; A. Brazil—Gardner, Swainson; B. Brazil—Hoffmannsegg, Luschnath; C. Guatemala—Rehb. f. in lit.; D. Brazil—Hoffmgg.

Lindl. B. Reg. XXIV. (1838.) sub 48: Common in the woods, which cover the low plains among the hills near Bananal. Brazil. Descourtilz.

Klotzsch in Berl. Allg. Gtz. 1855. p. 233: *Oncidium microglossum*:

Pseudobulbis suborbicularibus compressis utrinque unicastis monophyllis; foliis ligulatis complicatis subcoriaceis rotundato-emarginatis leviter carinatis, basi attenuatis; scapo erecto paucifloro; bracteis ovatis acutis carinatis brevissimis; floribus flavis fusco-maculatis longipedicellatis; perigonii foliis obovatis unguiculatis crispato-undulatis, interioribus latioribus, exterioribus lateralibus semiconnatis; labello inaequaliter tripartito, lobo medio minimo oblongo ligulato luteo subacuto, lateralibus magnis luteis patentibus brevi-obovatis obliquis, margine subundulato-crenatis sinibus suis anterioribus rotundatis fimbriatis, crista maculata multituberculato-cornuta; columnae alis latis emarginato-truncatis.

48. *ONCIDIUM MICROPOGON* Rehb. Bonpl. Ap. I. 1854. Xen. ined. Lindl. F. l. c. p. 16:

(A.) Flowers spotted with brown.

O. dentatum Klotzsch in Allg. Gartenztg. 1855. p. 234.

(B.) *chrysopterum* Rehb. fl. Flowers all yellow.

O. macropetalum Klotzsch in Allg. Gartenztg. Sept. I. 1855.

Wild in — — — — —

Certainly different from the preceding in its larger flowers, with the lateral sepals united fully half their length, and in the large flat obtuse petals, approaching in form those of *O. macropetalum*. For the synonyms I am indebted to Prof. Rehb. I have not seen a wild specimen.

O. micropogon Rehb. fl. Bonpl. II. p. 90:

Aff. *O. barbato* (quod ex intima cum *O. ciliato* affinitate et ipsis tepalis huc referendum): cristulae dentibus acutis nec fibrilligeris (quae optima *O. barbati* nota non reperitur in *Icone Lindl. Coll. Bot. 27*), alis infraapicularibus, sepalo summo tepalis subaequali, lobo labelli medio dilatato.

Sepalum summum unguiculatum oblongum undulatum apiculatum, apiculo minuto corneo; sepala lateralia a basi unguiculata bipartita, partitionibus oblongis undulatis apicem versus pagina exteriori carinatis, carina in apiculum carnosum excurrente; tepala oblonga medium versus dilatata, acuta, undulata. Labellum tepalo inferiori duplo brevius, trifidum, segmenta lateralia ab angusta basi obtusangula rhombeo flabellata divaricata, segmentum medium sessile trilobum, lobuli laterales semirotondi fimbriati, lobulus medius ab angusta basi dilatatus, rotundatus, lobulosus. Callus baseos depresso tridentatus, brevis, dentibus antrorsis, medius in carinam productam utrinque bigibberosam excurrentem. Gynostemium elatum, semiteres, utrinque sub apice abbreviate ac truncate alatum. Tabula infrastigmatica rhombea, producta, medio excavata. Hülle rothbraun. Säule und Lippe gelb, letztere am Grunde purpurfleckig. Blüten $\frac{1}{2}$ —2mal so gross als die des *O. barbato*. Von Hrn. Consul Schiller eingeführt.

Oncidium dentatum Klotzsch in Berl. Allg. Gartenz. 1855. p. 235:

Pseudobulbis oblongis compressis monophyllis; foliis angustis oblongis rigidis subtortuosis acutissimis, inferne conduplicatis attenuatis scapo brevioribus; racemo basilari paucifloro longe pedunculato; pedunculo filiformi rigido erecto e viridi-fuscescente; bracteis ovato-lanceolatis acutis tenuissime membranaceis parvis; floribus patentibus; perigonii foliolis obovatis, basi attenuatis undulatis brevissime hamato-apiculatis flavidis levissime viridi-maculatis, versus basin rubescentibus, interioribus latioribus, exterioribus lateralibus unguiculatis subduplo longioribus, basi connatis rectis divergentibus; labello columnaue luteo inaequaliter tripartito, lobis lateralibus majoribus orbiculato-obovatis, basi attenuatis retrorsum rectis sinibus suis latissimis dentatis, crista ochraceo-maculata quinquecornuta, cornubus duobus anticis et posticis lateralibus brevibus subacutis medio majore compresso, lobo medio abbreviato latissime reniformi-cordato, apice rotundato crenato; columnae alis angustissimis minutissime denticulatis.

„*Oncidium macropetalum* Lindl.“ Klotzsch in Berl. Allg. Gtz. 1855. p. 274:

Pseudobulbis ovatis compressis ancipitibus monophyllis, basi inaequaliter bifoliatis; foliis oblongis rigidis, dorso carinatis, basi brevi attenuato-conduplicatis, apice oblique recurvato-acutissimis scapo quintuplo brevioribus; racemo basilari longissime pedunculato 9—10-floro; bracteis lanceolatis acuminatis; floribus patentibus, ante anthesin longe rostratis; perigonii foliolis exterioribus elongatis undulatis cucullato-acuminatis flavidis fusco-purpureo-maculatis basi unguiculatis, inferioribus semiconnatis, interioribus brevioribus latissimis obovato-orbicularibus aureis emarginatis, inter lobos dente brevi recurvo instructis, basi subunguiculatis fusco-maculatis; labello inaequaliter tripartito, lobo medio minimo reniformi luteo apiculato, lateralibus majoribus orbiculato-spathulatis, disco orbiculari fusco-punctato plano dentato-ciliato, crista longitudinaliter obtuso-lamellata basi tri-, apice biloba tuberculis quibusdam interjectis; columnae flavidae alis parvis patentibus ovato-subtriangularibus.

Huc Regel Gll. S. 136.

49. *ONCIDIUM MACROPETALUM* Lindl. Sert. Orch. sub t. 48. L. F. p. 16:

(A.) Sepals and petals banded with brown; lateral lobes of lip very short and rounded; isthmus serrated.

(B.) *chrysopterum*. Sepals and petals much smaller, whole-coloured; lateral lobes of lip linear, obtuse, acinaciform; isthmus entire.

The general appearance of A is that of a thin, straggling specimen of *O. flexuosum*, the petals are nearly as large as the lip; the crest consists of three linear lobes, in front, then of a cluster of smaller papillae, and at the base of a middle ridge, with a broad plate on each side. B. is probably a distinct species; but I dare not establish it on the materials before me, consisting of a sketch and a bad dried specimen, with two half-decayed flowers. It is a smaller plant, the little panicle not bearing more than four or five flowers; the crest is unascertainable, but seems to consist inter alia of a pair of horn-like spreading tubercles. I am not even sure that the specimen from Bolivia and the sketch from Matto Grosso really belong to the same species; it is to the latter that the name is more particularly intended to attach.

Wild, A. in Brazil—Gardner, 4359. B. Matto Grosso—c. Weddell, Nr. 40; Bolivia, in the province of Chiquito's—hb. Weddell, 3476.

Huc: *Oncidium macropetalum* Lindl. l. c.:

Pseudobulbis ovatis compressis, foliis ligulatis acutis canaliculatis falcatis, panícula laxa erecta multiflora brevioribus, sepalis lineari-lanceolatis acuminatis, lateralibus semiconnatis, petalis obovatis rotundatis, labello fere aequalibus, labelli trilobi lacinia intermedia lunata, lateralibus rotundatis paulo brevioribus sinu serrato, crista basi trilamellata apice triloba tuberculis quibusdam interjectis, columnae alis linearibus obtusis. Brazil.

This is Mr. Gardner's Nr. 4359. a spec. with much the habit of *O. flexuosum*. Lip and petals appear to be pure yellow, sepals spotted with brown.

50. ONCIDIUM WIDGRENII Lindl. F. p. 17:

O. racemo simplici erecto folio aequali, sepalo dorsali petalisque cuneatis retusis repandis lateralibus semiconnatis acutis, labello longe unguiculato secus unguem et ultra dentibus crebris biseriatibus aucto, laciniis lateralibus linearibus incurvis intermedio cuneato bilobo, columnae alis pubescentibus obtusis falcatis.

Wild in Brazil; Minas Gerães—Widgren, 774.

Leaf solitary, three to four inches long, narrowly oblong. Raceme eight-flowered. Petals as large as the lip. This remarkable species can only be compared with the next.

51. ONCIDIUM CUNEATUM Scheidweiler in Allg. Gartenztg. 1842, 309. Bot. Reg. 1843. Misc. 15. L. F. p. 18:

It seems that this originally flowered in Germany with Count Aremberg: but it had been lost sight of until my friend the Chevalier Pinel re-discovered it. The flowers are dirty-white, in a small diffuse panicle, stained and spotted with purple, the column-wings are also purple. It is so like the last as to be easily mistaken for it, but, instead of a double fringe of teeth, the lip bears a pair of subulate recurved horns for the crest.

Wild in Brazil; on the summit of the Serra Morroqueimado, nowhere except upon cleared land where new sorts of ligneous plants have made their appearance—Pinel.

Huc: *Oncidium cuneatum* Scheidew. l. c. Lindl. l. c.:

Pseudobulbis subcylindricis, arcuatis, rugosis, apice truncatis, monophyllis; foliis lanceolatis acutis; paniculis radicalibus cernuis; sepalis lateralibus cuspidatis in unum cucullatum connatis, superiore truncato cucullato; petalis cuneatis apice minutissime crenulatis, labello trilobo, lobis lateralibus acutis, intermedio cuneato emarginato, crista triplici; posteriore quadridentata, intermedia lamellis 4 parallelis composita, columnae alis linearibus, denticulatis, recurvis, acutis.

Brasilia from Count Aremberg coll. A small species with white flowers spotted with crimson, and purple wings to the column. The leaves are 3" and 6" broad, the flower stalk 4" long.

52. ONCIDIUM ACINACEUM Lindl. Sert. Orch. sub t. 48. L. F. p. 17.

I have now seen a dried specimen of this in the Hookerian Herbarium, but it adds little to the information formerly afforded by the drawing. The oval pseudobulbs bear three leaves. The scape is spotted with purple, straight for ten or eleven inches, when it becomes a twining raceme, of which about ten inches bearing flowers are present in the plant before me. The sepals are linear, retuse, white; the petals broad, obovate, violet bordered with white, the lip of the same colour, concave, streaked with crimson, having four collateral sharp-pointed lamellae. The anther downy; column furnished with two great acinaciform ears, terete at the base, with a pair of vertical quadrangular valve-like plates just below the stigma. No other species is much like this.

Wild in Peru; on trees in Chachapoyas—Matthews, 3186 in hb. Hooker.

Lindl. Sert. l. c.:

Pseudobulbis ovalibus 2—3phyllis, foliis oblongis basi angustatis, racemo volubili multo brevioribus patulis obtusis, petalis obovatis triplo majoribus reflexis, labello obovato emarginato repando ultra medium 4 lamellato, columnae alis maximis acinaciformibus.

Peru, on trees, flowered in April.

A drawing by Mr. Matthews exists in Sir W. Hookers Herbarium. It is a most remarkable plant, with pale lilac flowers, whose lip and column wings alone are stained with bright crimson. The stem is about 1½' foot long, or longer, the raceme itself of which half a dozen flowers only are shown, in the fig., twines round small sticks.

53. ONCIDIUM ?? CANDIDUM Lindl. Cf. *Patumbinam* supra p. 699.

54. ONCIDIUM FIMBRIATUM L. O. p. 199. F. p. 18:

Wild in Brazil—hort. reg. Kew.

Known only from a drawing of a single flower, formerly seen by me in the portfolio of Francis Bauer. That drawing now forms no part of the Kew collection. The plant seems very near *O. cornigerum*.

55. ONCIDIUM CORNIGERUM L. O. 199. B. R. t. 1542. B. M. t. 3486. L. F. p. 18:

Flowers in a close panicle, yellow and brown. Column and anther downy. Anther-bed cucullate. Pseudobulbs always one-leaved.

Wild in Brazil—Miers; Rio—Gardner, 639; on trees above the Serra do Mar, and near Hytu, in the province of St. Pauls—Martius.

56. ONCIDIUM WARSZEWICZII Rehb. fl. in Bot. Ztg. 1852, p. 693! Lindl. F. p. 19:

Flowers as large as in *O. maculosum*, golden yellow, except the side of the middle lobe of the lip and the points of the crest. Raceme with from eight to twelve flowers. According to Rehb. fl. the bracts are very large and glumaceous, as long as the stalked ovaries; lower sepal with two acute lobes. Petals somewhat blunt. Lip scarcely unguiculate, rounded on either side, narrow, auriculate, then ligulate. Crest narrow, three-toothed in front, the lateral teeth turned outwards and prostrate, that in the middle a keel. Column long, with three-lobed column-wings, the upper lobe being ligulate, the lower oblong and crenulate. This exactly agrees with a flower given me by Prof. Reichenbach.

Wild in Costa Rica and Veragua, on Oaks at 8—10,000 ft. — Warszewicz. The thermometer stood at 41° Fahr. in November, and the plant perishes as soon as it descends into the warm zone. — Rehb.

Rehb. fl. l. c.:

Bracteis triangulis acutis, concavis, dorso carinatis, glumaceis, ovaria pedicellata aequantibus, perigonii phyllo summo lanceolato acuto crispulo basi curvato, infimo oblongo, labello breviori, apice bilobo, lobis acutis, phyllis lateralibus internis oblongis retusiusculis, quam summum triplo latioribus, labello basi vix unguiculato utrinque rotundato, angusto, ante basin utrinque antrorsum auriculato, dein ligulato, apice in laminam reniformem bilobam dilatato, callo in media basi angusto antice tridentato, dentibus lateralibus extrorsis supinis, carina per medium, denticulo parvo utrinque in latere, gynostemio elongato, ad foveae stigmaticae latera alato, alis trilobis, lobulo summo ligulato, inferioribus oblongis, crenulatis.

Die Entdeckung zweier Oncidien mit grossen Deckblättern ist einer der interessantesten Funde des Reisenden. Diese Art hat etwas höchst abenteuerliches durch die Deckblätter und die seltsame Lippe. — „Trugknollen rundlich, zweischneidig.“ Blätter länglich, ziemlich dünn, etwa fusslang. Blütenstengel sehr kräftig, stark, nach oben 3—5 eng, am freien Ende spitze, dürrhätige Scheiden. Aehre 8—13blü-

thig. Blüten so gross, wie die eines gutgezogenen *Oncidium maculatum*, ganz goldgelb, nur die Seite des Mittelstücks der Lippe und die Spitze der Schwelen purpurroth.

Veragua; Chiriqui Vulkan; Costarica; Carthago Vulkan, An Eichen. 8—10,000'. v. Wswz.

57. *ONCIDIUM GARDNERI* Lindl. Lond. J. Bot. II. 662. p. 19:

Very near *O. crispum* and *Forbesi*, from which it differs in the form and tuberculation of the lip, and the very small column wings. Flowers moderately large, brown, with a yellow lip.

Wild in Brazil; on trees in the forests of the Organ Mountains—Gardner.

Huc Lindl. Lond. Journ. l. c. (1843):

Floribus paniculatis, sepalis oblongis obtusis lateralibus semiconnatis petalis duplo majoribus unguiculatis subrotundis undulatis, labello transverso emarginato basi auriculato, cristae tuberculis duobus a fronte maximis intermedio minore duobus a latere linearibus binis alteris basilaribus circularibus verrucisque quibusdam in medio, columnae alis nanis rotundatis.

Hab. — On trees in forests Nr. 642. Organ Mountain (first coll.). Brazil. Gardner.

This fine species allied to *O. crispum* and *Forbesi*, is distinctly separated by the peculiar form and tuberculation of the lip, and by the very small wings of the column. The leaves and pseudobulbs are unknown.

58. *ONCIDIUM AMICTUM* Lindl. B. R. 1847. t. 66. L. F. p. 19:

Flowers large, yellow and brown, very handsome; the middle lobe of lip transversely lozenge-shaped and bifid; anther-bed hairy, with a membranous frill; column-wings ciliated; crest of a pair of diverging lancet-shaped lobes in front, and two smaller at their back.

Wild in Brazil—Hort.

Cf. Walp. Ann. I. 788.

59. *ONCIDIUM TRIPTERYGIUM* Rehb. fl. in B. Z. 1852. p. 694. L. F. p. 19:

Flowers as large as in *O. pectorale*, golden yellow and brown. Dorsal sepal acuminate, lower with two acute lobes. Lip panduriform, with the basal lobes blunt and crisp, the middle one very large, sessile and two-lobed. Anther-bed with a membranous microscopically toothletted border. Crest of lip carinate, toothletted, rather mucicated, with a pair of legs in front. — Rehb. fl.

Wild in Peru; near Loxa—Warszewicz.

Rehb. fl. l. c.:

Perigonii phyllo summo oblongo lanceolato acuto acuminato, infimo a cuneata basi oblongo, apice bilobo, lobis acutis, phyllis lateralibus internis oblongis acutiusculis, sessilibus, quam phyllo summum plus dimidio latoribus, labello panduraeformi, lobis lateralibus basilaribus obtusatis crispulis, lobo medio maximo sessilibus, bilobo, lobis dilatatis rotundatis, gynostemio sat brevi, basi utrinque obtuse alato, superne aptero, cucullo membranaceo microscopice denticulato androclinium cingente, labello basi carinato, carina denticulata, antrorsum bicruri, muriculata.

Blüthen so gross, wie die des *Oncidium pectorale*, goldgelb und braun. Nur vergleichbar mit dem purpurfleckigen *O. cucullatum* Lindl. Dieses hat ganz kurze Hüllblätter, kleine Seitenlappen der Lippe, stark genagelten breiten Mittellappen derselben, eine aufrechtstehende, spitzliche Kappe, nach oben geschulterte, grundständige Säulenflügel. Loxa in Peru.

60. *ONCIDIUM FORBESI* Hooker Bot. Mag. t. 3705. L. F. p. 19:

A very fine plant resembling *O. crispum*, with large brown flowers broken up with yellow near the edges. Its sharp column-ears always banded with lines of violet are

characteristic. In general, the crest consists of five rugged equidistant warts $\begin{matrix} 0 \\ 00 \\ 000 \end{matrix}$ but the two middle ones are sometimes obsolete.

Wild in Brazil; Minas Gerães—Widgren, 770; rare on trees in virgin forests of the Organ Mountains—Gardner, 5872.

Hook l. c.:

Pseudobulbis oblongis sulcatis compressis monophyllis, folio lanceolato coriaceo, scapo paniculato multifloro, sepalis recurvo-patentibus petalisque (duplo majoribus) obovatis undulatis subunguiculatis, labelli disco basi tuberculato-cristato lobis lateralibus parvis oblongis, intermedio maximo flabelliformi, columnae alis parvis angulatis.

Brazil. Organ Mountains, where it was discovered by Mr. Gardner in 1837, and whence it was sent by the same zealous collector to his distinguished patron, his Grace the Duke of Bedford at Woburn-Abbey. Named in compliment of the able Horticulturist, who is in charge of that noble collection.

Among the dried specimens there is only one of this species and that is marked „very rare“ and is numbered 442 of the Organ Mount. Coll. In the Stove of Woburn it bloss. Oct. 38.

As a species it comes near *O. crispum* B. M. t. 3499, but the panicle is much larger bearing more copious flowers; these flowers are very differently coloured and marked: the crest and side lobes, and still more the column present also amply sufficient characters of distinction, the latter being considerably smaller, with very short, angled, by no means serrated wings.

Perigonium flavum marginibus brunneis.

Lindl. B. Reg. XXV. 1839. Misc. 149:

Pseudobulbis ovalibus sulcatis monophyllis, foliis lanceolatis coriaceis, scapo paniculato multifloro, sepalis oblongis obtusis unguiculatis, lateralibus semiconnatis, petalis obovatis duplo majoribus, labelli lobis lateralibus auriculæformibus, intermedio maximo flabellato, cristæ tuberculis 5 carnosis æquidistantibus, columnae alis parvis distantibus.

Brazil. — For a specimen I am indebted to James W. Buller Esq. of Downes near Exeter, who observes that it resembles *O. crispum* more than any of the species he has seen, but is much more beautiful, having petals gaily edged with bright yellow, and some of the sepals barred with the same colour. The plant has a large panicle and very gay appearance. I must however add, that I find the ground colour of the flowers very much browner, than in the figure in the Bot. Mag. in my copy, of which it is brick red. The bidentation of the wings of the column is a variable circumstance, but the appendages of the base of the lip are constantly as represented and described by Sir Wm. Hooker.

61. *ONCIDIUM CRISPUM* Lodd. Bot. C. t. 1854. L. O. p. 197. B. R. t. 1920. Bot. Mag. t. 3499. L. F. p. 20:

Flowers often fifty or sixty in a bending raceme, very large, deep brown, broken up with yellow near the centre. Crest three-lobed, ovate, acuminate, supported closely on either side by straight, smooth, terete warts. Flowers vary in diameter from one and a half to two inches.

Wild in Brazil; on the Organ Mountains on dead trees—Harrison.

62. *ONCIDIUM PECTORALE* Lindl. Sert. Orch. t. 39. L. F. p. 20:

Flowers very large, in an erect spreading panicle, with a brilliant deep yellow lip, and crimson stains on the yellow sepals and petals. Middle lobe of lip flabelliform, deeply two-lobed, with a very narrow base.

Wild in Brazil—Loddiges,

Lindl. l. c. :

Pseudobulbis ovatis compressis sulcatis diphyllis, foliis oblongis obtusis papyraceis, scapo a basi paniculato brevioribus, sepalis lateralibus semiconnatis petalisque obovatis majoribus undulatis, labelli lobis lateralibus nanis, intermedio maximo convexo undulato bilobo, crista ovata depressa acuminata margine verrucosa tuberculisque numerosis circumdata, columnae alae truncatis.

Imported from Rio Janeiro. Habit of *O. Forbesii*, leaves of flexuosum. Pseudobulbs at base and points leaved. Anther very developed. Arrangement of tubercles at the base of the lip is difficult to describe, and may be compared for general appearance to an old-fashioned ladies stomacher, studded with little knots; hence the name. — Flos luteus purpureo pictus.

63. *ONCIDIUM CURTUM* Lindl. in Bot. Reg. 1847. t. 68. L. F. p. 20:

Flowers large brown except the lower half of the lip and some bands on the sepals, which are yellow. The short white crop-eared column with a hairy anther and the lateral tubercles of the crest arranged in a somewhat circular manner, separate this species from all the preceding.

Wild probably in Brazil; its true origin unknown.

Cf. Walp. I. 768. — Lindl. l. c. : At first sight like *O. crispum* and *Forbesii*, but it is, in reality, near *O. pectorale* (the breast plate *Oncid.*). Differs:

- 1) Flowers are smaller,
- 2) There is more brown in sepals.
- 3) There is a broad brown border to the lip.
- 4) The space between the auricles and expanded part of the lip is very short, with parallel edges.
- 5) The auricles are broader.
- 6) The tubercles of the crest are much more broken up and differently arranged.
- 7) The anther is downy.
- 8) The lateral sepals united to the point.

64. *ONCIDIUM HAEMATOCHRYSUM* Rehb. in Linn. XXII. 844. (1849): L. F. p. 20 :

Pedunculus gracilis superne furcatus (nunc pluriramosus?), partitione utraque pauciflora (3—5), sepala obovata acutiuscula, lateralibus connatis, apice bidentatis. Petala sepalo supremo subaequalia. Labellum panduratum, parte basilari quadratum, unguiculatum, auricula lanceolata, obtusiuscula in utroque angulo posteriore; crista crassa gyrosa, nunc in tres partes sulcis 2 transversis divisa; callis 4—6 minutis papillaribus in utroque latere, parte mediana labelli constricta, antica transversa rotundata, antice biloba, lobo utroque nunc bi-trilobulato; columnae alae subquadratae, margine externo denticulatae. — Such is the more important part of description given by Rehb. fil. I have seen no specimen or sketch. Flowers handsome, golden yellow and crimson, with the exception of the column-wings. I can't distinguish it from *O. curtum*.

Wild in Brazil; near Rio Janeiro, whence it was sent to Count Hoffmannsegg, with whom it bloomed in 1841. — Rehb. fil.

Obs. *O. ochmatochilum* Rehb. fil. conf. ex Lindl.

64 b. *ONCIDIUM FLABELLIFERUM* Pinel Paxt. Mag. XVI. ad pag. 65. cf. Walp. Ann III. 555.

Huc: *Oncidium flabelliferum* Pinel MSS. Paxt, Mag. XVI. p. 66 :

Plant an epiphyte. Pseudobulbs two inches or more long, having from one — 3 leaves at the extremity of each. Leaves erect, lanceolate. Flower scape one foot to eighteen inches long, many flowered. Sepals and petals ovate lanceolate rounded, wavy at the edges, thickly spotted and striped with purplish brown; much after the manner of the flowers of *Oncid. tigrinum*. Labellum large, spreading, fan-

shaped, curled at the margins, twolobed, of a bright yellow colour, thickly spotted on the lower margin with purple brown.

Cyrtoclitum citrinum Hooker in B. M. t. 4451.

Oncid. unguiculatum Klotzsch in Allg. Gartenz. XVII. 91.

This is one of the handsomest of the genus, on account of its large rich whole-coloured yellow flowers, by which and its ovate retuse lip it is immediately recognised. Its origin is doubtful. On the authority of the Woburn collection Sir W. Hooker reported it to have been found on the Organ Mountains by Gardner; at a later period Central America was given to it upon the assurance of Mrs. Lawrence's gardener. Neither source of information is trustworthy. I have seen nothing like it in the multitudes of wild specimens that have passed under my observation. In a

memorandum in my herbarium Mr. Bateman reports, that it exists in the Royal Berlin Collection, Nr. 4049, where is a specimen gathered in Brazil by Sellow.

Wild in Brazil; Mexico? — Klotzsch.

Hook. B. M. 3757: *Oncidium concolor* Hook.

Bulbo ovato, foliis binis ligulato-lanceolatis, scapo radicali racemoso, sepalis lateralibus fere ad medium unitis, labello trilobo basi bilamellato lobo medio bifido.

Brasilia. Flores flavissimi.

Lindl. Sert. 48: pseudobulbo ovato diphylo, foliis ligulato lanceolatis racemo erecto brevioribus, sepalis petalisque lanceolatis conformibus, lateralibus semiconnatis, labello unguiculato ovato obtuso emarginato medio constricto basi bilamellato longiore, columnae alis rectis truncatis.

Brazil. Colour pure yellow, without any spots.

Hook. B. M. 4458: *Cyrtochilum citrinum*:

Pseudobulbis brevibus ovatis sulcatis apice diphyllis, foliis lineariblongis acutiusculis, scapo radicali foliis multo longioribus, racemo simplici 8 — 10floro, bracteis parvis ovato-lanceolatis acuminatis, labello subduplo brevioribus, petalis ovatis subundulatis sepala subaequantibus, labello maximo subrotundo panduraeformi basi attenuato bilamellato, columna utrinque unidentata.

Habit of *Cyrtochilum filipes* B. R. 4159. (*Oncid. Wrayae* Hook. Bot. Mag. 3354.) Central-America.

Obs. Synonymon: *Oncid. unguiculatum* Klotzsch false huc ducitur. Est ipsissimum *Oncid. unguiculatum* Lindl. quod = *O. Barkeri* Lindl., quod = *O. tigrinum* Llav. — R. f.

66. ONCIDIUM COCHLEATUM Lindl. Sert. Orch. sub t. 25. L. F. p. 21:

Of this I have only seen a flower-stem with half-a-dozen densely packed flowers, less than an inch in diameter.

Wild in Peru; Paramo de Suraguru—Jamieson.

Lindl. l. c.:

Pseudobulbis folisque —, bracteis oblongis membranaceis obtusis, floribus densis, sepalis lateralibus semiconnatis petalisque lanceolatis acutis conformibus et concoloribus, labello unguiculato concavo obovato acuto basi bilamellato tuberculo parvo infra medium tribusque denticulis interjectis, columnae alis angustis bifidis inflexis.

Paramo de Suraguru. Quito. Jamieson.

67. ONCIDIUM AUREUM Lindl. Sert. Orch. sub t. 25. L. F. p. 22:

Odontoglossum festatum Rehb. fil. in Bonpl., Ap. 1854.

(A.) Lip as broad as long. Crest of two vertical plates, emarginate in the middle with an intermediate equidistant teeth.

(B.) *stenochilum*. Lip longer, than broad. Crest of two vertical plates, emarginate in the middle, with an intermediate tooth.

Odont. hemichrysium Rehb. fil. in Bonpl. Ap. 15. 1851.

Braets glumaceous. Flowers one inch and a half apart, in an erect, loose, stiff panicle; apparently with a golden yellow lip, and olive-coloured sepals. The plant must be in cultivation, good healthy specimens having been sold by Mr. Stevens in 1853. The differences in the crest and form of lip between the two varieties are very remarkable.

Wild in Peru; A. high mountains near Andimarca—Mathews, {1068; B. sources of the Marannon—Warszewicz.

Lindl. Sert. l. c.:

Pseudobulbis — —, foliis binis lanceolatis acuminatis obtusis, scapo

paniculato ramis flexuosis, bracteis magnis membranaceis spathaceis, sepalis lateralibus semiconnatis petalisque ovatis acutis, labello cordato cuneato rotundato unguiculato, margine unguis utraque bidentata setulis 5 interjectis, alis columnae acinaciformibus laceris.

In montes altos prope Andimarcam. Matthews 1068.

Sert. 48: Flowers apparently with yellow lip and green sepals and petals. Lofty mountains of Andimarcha.

Huc: *Oncidium* (*Xanthoglossum*) *festatum* Rehb. fil. v. Warscew. in Bpl. II. 100:

Aff. *O. bicolori* sepalis lateralibus ima basi connatis, labello cordato pandurato. — Pedunculus racemosus seu subpaniculatus, nunc superne ilexuosus, bracteae ovatae acutae cucullatae ovaria pedicellata dimidio seu tertia parte aequantes, sepalum summum oblongum apiculatum (undulatum ex sicco), sepala lateralia subaequalia basi connata, tepala sepalo dorsali subaequalia, labellum breviter unguiculatum, dein a cordata basi panduratum, portio anterior postica duplo latior, antice lobulata medio apiculata, discus subvelutinus, carinulae serrato dentatae 3—5 (dentibus 3—5) in ungue ac laminae basi, gynostemium humile, alae lineares, descendentes, apice ciliatae.

Blüthen zwei Mal so gross, als die des *O. mystacinum*, Hüllblätter rothbraun. Lippe goldgelb. Wir hielten diese Art früher für *Odontoglossum bicolor* Lindl., allein dieses hat ein labellum unguiculatum basi cuneatum, auch ist von verwachsenen seitlichen Sepalen keine Rede. Palca in Peru. Ruiz and Pavon 1794.

67b. Judice Rehb. fil.: *ONCIDIUM HEMICHRYSUM* Rehb. fil. Mss.: (*Odontoglossum* (*Xanthoglossum*) *hemichrysum* Rehb. fil. Warzw. Bonpl. II. 100:

Aff. *Od. mystacino* sepalis lateralibus semiconnatis, lamellis 2 in ungue, tribus abbreviatis in basi laminae antepositis, lateralibus bilobis, gynostemii brevissimi alis apicularibus ligulatis fimbriatis.

Racemus gracilis, nunc ramosus, bracteae ovatae acutae seu lanceolatae acutae ovarium pedicellatum sub anthesi dimidio seu tertia imo quinta parte aequantes, sepalum dorsale oblongum acutum apiculatum, lateralia subaequalia, apiculata, dimidium usque connata, labello supposita; labellum unguiculatum a cordata basi panduratum, apice latius, quam basi, apice bilobum; lamellae 2 pronae in ungue, cristulae minutae antepositae adjectis 2 denticulis utrinque, nervi 3 medii (in sicco!) satis prominuli, gynostemium humile, alae apicales, ligulatae productae, fimbriatae (toto margine anteriori). Hüllblätter rothbraun, Lippe goldgelb. Pseudobulben zweiblättrig. Blätter schmalzungig nach Skizze, kürzer als Blütenstiel. Peru. v. Warscewicz. Nächst *O. mystacinum* Lindl., Rehb. fil. Diese Art hat eine längere Säule, kürzere Flügel, eine anders gestaltete Lippe und ganz gelbe Blüten.

(68. *ONCIDIUM DECIPIENS* Lindl. cf. *Oncidium crista galli* Rehb. fil. N. 96.)

69. *ONCIDIUM CUCULLATUM* Lindl. Sert. sub 21. L. F. p. 22:

(A.) *maculosum*. Raceme many-flowered, nodding. Lip violet spotted with purple, with small auricles. Sepals and petals deep-red.

(B.) *sanguinolentum*. Raceme few-flowered. Lip rose-colour, crenulated, spotted with crimson, with auricles wider than the middle lobe. Sepals and petals green, with a few crimson streaks.

Leochilus sanguinolentus Lindl. in Bot. Reg. 1844, Misc. 91.

(C.) *spathulatum*. Raceme many-flowered, nodding. Lip spotted only at the base, which is narrower, than the middle lobe. Sepals and petals spotted.

(D.) *nubigenum*. Raceme few-flowered, erect. Lip narrow at the base, with a lobed and nearly sessile middle division, without spots, as well as the sepals and petals.

O. nubigenum LO. p. 197.

(E.) *macrochilum*. Raceme many-flowered, very flexuose. Lip whole-coloured, one inch and a half broad.

A most variable plant, of which D. is, I now doubt not, merely an alpine form, in which the crest consists of three rounded tubercles; in C. the tubercles are acute, and there are two minute additional teeth on each side; in B. there are three tubercles, the middle one of which is very small, and the laterals abruptly rostrate; in A. there are three only, and acute; in all there is a tuft of hairs at the foot of the column, on the crest. The leaves are equally changeable; in A. they vary from oblong to narrowly lorate, and in C. they are spatulate. In the colour and size of the flowers differences are equally abundant. All are very handsome, most especially E., which is by far the finest Alpine Orchid yet discovered.

Wild in Peru and New-Granada; A. in the province of Mariquita, in the forests of Quindiu, at the height of 870, where it is called Hierba Buena and La Mesa-Linden, 1287; trunks of trees on the western declivity of Pichincha—Jamieson; Soto, at 6000 to 7500 ft. — Schlim, 1004; las Velas, at 10,000 ft. — Schlim, 1726; Soto, Ocanna, etc. at 7500 to 9000 ft. on the Sierra Nevada of Sa. Martha—Schlim, 411; Sa. Martha—Purdie; B. La Guayra—Barker; C. Peru—Wm. Lobb; D. Woods of Machache near Quito, at 11,000 ft. — Hartweg; ridge of Assuay, but only on the W. side, which to a certain height is clothed with forest trees, at 11,000 ft. — Jamieson; E. Quitinian Andes, on trunks of trees, at 13,000 ft. — Jamieson.

Huc: *Oncidium cucullatum* Lindl. Sert. sub 21:

Pseudobulbis foliisque —, scapo paniculato angulato bracteis squamiformibus cartilagineis concavis acutis sepalo supremo oblongo, inferioribus omnino connatis petalisque ovalibus carnosissimis planis, labello cordato panduriformi apice maximo lunato transverso appendice lanceolata apiculato, tuberculo baseos ovato subtridentato, columna nana basi auriculis rotundatis marginata, clinandrio cucullato.

In arboribus ascensus occid. montis Pichincha. Jamieson.

Sert. sub 48: Flowers apparently purple with small spots.

Orch. Lind. p. 14: „An epiphyte with oval obtuse ribbed pseudobulbs. This magnificent species has deep red petals and a two-lobed violet lip spotted with purple. Forests of Quindiu, 7800—8700'. The Gallegos call it Hierba buena and la Mesa. Nr. 1287.

Huc: *Leochilus sanguinolentus* Lindl. Bot. Reg. XXX. 1840. Misc. 91:

Labello pandurato sepalis multo majore apice bilobo, laciniis subrotundis imbricatis superficie plana laevi supra basin 3-tuberculata basi ipsa villosa, columnae alis abbreviatis, clinandrii dorso elevato, anthera parva.

This also comes from La Guayra, whence Mr. Barker received it. Although the flowers are small, they are very beautiful, having a deep crimson lip, richly studded with clear purple spots. In the smallness of its anthers, the extension of the anther bed [behind into an elevated rim, and in the shortness of the column wings, it is somewhat different from the rest of the genus. I have only seen a couple of flowers.

Huc: *Oncidium cucullatum* Lindl. Paxt. Fl. G. III. t. 87:

Pseudobulbis ovalibus obtusis costatis elongatis, foliis oblongo lanceolatis planis scapo angulato aequalibus, racemo simplici vix paniculato, bracteis parvis concavis squamiformibus, sepalo supremo petalisque ovalibus, subherbaceis aequalibus, lateribus in unum oblongum concavum bidentatum connatis, labello cordato panduriformi apice dilatato bilobo laciniis rotundatis subdentatis divaricatis lamellis brevibus laevibus rotundatis pone basin serie solitaria villosam, columna nana auriculis brevibus rotundatis juxta basin marginata, clinandrio carnoso cucullato.

O. cucullatum Lindl. Sert. sub 21. Orch. Lind.

Leochilus sanguinolentus B. R. 1844. Misc. 91.

First knowledge we had of it in a live state was from a couple of wretched flowers sent us by the late M. Barker, when it was supposed to be a *Leochilus*.

O. nubigenum Lindl. in Hook. B. J. I. 13. 14. (1834): Found August 1831 on the ridge of Assuay, growing upon the trunks of decayed trees; most commonly a single leaf springing from the bulb, but occasionally 2. The scape bears from 3—10 flowers of pale purple colour. „Of all the Orch. I have seen, this species is, perhaps, the one that occurs at the highest elevation, rarely descending below 14000 feet“ Prof. William Jamieson.

Rehb. fl. Bonpl. III. 66. Ocanna 6—7000'. Wagener. Rehb. l. c. II. 279: Ocanna. Wälder. 8—10,000'. Januar. 411. Schlim. Lem. Jard. Fl. III. t. 317. Van Houtte Fl. Serres VIII. 835.

70. ONCIDIUM PUBES LO. 199. B. R. t. 1007. B. M. t. 3926. L. F. p. 23:

O. bicornutum Bot. Mag. t. 3109.

Flowers small, in a pyramidal panicle, brown, edged, with yellow, or chiefly yellow with crimson streaks and stains.

Wild in Brazil; in thin forests round the table-land of Bom Jesus de Bananal—Descourtilz; Miers.

Huc: *Oncidium bicornutum* Hook. l. c.:

Bulbo elongato diphylo, scapo radicali, panicula densa, perianthio tetraphyllo foliolis obovatis subaequalibus, labello angulato-lobato lateribus apiceque reflexis, disco tuberculato, columna pubescente, anthera cornubus duobus mollibus reflexis.

Mr. Harrison Esq. of Rio sent it to his sister Mrs. Arnold Harrison of Aigburgh, near Liverpool. — Perigonium flavum, purpureo maculatum.

Hook. Bot. Mag. l. c. 39267. *Oncid. pubes* Lindl. var. *flavescens*: Different as the flowers of this plant appear at first sight from those of *Oncidium pubes* as figured in the Bot. Reg. they exhibit the same form and structure. The dissimilarity exists only in colour, and I have the authority of Dr. Lindley himself for considering it specifically the same. The original species has the sepals of a much greener tinge and the middle lobe of the lip margined with red. — A native of Brazil first detected there by Mr. Douglas, and since found in the Organ mountains by Gardner, whose flowering plant, grown in the Glasgow Bot. Gard., is here represented. 1839/10.

71. ONCIDIUM UNICORNE Lindl. B. R. 1839. Misc. 76. L. F. p. 23:

O. monoceras Hooker Bot. Mag. t. 3109.

Panicle thin, straggling. Flowers small, pale yellow.

Wild in Brazil; Minas Geraës—Regnell.

Lindl. l. c.:

Pseudobulbis ovalibus compressis diphyllis, foliis oblongo-linearibus recurvis, racemo composito ramis divaricatis rectiusculis, sepalis lateralibus in unum concavum emarginatum connatis, petalis obovatis undulatis, labelli lobis lateralibus nanis intermedioque emarginato rotundatis, disco basi transverse elevato antice cornu ascendente compresso subfalcato acuto, alis columnae angustis obsoletis.

This is a pretty little species, with a compound straggling raceme of pale yellow flowers. The singular horn on the lip, to which it owes its name of the „Unicorn“ at once distinguishes it from all species previously described. Messrs. Rollisons imported it from Rio.

Hook. l. c. 3169:

Pseudobulbo oblongo compresso sulcato uni- — bifolio, foliis oblongo-lanceolatis coriaceis nitidis, floribus paniculatis, sepalis (viridibus)

lanceolatis inferioribus coadunatis, petalis obovato-spathulatis, labello trilobo, disco cornu elongato sursum curvato, columna gracili elongata aptera.

Sent by Mr. Hunt from Rio Janeiro to his Grace the Duke of Bedford Sept. 39. Flowered 1840(1.)

We know another horned species, which flowered at Glasgow in the autumn of last year, sent from the Organ Mountains by Mr. Gardner, which has a horn very similar to this: but it is in other respects very different, especially in the presence of 2 blunt, horn-shaped processes on the column.

Etiam in Knowles and Westc. Floral Cab. II. 1838. p. 143.

72. ONCIDIUM INCURVUM Barker in Bot. Reg. Misc. 174, 1845, t. 64. L. F. l. c. p. 23 :
O. alboviolaceum Rich. and Gal., Orch. Mex.

Flowers small for the genus, white banded with purple, sweet-scented, much like those of *O. ornithorhynchum*.

Wild in Mexico; Talea in the province of Oaxaca, at 4—5000 ft. very rare — Galeotti, 5021.

Lindl. l. c. :

Pseudobulbis ovatis ancipitibus utrinque tricostatis diphyllis, foliis ensiformibus acutis, scapo elongato racemoso-paniculato, sepalis linearilanceolatis undulatis liberis, petalis conformibus incurvis, labelli laciniis lateralibus rotundatis nanis intermedia subrotunda concava acuta, crista ovato depressa dimidio inferiore lineata superiore tricostata, columna subaptera.

A pretty species with pale pink flowers mottled with white. It has at first sight the appearance of *O. ornithorhynchum*, but it wants the birds beaked anther and the column-wings of that species. Its panicked scape is long, narrow, and about 3' high. Barker and Lee & Comp. of Hammersmith.

O. alboviolaceum Rich. et Gal. tab. 33. Ann. sc. nat. 1845. p. 27 :

Pseudobulbis compressis oblongis sulcatis diphyllis, foliis lanceolatis acutis; scapo paniculato; floribus albis violaceo-maculatis, gynostemio hinc et illinc bialato, alis latis, truncatis, sinuosis. Mexico.

73. ONCIDIUM BIFOLIUM Sims in Bot. Mag. t. 1491. B. C. t. 1845. L. O. p. 197. L. F. p. 23 :

This appears to be one of the plants brought to Montevideo by Indians from the country to the northward, and used in that city for the decoration of balconies; with its precise habitat I am unacquainted. Flowers large, yellow, with rich brown bars on the sepals and petals. Raceme nodding, 8—10-flowered.

Wild near Montevideo—hort.

74. ONCIDIUM MARTIANUM Lindl. in B. Reg. sub t. 1920. L. F. p. 23 :

(A.) Flowers whole-coloured.

(B.) *bicolor*. Sepals and petals and base of lip spotted with brown. *O. bicolor* Bot. Reg. t. 66. 1843.

The two varieties differ only in colour; both have bright yellow flowers, almost white at the back. They form, when vigorous, a great branching panicle. The lateral sepals are joined at the base, but only for a short distance. The figure of *bicolor* in the „B. R.“ is from a poor weak specimen; the two elevated lines below the middle tooth of the crest are not sufficiently elevated or tooth-like at the base.

Wild in Brazil; woods in the province of Mines—Martius.

Lindl. l. c. :

Pseudobulbo —, foliis —, scapo erecto paniculato, sepalo supremo petalisque obovatis obtusis concavis lateralibus linearibus acutis brevioribus, labello bilobo reniformi, laciniis lateralibus rotundatis nanis, crista falcata compressa utrinque tuberculis 3-linearibus, $\frac{2}{1}$ -suffulta, alis columnae denticulatis subquadratis angulis rotundatis.

In Brazil. Von Martius.

A beautiful yellow species with a scape 2 feet high; it resembles in general appearance *O. ampliatum*. B. R. XXIII. 1837. sub 1920.

O. bicolor Lindl. Bot. Reg. XXIX. 66 :

Pseudobulbis ovalibus compressissimis utrinque tricostatis, folio solitario oblongo sessili striato, panícula divaricata, sepalis lateralibus basi connatis petalisque ovatis acutis, labello maximo bilobo, disci tuberculo hastato tripartito, columnae alis rotundatis dentatis.

Spanish Main. Loddiges Cat. 1243. Flowered 1842. Sept. Affinity *O. bifolium*.

Perigonium sulphureum purpureo pictum labello extus albo.

Lindl. Orchid. Lind. p. 14: „not in herb. Linden.“

75. *ONCIDIUM MACULOSUM* Lindl. in Bot. Reg. sub t. 1920. L. F. p. 24:

Leaves two, lanceolate, four to five inches long. Scape nearly two feet high, with a small, somewhat paniced raceme. Lip about an inch broad.

Wild in Brazil; in the province of Mines—Martius.

Descriptio Lindleyi: Pseudobulbis ovalibus compressis, foliis lanceolatis acutis, scapo stricto maculoso apice paniculato, sepalis ovalibus acutis reflexis, lateralibus basi connatis, petalis oblongis obtusis, labello maximo basi pubescente obsolete quadrilobo reniformi, laciniis lateralibus minimis auriculæformibus, crista oblonga e tuberculis pluribus digitiformibus constante, columnae alis inferioribus truncatis, superioribus falcatis integerrimis majoribus.

Brazil. Von Martius.

A fine spec. in the way of *Oncidium bifolium*.

Lindl. Sert. 48: In the way of *Oncidium bifolium*, but with an erect slightly branched raceme. It has flowered with Mr. Barker of Birmingham.

76. *ONCIDIUM BLANCHETI* Rehb. fl. in Linnaea XXII. 1845. L. F. p. 24:

A grass-leaved plant, with a close cylindrical erect raceme of small flowers. Bracts somewhat glumaceous, not more than one line and a half asunder. The crest consists of five excessively rugged tortuous lines near the base, as many shorter and broad-ended ones of the same character in front, and a couple of little tubercles at a short distance on each side.

Wild in Brazil; Bahia—Blanchet, 3343, (f. Rehb.); Minas Gerões—Widgren, 772.

Cf. Walp. Ann. III. 555.

77. *ONCIDIUM VIPERINUM* LO. p. 197. L. F. p. 24:

O. confragosum Lindl. in Bot. Reg. 1838. Misc. 92.

Lip much smaller, than in *O. bifolium*, and the crest quite different. Flowers pale straw-colour. Misled by Garden inaccuracy I was led to make out of this another species, *O. confragosum*, falsely said to be Mexican.

Hook. B. J. I. 13: Lindl.: Another species was accidentally mixed up with the Peruvian Orchideae, and therefore, we insert it from Mrs. Lindley's MSS. in a note:

O. vip. Diagn. sequitur = LO. 107. „Gen. et Sp. Orch. part. 3 ined.“

Only found on the back of very old trees and requires more nourishment than any of the other species. Paraguay. Mr. Tweedie.

Oncidium confragosum Lindl. B. R. XXIV. (1838.) Misc. 92:

Pseudobulbosum, scapo simpliciter glaucescente apice nutante, sepalis ovatis acuminatis undulatis lateralibus semiconnatis, petalis majoribus oblongis undulatis acutis, labelli lobis lateralibus nanis recurvis intermedio unguiculato alte bilobo subangulato reniformi disco maximo digitato confragoso, columnae alis rotundatis denticulatis.

A nat. of Mexico, imp. George Barker, Esq. Flowers just the same colour as *O. stramineum*, for which the spec. might be mistaken upon a casual examination. The colour is a very delicate straw, faintly spotted with pale purple.

78. *ONCIDIUM DISCIFERUM* Lindl. Fol. p. 24:

O. folio oblongo apiculato, scapo a basi paniculato panicula pyramidali, sepalo inferiore bilobo, petalis obovatis acutis, labelli lobo medio subrotundo-reniformi apiculato lateralibus semicircularibus, crista oblonga discoidea dentibus 3 antepositis aliisque minutis circumstantibus, columnae alis minutis triangulis obtusis sub lente pruinosis.

Whole plant a foot high. Pseudobulbs oblong, ribbed. Flowers apparently with a yellow lip, and olive-green whole-coloured sepals and petals.

Wild in Bolivia—Bridges.

79. *ONCIDIUM VARICOSUM* Lindl. in Bot. Reg. sub 1920. Journ. of Hort. Soc., V. 143. Lindl. F. sub p. 24:

A glaucous strong-growing species, of considerable beauty. The leaves are firm and ligulate-lanceolate. The scapes, which are strong, very glaucous, and about three feet long, have a great branching panicle, loaded with from eighty to ninety large showy flowers. The sepals and petals are pale dull green banded with dull brown. The lip is large, very bright yellow, with two ovate lateral ears somewhat crenate in front, and a four-lobed middle lobe. The crest consists of two triple teeth, one standing before the other, and of a little ring of varicose veins placed on each side of it. The wings of the column are oblong, whole coloured, and finely notched.

Wild in Brazil—Prince Max. of Wied Neuwied in hb. Martius.

Lindl. B. R. I. c.:

Pseudobulbis subtetragonis diphylis, foliis rigidis spathulato-lanceolatis, scapo gracili pyramidali subsimpliciter racemoso brevioribus, floribus distantibus petalis sepalisque quorum lateralia semiconnata acutis reflexis, labello maximo subrotundo obsolete quadrilobo, lobis lateraliibus rotundatis crista postice tridentatis fornicata antice cuneata varicibus venarum in posticis confluentibus circumdata, alis superioribus columnae rotundatis denticulatis, inferioribus integerrimis.

Brazil, Prince Maximilian of Wied Neuwied. — A fine species in the way of *O. bifolium*, but with large spreading compund racemes.

Sert. sub 48: alis columnae rotundatis denticulatis. Flowers appear wholecoloured. — G. Chronicle 1850. 168: = *Oncidium Lunaeum*.

Lindl. Paxt. I. 106 Lindl. Journ. et Hort. soc. V. 143: Scapes covered with a glaucous bloom. Flowers bright yellow. Considerable beauty. Leaves firm, ligulate lanceolate; scape strong, about 3 feet long. panicle with 80–90 large flowers. Sepals and petals are pale dull green banded with dull brown. Lip is large, very bright yellow, with 2 ovate lateral ears, somewhat crenate in front, and 4 lobed central portion. Crest consists of 2 triple teeth one standing before the other, and of a little ring of varicose veins, placed on each side. Wings of column are oblong, whole coloured, finely notched.

Lemaire Jard. Fl. tab. 206. 207.

80. *ONCIDIUM ISOPTERUM* Lindl. in Bot. Reg. sub t. 1920. L. F. p. 25:

This should be re-examined. My sketch of the original specimen represents a plant with two recurved channelled leaves about three inches long, a scape about five inches long, where it forks into two unequal flexuose racemes. The flowers are very like those of *O. flexuosum*, except in the crest, which seems to be formed of one great central tooth and several smaller ones on each side, without any pulverulent cushion at the base. The sepals are acute, not obtuse, and the wings of the column which are rounded, as in *O. flexuosum*, are of nearly the same size as the two cheeks at the base of the column, which are themselves, in the original definition, called additional wings.

Lindl. ex Bot. Reg.:

Pseudobulbis ovalibus compressis diphyllis, foliis angustis canaliculatis recurvis scapo apice paniculato flexuoso quadruplo brevioribus, sepalis acutis supremo fornicato, lateralibus semiconnatis divaricatis, petalis obovatis reflexis, labelli laciniis lateralibus brevibus angustis obtusis intermedia transversa angulata biloba, crista tuberculosa, columnae alis 4 subaequalibus rotundatis.

Brazil. Von Martius.

A small species very near *O. flexuosum*.

Sert. Orch. 48: Inhabits elevated open places on the Serra de Gran Mogol.

81. *ONCIDIUM FLEXUOSUM* Sims in B. M. t. 2203. LO. p. 199. L. F. p. 25.

Flowers bright yellow with clear brown spots, in a large branching panicle. It varies much in the size of the flowers, and also in the condition of the crest, which is, however, always cushion-shaped and downy or pulverulent at the base. In front of the cushion are sometimes three small ridges, in other cases four teeth are interposed between them and the cushion; in others there are a few off-lying warts. I have never met with the ridges fingered as represented in the „Bot. Mag.“

Wild in Brazil—Miers, 3479. etc.

Oncidium flexuosum Lodd. β . *citrinum* Rgl. Index Semin. Pétrop. 1855.

Labellum sulphureum immaculatum. Cetera ut genuini.

82. *ONCIDIUM HAEMATOXANTHUM* Rehb. fl. in litt. L. F. p. 25:

Under this name I have from Prof. Rehb. a sketch of the flowers of a species said to be near *O. flexuosum*, but by no means the same. The flowers seem to be the size of *O. isopterum*, but the middle lobe of the lip is almost sessile; the base „purplish with yellow calli.“

82b. *ONCIDIUM ECHINATUM* H. B. Kth. N. Gen. et Sp. I. 3445. 79. Huc: *Erycina echinata* Lindl. Fol. I. Jan. 6. 1853:

Sepala subherbacea, aequalia patentia, lateralibus basi connatis. Petala omnino conformia. Labellum maximum, petaloideum, tripartitum, circa columnae basin adnatum; laciniis aequalibus, auricula carnosa inter columnam sinumque utrumque; basi appendice bilingui auctum. Columna nana, semiteres, brachio carnoso (staminodiis) utrinque; postello elongato sigmoideo. Pollinia 2, subrotunda, postice excavata; caudicula lineari subulata; glandula ovali. Anthera membranacea, unilocularis, longe rostrata. Herba epiphyta, Americae tropicae, ebulbis. Folia pauca, radicalia, disticha, coriacea, acuta. Panicula terminalis, racemosa; bracteis squarrosis, amplexicaulibus. Ovaria ramentaceo-echinata.

Excellent specimens of this extremely rare plant, with which I have been favoured by M. Galeotti, show, what has long been suspected, that it is not an *Oncidium*; from which genus it is separated by its dwarf column, long sigmoid rostellum, and the very large fleshy column-arms, which evidently represent the lateral inner abortive stamina of *Zygostates*, and the two arms of *Leochilus*. It differs from the former genus in the column-arms not being free, in its large peculiar lip, and its minute petals; from *Leochilus* in its long sigmoid rostellum, and peculiar lip, and from *Ornithocephalus*, to which it approaches, in the remarkable arms of the column, and two pollenmasses instead of four. The lip has the following unusual structure; it grows nearly round the column, and adheres to all that it surrounds; at the base next the column stands on either side a little fleshy ear, which arises from within the edge of the lip, and a similar, but smaller, ear is produced within and above each anterior sinus of the lip. The analogy of these intermediate ears is not obvious.

Erycina echinata Lindl. F. p. 1:

The figure in H. B. K. is tolerably characteristic, as a general representation. My specimens are about nine inches high, with leaves like those of *Ionopsis utricula-*

rioides. The scape is polished like a bamboo; the bracts are completely amplexicaul, with diverging acute points. The lobes of the lip, which resembles that of *Tetramiera*, are rounded and entire. The whole plant has the aspect of an *Ionopsis*.

Wild in Mexico; on the west coast near Acapulco, in the hottest region, flowering in May—Humboldt and Bonpland; at the Laguna de Tututepeque, in the province of Oaxaca, at the elevation of 4000 feet, in April—Galeotti, 5359.

82 c. *ONCIDIUM MACRANTHERUM* Hook. B. Mag. 3845:

Pumilum pseudobulbis ovatis compressis monophyllis, pedunculis subtrifloris folio brevioribus, petalis sepalisque ellipticis conformibus, labello ovali apice emarginato lateribus deflexis disco elevato pubescente basi bituberculato, columna brevi basi utrinque longe calcarata, rostello producto, anthera (magna) ovato-acuminata.

Perigonium flavido viridulum, labello purpureo picto; perigonii phyllis basi purpureis; labelli callis flavis.

Interior of Mexico. Galeotti. Sent by Parkinson to the Woburn coll. April 1840.

It may rank near *O. pumilum*.

Lindl. Bot. Reg. XXVII. 1841. Misc. 33:

This plant possesses no beauty, even when represented upon paper. It is either a bad specimen of *Leochilus oncidoides* of Knowles and Westcott, or a species so nearly allied, that I am not at present able to point out the diff. between them. With *Oncid. carinatum* and another species or two it forms a group readily known by *Oncidium* proper, by the large anther, the two armed column, and some peculiarities in the lip. If it should be eventually separated from *Oncidium* which seems probable, the name of *Leochilus* although not very appropriate, must be retained for it.

Huc: *Leochilus* Knowles and Westcott Fl. Cab. II. 1838. 143:

Perianthium connivens, sepala lateralia basi connata, petala conformia, labellum columna continuum integerrimum, columna nana basi alata, gynizus subquadratus, clinandrium marginatum, rostratum, pollinia 2 globosa, cavata, anthera unilocularis. Caudicula linearis. Glandula minuta.

Very nearly related to *Oncidium* particularly to *O. carinatum* from which it principally differs in having smooth, not a tuberculated or crested label. It is a native of Mexico, and is in the collection of G. Barker.

Bot. Reg. XXVIII. 1842. Misc. 22:

In many respects it is extremely like *Rodriguezia*, and its habit is not at variance with that genus, but there are some circumstances that distinguish it. In the first place, the lip is not parallel with the column, and secondly the two arms of the column proceed from below the stigma and not from the upper edge of that organ. In addition to this the anther is disproportionally large as compared with the column, and there is a honey pore near the base of the lip. From *Oncidium* this genus is well distinguished by the position of the arms of the short column, and the honey pore.

B. R. XXVI. 40. Misc. 218. *Rodriguezia maculata* Lindl.:

Racemis nutantibus basi laxe et distanter vaginatis, sepalo supremo cum petalis acuto lateralibus basi tantum connatis paulo brevioribus, labello oblongo convexo retuso secus axin depresso infra medium crista pubescente utrinque elongata aucto basi 4-dentato, columna brevi utrinque brachium protrudente.

Guatemala. Skinner. Bateman.

Small flowers, faintly spotted with red, and has no beauty.

B. R. 1842. Misc. 22: *Leochilus oncidoides* Knowles and Westcott.

Rodr. mac. Lindl. B. R. 1840. Misc. 18. *Oncid. macranth.* Hook. B. Mag. 3845.

Racemis nutantibus foliis subaequalibus basi laxe et distanter vagi-

natis, sepalis lateralibus basi tantum connatis, labello oblongo convexo retuso vel apice angustato rotundato secus axin depresso, infra medium crista pubescente utrinque elongata aucto basi mellifero.

Mexico and Guatemala.

Flowers spotted with purple on a dirty transparent ground.

82 d. ONCIDIUM LABIATUM Rehb. fil. Mss. Huc *Epidendrum labiatum* Sw. Ind. occ.....

Leochilus cochlearis Lindl. Bot. Reg. 1842. Misc. 22. (*Rodriguezia cochlearis* Lindl.

Ann. nat. Hist. IV. 116):

Foliis oblongis sessilibus horizontalibus, racemo erecto radicali subcorymboso paucifloro duplo brevioribus, sepalo supremo cum petalis obtuso, lateralibus acutis semiconnatis brevioribus, labello obovato cochleari obtuso basi crista hippocrepica utrinque elongata bicarinato.

Dominica.

Flowers apparently yellow.

83. ONCIDIUM SCANSOR Rehb. fl. in Linn. XXII. 8441 L. F. p. 26:

O. convolvulaceum Lindl. in Paxt. Fl. Garden, Vol. I. under t. 21.

This has the twining stem of a Convolvulus. Flowers solitary, two inches in diameter, with a large yellow lip.

Wild in New-Grenada—Warszewicz; near Ocanna, at the height of 5400 ft.—Schl., 1013; Venezuela—Fünck and Schlim, 1444.

Cf. Walp. Ann. III. 555. — *Oncidium convolvulaceum* Lindl. Paxt. Fl. G. I. 102:

Rhizomate volubili filiformi, pseudobulbis secus rhizoma distantibus compressis subrotundis monophyllis, folio plano sessili ovato oblongo obtuso mucronulato, pedunculis basi squamatis unifloris folio subaequalibus, sepalis liberis petalisque latioribus oblongis acutis patentissimis, labello maximo bilobo baseos auriculis linearibus apice dilatatis, rotundatis, crista elevata truncata utrinque lobata verrucis duabus a fronte, columnae alis acutis truncatis.

Venezuela 1444. Funck and Schlim. Habit of *Bolbophyllum* agreeing in that with *O. serpens*. On a hard twining rhizoma appear at the distance of 3—4 inches one-leaved pseudobulbs usually springing from the axil of a small leaf. These pseudobulbs are thin, nearly round, scarcely an inch long, and each bear a solitary flat leaf about 2 inches long. Flowers nearly 2 inches in diameter, grow singly on peduncles scarcely longer than the leaves.

84. ONCIDIUM SARCODES Lindl. in Journ. Hort. Soc., XIV. 260. L. F. p. 26.

O. Rigbyanum Paxt. Mag., Oct. 1849.

The habit is that of *O. pubes* and *amicum*. Flowers large, bright yellow blotched with brown-red. Column white with blood-red, fleshy, truncated wings.

Wild in Brazil, according to Garden authority.

Cf. Walp. Ann. III. 556. — *Oncidium Rigbyanum* Hort. Paxt. l. c.:

Pseudobulbs something cylindrical, 3 inches long. Leaves 2—3 on the summit of each pseudobulb, erect, lanceolate. Flowers paniculate. Scape one foot long. Sepals and petals bright lemon yellow, var. in the centre of each, with numerous dark brown spots. Labellum large spreading, twolobed, somewhat curved at the edges, bright yellow, spotted with dark green.

85. ONCIDIUM EXCAVATUM Lindl. in Sert. Orch. sub t. 25. B. R. 1839. Misc. 150. Paxt. Fl. Gard. I. t. 21. L. F. p. 27:

(B.) *aurosum*. Flowers deep brown in the middle. Crest very rugose, with a thin vertical plate interposed between the front lateral ridges.

O. aurosum Rehb. fil. in Bonpl. Mai 1. 1854.

Flowers bright yellow with brown stains near the base of the lobes. The crest is very convex, excavated in front, studded with small white tubercles, has a decurrent lamella from either side of the base, a small toothed ridge, and a pair of outlying teeth on each side. *O. aurosum* Rehb. can hardly be distinguished from *O. excavatum*. The crest is certainly rather different, and the flowers perhaps larger and more compactly arranged.

Wild in Peru; Chachapoyas—Mathews in hb. Hooker; sources of the Marañon—Warszewicz.

O. excavatum Lindl. Sert. 25:

Pseudobulbis foliisque ligulatis, scapo paniculato, bracteis squamiformibus membranaceis acutis, sepalis lateralibus obovatis obtusis liberis supremo concavo acuto, petalis membranaceis oblongis retusis basi angustatis, labello sessili pandurato apice rotundato emarginato sellaeformi basi cordato convexo fornicatum excavato, columnae alis retusis rotundatis.

Peruv. prov. Chachapoyas Mathews.

Lindl. Sert. sub 48: Pale yellow flowers spotted with brown, and is easily known by the base of the labellum being very convex, a little hollowed out in front, and excavated with a deep pit on the under side.

Lindl. Bot. Reg. XXV. 1839. Misc. 150: Peruvian plant; flowered with Loddiges. Yellow flowers, spotted with brown, and is easily known by the base of the labellum being very convex, a little hollowed out in front, and excavated with a deep pit on the under side. The petals and lower sepals are much more acute, than in my wild specimens from Chachapoyas, and it is probable, that the specif. charact. will require modifications.

85 b. *ONCIDIUM AUROSUM* Rehb. fl. v. Warscew. Bonpl. II. 108:

Aff. *O. sarcodi labelli pandurati angulis medianis lateralibus introrsis acutis, callo quadrato-rhombeo.*

Panicula robusta, pedalis et ultra. Rami ascendentes, flexuosi, polyanthi, bractea triangulari acutae, ovaria pedicellata florida decima-quinta parte aequantes. Sepala obovata cuneata, apice plus minus rotundata seu (summum praesertim) retusa, nunc imposito apiculo; tepala a basi late cuneata flabellata apice retusiusculo obtusangula nunc apiculata, paulo longiora, apice duplo latiora, labellum a basi cordata medium versus latere subcrenulato angustatum, subito expansum sub angulis insilientibus in laminam transversam basi labelli plus duplo latiore, antice nunc lobulatam, medio sinuatam; tabula carnosae utroque latere rhombeae vertice pleiotuberculata laevi in basi; gynostemium humile, alae subquadratae seu dolabriformes retusae integrae apiculatae, tabula infrastigmaticea utrinque lineae arcuata limbata. Eine schöne goldblüthige Art; die Hüllblätter sind auf der untern Hälfte rothbraun gefleckt. Es liegen uns grössere und kleinere Blüten vor: die grössten mögen denen des *Oncidium sarcodes* Lindl. (*Rigbyanum* Paxt.) gleichkommen. Diesem steht unser *O. aurosium* wohl am nächsten, allein dasselbe ist durch rundliche Trugknollen, Lippengestalt (dort sind die einspringenden Buchten der Lippe gerundet und kurz), feinbehaarten zweilappigen Buckel u. s. w. gut verschieden. Peru. v. Warscewicz.

86. *ONCIDIUM POLYADENIUM* L. F. p. 27:

O. panicula contracta pyramidali, petalis sepalisque retusis, labello basi circulari undulato denticulato lobo medio subrotundo bilobo latiore, crista convexa serialim verruculosa antice excavata lamellis 4 anticis denticulatis decurrentibus, verrucis pluribus segregatis, columnae alis obliquis obtusis subemarginatis.

Living plants were sold for Mr. Veitch at one of Mr. Stevens's sales in 1847, and the species is probably in cultivation. In a dried state it resembles *O. excavatum*, but the flowers are larger, apparently whole-coloured, in a close pyramidal panicle. The large circular base of the lip, numerous outlying lateral teeth, and five rows of little tubercles on the convexity of the crest abundantly distinguish it.

Wild in Peru—W. Lobb.

87. *ONCIDIUM CARDIOCHILUM* L. F. l. c. p. 27:

O. panicula ramosissima intricata divaricata, sepalis petalisque acuminatis, labelli pandurati lobis lateralibus cordatis convexis rotundatis, intermedio parum latiore reniformi-cordato acuto, crista carinata utrinque tridactyla, col. alis obsolete buccis convexis elongatis.

A fine species, with a singularly entangled branching divaricating panicle. Flowers as large as in *O. rupestre* or *Odontoglossum hastilabium*. The Guatemala form has a much thinner panicle, but does not seem to be different otherwise.

Wild in New-Grenada—Purdie; Guatemala—Skinner.

88. *ONCIDIUM IRICOLOR* Rehb. fl. in Bonpl. I. 1854. Lindl. Fol. l. c. p. 27:

Seen in cultivation in the garden of Mr. Frege. Said to differ from all others in having a four-toothed velvety crest and a whitish-lilac colour. The crest is further

described as being oblong, notched on each side, and two-toothed at the end, hence appearing four-toothed. In one place, Mr. Reichenbach calls the column-wings triangular and obtuse; in another rectangular, entire, and divaricating. The only flower I have seen, and an accompanying sketch, has extremely narrow sepals and a peculiarly thin texture. Is it not an accidental form of *O. incurvum*, with free sepals?

Wild in — —

Rehb. fl. Bonpl. II. p. 91:

(*Pentasepala macrotepala*): ab omnibus recedit callo basilari velutino quadrifidato, alis triangulis obtusis; colore albolilacino.

Panicula laxa. Sepala linearilanceolata acuta, lateralia sibi approximata; tepala duplo latiora, basi unguiculata, acuta, undulata, labellum basi rhombea antrorsum angustatum, apice dilatatum, subquadratum, lateribus externis grosse crenulatum, antice medio sinuato cum apiculo interjecto minuto, callus sericeovelutinus oblongus in basi, utrinque excisus, apice bidentatus (hinc quadrilobus); gynostemium prope rectum, androclinium descendens, processus rostellaris parvus dentiformis, tabula infrastigmatica utrinque medio obtusangula, disco excavata, alae rectangulae obtusae, integerrimae, divaricatae. Von Herrn Kammerrath Frege.

99. *ONCIDIUM PICTUM* HBK., I. t. 81. LO. p. 201. L. F. p. 28:

A species with a fine large pyramidal panicle of yellow flowers. It certainly belongs here, and not to the plurituberculate set.

Wild in the temperate parts of Popayan, at the height of 3240 ft. — HBK.; Peru—Mathews, 1920.

Sert. sub 48: Differs from *Oncidium altissimum* in its more compact panicle, large flowers, obsolete antherwings, apparently in the much less spotted flowers.

90. *ONCIDIUM AMPLIATUM* LO. p. 202. B. R. t. 1699. L. F. I. c. p. 28:

There are two varieties in cultivation, differing only in the size of the flowers. Panicle ample. Flowers yellow, much paler at the back than in the front. The crest at the back of the anther-bed is remarkable.

Wild in Central-America; Cuming, 1312; Costa Rica, on the shore in the gulf of Nicaya, also Nicaragua and Escuintla, in a climate the maximum of which is 85° — Skinner; Sa. Martha—Purdie; Columbia—Sinclair; Chagres—Fendler.

Pl. Hartw. II. p. 193: Escuintla Mexici Hartweg.

Lindl. Bot. Reg. 1835. XX. 1699:

Sepalis omnibus liberis, labello bilobo subrotundo transverso; laciniis brevissimis, callo baseos 5-lobo, lobis lateralibus patentissimis planis truncatis, intermediis teretibus centrali compresso, alis columnae cuneatis, dentatis, reflexis, pseudobulbis subrotundis compressis, foliis planis oblongo-lanceolatis, scapo erecto apice ramoso.

Folia et pseudobulbus facie omnino *O. papilionis*. Scapus adscendens, radicalis, 1½ — 2 pedalis, apice ramosus. Flores lutei, labelli dorso albo.

Sert. sub 48: Pseudobulbis subrotundis ancipitibus rugosis maculatis diphyllis, foliis oblongis coriaceis planis subundulatis scapo paniculato brevioribus. Panama et Guatemala. A noble species of which there are 2 var. one much larger, than the other. According to Mr. Skinner it is from Costa R.

Lindl. in Hook B. Journ. 1831. I. p. 7: Panama et Columbia occid. Cuming 1312.

Bot. Reg. XXVI. Misc. 97: Costa Rica; found on the sea shore in the Gulf of Nicaya; since found throughout the coasts of Nicaragua and also in the Escuintla 15 leagues from Guatemala climat. 80°. — 85°.

Bonpl. II. 13. Rehb. fl. : „Barquisinito.“ Caracas. Wager.

91. *ONCIDIUM JAMIESONI* Lindl. in Paxt. Fl. Gard., I. under t. 21. L. F. p. 28:

Flowers yellow, with a brown base to the petals, a few imperfect ones mixed with the others—the only case of the kind in the present group.

Wild in Peru; Quito—Jamieson.

Lindl. l. c.:

Pseudobulbo —, folio carinato complicato, panícula effusa ramulis divaricatis, floribus heteromorphis pluribus abortientibus, sepalis linearibus obtusis rectis, petalis duplo latioribus oblongis obtusis subundulatis, labello auriculato apice semicirculari bilobo, cristae tuberculis 5 parvis, duabus lateralibus patentissimis caeteris subparallelis intermedio productiore, columnae alis oblongis erectis rotundatis.

Quito Peruviae.

Yellow flowers having broken bands at the base of petals and nowhere else. Wings of column are not unlike a bat's ears. Jamieson.

92. *ONCIDIUM FORMOSISSIMUM* Rehb. fl. in Bot. Ztg. 1852. p. 694! L. F. p. 28:

Sepals and petals dark purple, upper half yellow; lip wholly yellow. Petals four times as large as sepals, quite sessile. Lip very large; its lateral lobes oblong, two-lobed, small; the middle one very broad, unguiculate, reniform, or rather crescent-shaped. Crest small with five collateral equal downy round tubercles, in front of which is a thin three-lobed arched membrane. Column-wings very large, hatchet-shaped, with the angles rounded. This is one of the finest of the genus. It differs from *O. Jamiesoni* in its uniform flowers, which are much larger, with far larger column-wings.

Wild in Peru; Loxa—Warszewicz; Andes of Quito—Jamieson.

Rehb. fl. l. c.:

Perigonii phyllis externis oblongis obtusiusculis, basi subcuneatis, abbreviatis, phyllis lateralibus internis oblongis acutiusculis ima basi subcuneatis, quadruplo majoribus, labelli maximi lobis lateralibus oblongis obtusis bilobis divaricatis parvis, lobo medio latissimo unguiculato reniformi, medio acuto, callo baseos cristaeformi, parvo, plurituberculato, gynostemii recurvati alis maximis, oblongis, microscopice crenulatis, androclinium apice libero triangulo longe excedentibus, alulis minutissimis coriaceis suppositis.

Hüllblätter schwarzpurpurn, die vordere Hälfte goldgelb, Lippe ganz gelb. Loxa.

Rehb. l. c.: Diese Art hat zwar mit *O. cultratum* Lindl. Aehnlichkeit wegen fast eben so vertheilter Farbe, allein sie ist sehr verschieden. Die Blätter sind häutig: die Hüllblätter höchst ungleich, ohne gefärbte Nerven, die Lippe beiderseits am Grund öhrig-gelappt, in der Mitte eng verschmälert, plötzlich sehr erweitert.

(93. *ONCIDIUM LEOPARDINUM* Lindl. l. c. p. 28 = *O. tigratum* Rehb. fl. N. 129.)

94. *ONCIDIUM HEROGLYPHICUM* Rehb. in Allg. Gartenztg., Sept. 2. 1854. L. F. p. 28

Wild in Peru—Warszewicz.

Related, but not very nearly, to *O. excavatum*. Lip flat, deeply two-lobed. Space below the stigma three-chambered at the upper end. Crest velvety. Column-wings small and two-lobed, the upper lobe small and passing into the larger. Rehb., who examined a living specimen in the garden of Senator Jenisch of Hamburg. — „Pseudobulbis caespitosis ovalibus laevibus disciformibus monophyllis; foliis papyraceis oblongis acutis undulatis brevibus; racemo simplici; bracteis lanceolatis acuminatis; perigonii foliolis subreflexis undulatis sordide fusco-maculatis apicem versus flavidis, sepalis brevi unguiculatis, petalis sessilibus subduplo latioribus; labello trilobo, lobo medio latissimo flavido profunde bilobo undulato, lateralibus oblongo-obovatis horizontalibus erectis sellaeformibus, crista septemgibba minutissime puberula; c. alis brevibus sub-emarginatis.“ — Klotzsch in Allg. Gartenztg. 16. Sept. 1854, mutatis mutandis. The three cavities on the column beneath the stigma are remarkable. I have seen a solitary flower and a sketch from Mr. Rehb.

Rehb. fl. in Otto und Diettrich Allgem. Gartenztg. N. 35. 1854. p. 274:

Affine (cui tamen haud proprius accedit) *Oncidio excavato* Lindl.!

labello plano profunde bilobo, tabula infrastigmatica apice (sub fovea) tricamerata, callo velutino, auriculis parvis bilobulis, lobulo superiori minuto in lobulum majorem transeunte.

Sepala ac tepala latiora margine minute undulata lanceolata, flava, apicibus exceptis dense et confluentem maculata. Labellum basi utrinque humerato ac rotundo lobatum dein ac ungue angusto in lobum medium basi sublatiorem reniformem dilatatum, apice profunde bilobum, lobo altero alteri oblique imposito, flavum, unguis basi brunnea; callus velutinus inter lobos basiliares depressus utrinque bilobus, lobis serrulatis, apice rostratus, auricula extrorsa utrinque sub rostro. Gynostemium curvatum, fovea limbata; auriculae sub vertice obtuse bilobae, lobo inferiori majori; tabula infrastigmatica antrorsum obtusangula sub stigmate trifoveolata carinulis 2 interjectis. Rostellum obtusum. — Pseudobulbi plani, argute acicipites.

Rehb. fl. Bonpl. III. 215: Pseudobulbus anceps, humeratus, ovatus. Folia ligulata obtuse acuta 4,5' longa, medio 2" lata. (Nach dem lebenden Original in Hrn. Senator Jenisch's Garten.)

95. ONCIDIUM OBRYZATUM Rehb. fl. in Bonpl., Mai 1, 1854. L. F. I. c. p. 29:

This seems to have the habit of *O. excavatum*, but the flowers are rather smaller. Its very narrow obtuse spatulate unguiculate sepals are remarkable. The crest of the lip consists of a downy middle keel, two broad thin teeth on either side its point, and a small wart at the base of each of these.

Wild in Peru—Warszewicz.

Rehb. fl. I. c.:

Aff. *O. Jamiesoni* labelli callo basilari carinato velutino, utrinque papuloso antepositis carinulis ternis falcatis, alis angustis apice longe acuto falcatis.

Panicula compacta, rami ramulosi flexuosi, bracteae lanceae acuminatae ovaris pedicellatis multo breviores, flores illis *Oncidii Wentworthiani* aequales, sepala a basi lineari spatulata, obtusiuscula, tepala subaequalia, duplo—triplo latiora, labellum basi reniforme, dein in unguem linearem subito contractum pro parte anteriori hastato reniformi, crenata, apice exciso sinuata; duplo latiori, quam parte basilari; carina basilaris velutina, utrinque papulosa, antepositae carinulae ternae falcatae; regio circa callum in sicca planta velutina; gynostemium breve; regio stigmatica duas tertias occupans; stigma angustum; dens rostellaris parvus, dellexus, alae angustae dolabriformes, longae, basi obtusatae, extus denticulatae, apice longe acuto falcatae; tabula infrastigmatica brevissima, pandurata. Wahrscheinlich steht unsere Pflanze nächst *O. Jamiesoni* Lindl.; dieses hat nur 5 Lippenschwielen und runde Säulenöhrchen. Blüten gelb, unterer Theil der Tepala und der Lippe braun gefleckt. Peru. v. Warszewicz.

96. ONCIDIUM CRISTA GALLI Rehb. fl. in Bot. Zeit. 1852. p. 697. L. F. p. 29:

Lip very large in proportion to the small, acute, flat sepals and petals, its whole margin crisp, the middle lobe very broad, stalked, four-lobed, the lateral lobes rounded, those in front ligulate and parallel! — Rehb. I have only seen a sketch of this, which appears to be a very distinct species.

Wild in Peru—Warszewicz; Jürgensen 646, vide Rehb. in litt.

Rehb. fl. in Bpl.:

Perigonii phyllis externis lanceolatis acutis, lateralibus internis oblongis acutis crispulis triplo latioribus, labello maximo sexlobo, ima basi humerato, toto margine subtiliter crispulo, lobis posticis oblongo-cuneatis, lobo medio latissimo unguiculato, quadrilobo, lobis lateralibus rotundatis, anticis ligulatis, parallelis, crista longitudinali carinata lobulata in media basi ad unguem lobi medii transgrediente, cristulis minutis, carinatis adjectis, columnae alis dolabriformibus subintegerrimis, rostello ac anthera ornithorrhynchis.

O. iridifolium „folia nunc explanata“ Lindl. B. R. 1911 ?

O. an iridifolium Galeotti Herb. 5289. Blüher lineallanzettlich, spitz, sechs, zweizeilig unter dem flachen, niederen, ganz kleinen Trugknollen, welcher ein entwickeltes und ein verkümmertes Athmungsorgan trägt. Alle sind etwa 2'' lang. Die Blütenstiele schlank, Stiel rund, 2'' hoch, vierlühlig. Deckblätter dreieckig, spitz, am Grunde geöhrt. Blüten so gross, wie die eines grossblühigen *O. iridifolium*. Oaxaca. Galeotti.

Huc *Oncidium decipiens* Lindl. Fol. p. 22. N. 68:

Oncidium iridifolium Lindl. in Bot. Reg. t. 1911.

Very much like *O. iridifolium* (no. 26.) from which it differs in having flat leaves, a crest of five flat rounded plates instead of a deep middle tooth with concave appendages on each side, and an additional toothlet on the outer edge, in the petals being very small, not as long as the side lobes of the lip, and in the wings of the column being merely eroded, not coarsely toothed.

Wild in Mexiko; near Oaxaca at 3000 ft.—Galeotti, 5289; Guatemala—Skinner in hb. Hooker.

97. *ONCIDIUM CHRYSOPYRAMIS* Rehb. fil. in Bonpl. May I. 1854. L. F. p. 29:

Near *O. pyramidale* (Rehb.) — from which it differs in having much smaller flowers, a thinner and weaker panicle, and very narrow deeply two-lobed column wings, whose halves curve away from each other.

Wild in New-Grenada and the Western Cordillera—Warszewicz.

Huc Rehb. Warszew. l. c. II. 108:

Aff. *O. pyramidale* labello basi latiori quam antice, carinulis linearibus in basi bis ternis, media posteriori apice trifida, alis divergenti bifidis.

Pseudobulbi oblongi angusti ancipites monophylli, folia a basi cuneata lineariligulata (pollicem lata) acutiuscula (-5pollices longa); panicula elongata (-bipedalis), brachyclada (-4pollices), ramorum flexuosorum ramuli abbreviati, fractiflexi, basifares 3—5flori; bractee triangulae acutae ovaris pedicellatis ultra quinquies breviores; flores aurei illis *Oncidii ornithorrhynchi* paulo minores, sepalum dorsale ovatum cuneatum, sepalum lateralia oblonga cuneata aliquid longiora, tepala ovata supra basin subito et brevissime cuneata, labelium a basi brevissime ac late unguiculata margine basilari postico et antice reniforme, antice medio angustatum in unguem latum lobi mediani divergenti bilobulati obtusanguli parti suprabasilari haud aequali, carinula linearis antice tridentata parva in basi, adjecta utrinque lineola divergens, praepositae lineolae ternae carinatae, gynostemium recurvatum, androclinium valde subulatum ornithorrhynchum, alae lineares, apice utrinque falcatae, falcula superiori vulgo bidentata, tabula infrastigmatica rotundata valde protrusa. Neben *Oncidium pyramidale* Lindl.! Dieses ist (abgesehen von gefleckter, grösserer Blüthe) verschieden durch grössere, unten breitere Pseudobulbi, breitere Blätter, eine Lippe, deren Grund schmaler, als Vorderstück, deren Mittelstück viel breiter ist; deren Leistensystem einen ganz andern Plan zeigt; eine weniger keck zurückgebogene Säule mit einfachen linealen Flügeln; eine über dem Grunde viel stärker abgesetzte Tabula infrastigmatica. Neu-Granada: West-Cordilleren. v. Warszewicz. — So unbedeutend die einzelnen Blüten sind, so muss die gut cultivirte Pflanze einen prachtvollen Eindruck machen.

98. *ONCIDIUM PYRAMIDALE* Lindl. in Ann. Nat. Hist., XV. 384. L. F. p. 29:

Scape six inches long. Panicle nearly a foot more, not more than four inches wide, with stiff lateral zigzag branches, each bearing six or seven flowers on average. Its broad terminal wedge-shaped two-lobed column-wings are very remarkable.

Wild in Peru; near Pasto, in the woods of Meneses, on trees—Hartweg.

Lindl. l. c.:

Pseudobulbis ovatis ancipitibus 2—3 phyllis, foliis oblongis tenuibus basi angustatis scapo erecto rigido paniculato pyramidali multo brevioribus, sepalis obtusis liberis dorsali ovali, lateralibus linearibus, pe-

talibus duplo latioribus ovatis obtusis, labelli lobis lateralibus amplexicaulibus, intermedio bilobo latioribus, crista antice excavata processibus 7 (?) linearibus anticis longioribus, columna nana alis verticalibus lineari cuneatis sublobatis, rostello subulato.

Pasto (Hartw.) woods of Menesco.

Near *O. excavatum*, but with the rostellum of *O. ornithorrhynchum*. Scape a foot and a half high.

99. *ONCIDIUM LANCIFOLIUM* Lindl. in Plant. Hartw. p. 151. L. F. p. 29:

This is very much like *O. pyramidale*, from which it is distinguished by its column-wings being lateral, not terminal, and by its crest consisting of five nearly equal spreading fingers. The definition of the crest in the „Pl. Hartweg.“ is, owing to some inexplicable accident, wholly erroneous.

Wild in Peru; Cordillera near Loxa-Hartweg.

Lindl. l. c. (1844):

Pseudobulbis oblongis compressis, foliis lanceolatis acutis, scapo stricto apice paniculato brevioribus, ramis valde flexuosis, sepalis linearibus obtusis, petalis obovatis subundulatis duplo latioribus, labelli basi obcuneati lobo intermedio transverso bilobo, cristae tuberculis plurimis carnosis ramentaceis, columnae recurvantis basi biauris, alis maximis acinaciformibus subserratis undulatis.

Folia semipedalia. Scapus cum floribus pedalis; panicula compacta, rigida, flores verosimiliter lutei, purpureo fusco versus medium variegati.

In Cordillera prope Loxa.

Pact. Fl. G. I. 104: „Leaves 6 inches. Scape about 6 inches. Panicle oblong, close, not quite so long. Flowers small, apparently yellow speckled with purple.“

Lindl. Fol. p. 30:

O. fasciferum Rehb., will be found among the *Plurituberculata*.

O. sessile Lindl., has the petals so little different in size from the sepals, that it is better stationed in the *Paucituberculata*.

O. stenopetalum, Klotzsch in Allg. Gartenztg. Sept. 1, 1855, is not to be identified or accepted as new, in the absence of a more sufficient specific character.

Obs. Oncidium stenopetalum Klotzsch me iudice est *ramosum* Lindl. Rehb. fil.

§. 8. *Integrilabia* Lindl. l. c. p. 30.

100. ONCIDIUM MEIRAX Rehb. fil. in Bonpl. II. 12. 1851. Xenia: p. 42. t. 18. f. 3. L. F. p. 30:

A singular little plant only a few inches high. Leaves solitary on the oblong pseudobulbs, slightly emarginate. Scape two-flowered, shorter than the leaves. Lip cordate, acuminate. Sepals and petals linear, a little narrowed to the base. Prof. Reichenbach places it among the Cimiciferous microchites, p. 9.

Wild in the Caracas—Wägener.

Rehb. fil. in Bonpl. II. 12:

Pseudobulbis ovatis, folio apicilari ligulato apice subbilobulo, pedunculo ultra bipollicari ex 3—4 internodiis constructo, fractiflexo Hofmeisterellae pedunculo subsimili, alato bifloro, bracteis scariosis triangulari ovaria pedicellata longe non aequantibus, sepalis lineariligulatis acutis basi valde attenuatis, tepalis subaequalibus, basi haud multum angustatis, labello cum gynostemio prope rectangulo, triangulo, angulis lateralibus rotundatis, tuberculo baseos trifalculato, anteposito altero bifalculato, gynostemio gracili, apice aptero, tabula infrastigmatica utrinque alata, anthera?, pollinibus?, capsulis oviformibus tripteris rostratis, alis in ovaria descendentibus.

Blüthe so gross, wie die des *O. deltoideum*; grünelb mit Purpurflecken. Herr Wägener traf nur eine Pflanze. 5000', März 1851. Caracas.

101. ONCIDIUM ORNITHOCEPHALUM L. F. 30:

O. panicula gracili tenui ab ipsa basi rectangule ramosa heterantha, sepalis petalisque linearibus acuminatis reflexis, labello circulari apiculato, crista multiloba $\frac{5}{4}$ verrucis quibusdam segregatis utrinque, columna hirsuta alis maximis acutis fornicatis, stigmathe rostrato.

I received a living specimen of this delicate and graceful thing from Mr. Linden, in April 1852. It bears very few small yellow flowers, spotted with bright brown, amidst numerous stellate abortions.

Wild in New-Grenada; near Sa. Maria, in the province of Ocanna—Schlim, 296.

102. ONCIDIUM MAGDALENAE Rehb. in Bonpl., March., 1855. L. F. 31:

O. panicula gracili rectangule ramulosa homoeantha, sepalis petalisque unguiculatis spatulatis acutis, labello cordato obtuse acuminato, crista multiloba $\frac{4}{3}$ verrucis 0 segregatis, columnae alis maximis obtuse dolabriformibus, stigmathe rostrato.

Very like *O. ornithocephalum*, but not heteranthous. The flowers are larger, yellow, with a deep brown stain at the base of all the parts. The lateral sepals have filiform ungues longer than the oval limb; the dorsal sepal is nearly sessile; the

dorsal sepal is nearly sessile; the petals finely unguiculate, but much shorter, than the lateral sepals.

Wild on the R. Magdalena; Pericos at the height of 7000 ft. — Wagoner.

Rehb. fl. Bonpl. III, 66: Panicula fractiflexa amplissima, sepalo summo ac tepalis ovatis acutis ungue aequilongo unguiculatis, sepalis lateralibus longius unguiculatis, labello cordato acuto abbreviato, tumore basilari trisulcato, falculis quibusdam antepositis, insulis velutinis utrinque, gynostemio paulo refracto, rostello deflexo acuminato, tabula infrastigmatica utrinque biloba, alis bilobis supra obtusis maximis. — Adest folium in specimine hebetato tripollicare oblongum acutum pergamenium. Panicula brachyclada. Flores sicci flavi, sepala ac tepala supra unguem atropurpureo maculata; labelli discus atropurpureus, linea superposita utrinque ejusdem coloris. Pericos, 7000'. Río Magdalena. Wagoner.

103. *ONCIDIUM DELTOIDEUM* Lindl. in B. R. t. 2006. Paxt. Fl. G., II. ic. 257. L. F. 31:

Flowers in a large, stiff, compact panicle. Sepals and petals whole-coloured. Crest of the lip reaching more than half way from the base to the point, consisting of numerous straggling warts and teeth.

Wild in Peru; Chachapoyas—Mathews.

Lindl. Bot. Reg. 1837. XXIII. sub 1920 et 2006:

Pseudobulbis oblongis compressis sulcatis monophyllis, foliis lineari-lanceolatis canaliculatis, scapo paniculato ramis multifloris, flexuosis divaricato, sepalo supremo unguiculato obovato lateralibus longioribus spathulato-lanceolatis apice revolutis, petalis latioribus obovatis crispis, labello deltoideo angulis rotundatis, crista tuberculata serie subduplici tuberculorum juxta basin et quatuor versus apicem majoribus distinctis biserialis minore interjecto, columnae alis maximis acinaciformibus.

Omnes partes virides leviter glabrescentes. Panicula secunda, nutans in apice scapi sesquipedalis. Sepala et petala lutea. Labellum apice acutiusculum reflexum. Crista e tuberculis brevibus oblongis composita, fere totum discum labelli occupans; tubercula basales interiora in circulum confluentia unico centrali magis prominulo; exteriora in lineas duas interruptas divergentes ordinata; ultra haec versus apicem adsunt unum oblongum in apice circuli et utrinque duo alia majora patentia et magis versus apicem tendentia; circulus et tubercula exteriora pallide flavescunt maculis quibusdam sanguineis interjectis. Alae columnae in planta culta integerrimae, in spontanea denticulis quibusdam marginantes.

Sert 48: Panicle erect, much branched and compact at the top of the scape. Flowers whole coloured, yellow, with only a few red spots on the lip, all the green parts are slightly glaucous.

101. *ONCIDIUM HARTWEGII* Lindl. Pl. Hartw. p. 151. Paxt. Fl. G. II. ic. 133. L. F. p. 31:

O. micranthum Skinner in Hort.

Flowers dirty brown, in a loose spreading panicle. Tips of the sepals, petals, and lip, alone dirty yellow. Differs from *O. deltoideum* not only in colour, but in the crest, half-buried in hair, consisting of nine closely packed papillae.

Wild in Peru; on rocks near Loxa—Hartweg.

Lindl. Hartw. l. c.:

Pseudobulbis ovatis compressis diphyllis, foliis lanceolatis carinatis patulis scapo longissimo paniculato multo brevioribus, panicula angusta ramulosa multiflora, sepalis petalisque lineari lanceolatis acutis undulatis, labello subcordato concavo, cristae tuberculis centralibus minoribus lateralibus ramentaceis truncatis, columnae alis maximis subrotundo-cuneatis serrulatis.

Folia 6—8" longa. Scapus 2—3pedalis. Flores parvi.

In rupibus prope Loxa.

Gardeners Chron. 1853. 15. Oct. 663. c. A straggly plant, with habit of *O. altissimum*. The pseudobulbs are deeply and ruggedly grooved, leaves are about 1½ inch long, broadly lanceolate, very much shorter, than the long narrow, racemose panicle. Flowers small, brownish, with some yellow spots, especially at the angles of the lip. Crest of lip bristle with fine stiff white hairs, by which circumstance among others it is known from *O. deltoideum*.

105. *ONCIDIUM NIGRATUM* Lindl. in Paxt. Fl. Gard., I., Nr. 122. L. F. p. 31:

Flowers cream-coloured in branched panicles, with dark blackish brown spots and bands. The sepals and petals are linear-lanceolate, equal, and wavy.

Wild in Guayana—Schomburgk, fide Loddiges.

Paxt. Fl. G. I. p. 72. nr. 122. Guiana. Cream col. flowers spotted with blackish brown, arranged in a panicle. Introduced by Lodd.

Panicula ramosa, sepalis linearilanceolatis undulatis acutis aequalibus, labello triangulari postice rotundato, apice angustato acuto, crista multituberculata, columnae alis angustis subdentatis basi productis.

Sir W. Schomburgk disc. Allied to *O. phymatophilum*. Blossoms as large as those of *O. incurvum*. Colour of sepals and petals is pale yellow or cream colour with a few irregular brownish black blotches. Lip is bright yellow, with a brown stain or two below the point.

106. *ONCIDIUM PUMILUM* Lindl. Orch. 205. B. R. t. 920. Bot. Cab. 1732. Bot. Mag. t. 3551. Paxt. Fl. G., II. ic. 132. L. F. p. 31:

Epidendr. ligulatum Arrab. Fl. Num. ix. 15.

Flowers small, yellow in a dense erect branching panicle. The crest consists of a pair of parallel converging ridges, reaching as far as the re-entering angles of the lip. The pollen masses are very narrow, furrowed at the back, and stand upon a sagittate caudicle. Prof. Reichenbach remarks to me, that if it were prudent to dismember *Oncidium*, this plant would deserve to be removed.

Wild in Brazil; on branches of *Crescentia*, Rio Comprido—Gardner, 124, Grisebach, Miers; Cabeja de Fraadre, Serra d'Estrella—Luschnath.

—Lindl. Hook. Lond. Journ. III. 508. 1844: Kingston, Wm. Purdie, common on Logwood hedges.

107. *ONCIDIUM NANUM* Lindl. in Bot. Reg. 1842, misc. 30. Paxt. Fl. G., II., ic. 130. L. F. p. 32:

Resembles *O. pumilum*, but is totally different in the form of the parts of the flower. The wings of the column have a secreting gland at the point, as in some other species.

Lind. l. c. misc. 30:

Pseudobulbis nullis, foliis rigidis ovalibus concavis, racemo stricto foliorum longitudine, sepalis petalisque obovatis obtusis incurvis, labello lucido auriculato apice cuneatim dilatato emarginato, callis disci duobus basilari transverso altero longitudinali trisulcato, alis columnae angustissimis decurvis apice glandulosis.

Habit of *O. pumilum*, to which it is nearly allied. It differs having very much larger flowers, and in the form of its lip, which is varnished as it were, and bears two large warts, one transverse and one longitudinal, placed at right angles to each other. The form of the wings of the column is almost that of a straight knife-blade directed down-wards, and tipped with a lucid gland. Lodd. obtained from Guayana (1827.)

108. *ONCIDIUM GRACILE* Lindl. in B. R. sub t. 1920. Paxt. Fl. G., II. ic. 123. L. F. p. 32:

Scape slender, eighteen inches long, with a very few flowers at the end. Lip yellow. Sepals and petals chocolate-brown. This flowered in 1810 with the late Mr. Barker.

Lindl. B. R. l. c. sub 1920:

Pseudobulbis ovatis compressis diphyllis, foliis lanceolatis acutis brevibus, scapo gracili apice racemoso 3—6floro, sepalis lineari-lanceolatis, petalis paulo latioribus, labello cuneato emarginato basi auriculato lamellis duabus linearibus cristato, columnae alis oblongis integris.

Brazil. Von Martius.

The scape of this species is about a foot high, with from 3 — 6 rather small flowers at the end. The leaves are not more than 2 inches long, and the pseudo-bulbs about $\frac{1}{2}$ that length. The lip is yellow, the remainder of the flower reddish brown and green.

Sert. 48: Dry ferruginous rocks of Villa Rica.

109. ONCIDIUM BARBACENIAE Lindl. F. p. 32:

O. scapo paucifloro foliis gramineis longiore, sepalis lateralibus parvis unguiculatis concavis, labello obovato reduplicato emarginato, cristae papillis liberis anterioribus brevioribus dorsali rostrato elongato.

I have only seen a sketch of this, which seems to be quite different from all the other known Brazilian species. Its lip is large and yellow. The sepals and petals are very small, and brownish green, spotted.

Wild in Brazil; Barbacenia, in the province of Minas Geraës—Weddell.

110. ONCIDIUM GRAMINIFOLIUM Lindl. Sert. Orch. sub t. 48. L. F. p. 32:

(A) *holochilum*. Lip ovate, undivided. Raceme as long as the scape or nearly so. Sepals and petals brownish, clouded.

Cyrtochilum graminifolium Lindl. in Ann. Nat. Hist., IV. 384, 1840.

(B) *filipes*. Lip emarginate, somewhat lobed. Raceme confined to the end of the scape. Sepals and petals brownish clouded.

O. filipes Lindl. Sert. Orch. sub t. 48.

Cyrtochilum filipes Id. in B. R. 1841, t. 59.

(C) *Wrayae*. Lip emarginate, somewhat four-lobed. Flowers paniced. Sepals and petals bright yellow, with deep brown spots.

O. Wrayae Hooker in B. M. t. 3851.

A further comparison of these plants has convinced me, that they are all forms of one species, which, like *O. maculatum*, assumes different forms, according as it is influenced by locality or other causes. The long slender graceful raceme or panicle, and the broad obovate or reniform yellow lip, distinguish it readily from that species.

Wild in Mexico; A, Hacienda del Carmen—Hartweg; Cerro del Capulalpan, Oaxaca, on the ground, at 8—9000 ft. of elevation—Galeotti, 5177; B, Guatemala — Skinner, Hartweg; C. Mexico—Hort.

A. Huc: *Oncidium graminifolium* Lindl. l. c.:

Foliis lineari-ensiformibus acutissimis erectis racemo supaniculato brevioribus, labello obovato integerrimo basi 5 lamellato, columnae alis parvis rotundatis.

Mexico. Hartweg.

Much like *C. maculatum*, but differs in the form of its lip, its very narrow leave and smaller flowers.

Bot. Reg. XXVII. Misc. 180. (1841): This plant, which resembles *C. maculatum* in habit, but has a yellow lip, the form of which is that of a wedge, with rounded angles, has flowered with Loddiges, who imported it from Oaxaca (1265). Nearly allied to *Cyrtochilum filipes*, but differs in the form of the lip.

B. Huc: *Cyrtochilum filipes* Lindl. B. Reg. XXVII. (1841.) Misc. 72:

Scapo longissimo simplici filiformi apice ipso paucifloro, sepalis petalisque lanceolatis conformibus acutis planis, labello cuneato bifido

apice dilatato basi dente porrecto subsimplici subtuberculato aucto, columnae alis minimis cuneatis truncatis.

A *Cyrtochilum* with the yellow flowers of an *Oncid*, imported from Guatemala by Mr. Bateman. It has a very slender stem, above 2' long, perfectly simple, on the extreme point of which are 4—5 flowers about the size of these of *C. maculatum*.

C. Huc: *Oncidium Wrayae* Hook. Bot. Mag. 3854:

Pseudobulbis ovatis compressis sulcatis, foliis 2 terminalibus lineari-lanceolatis, scapo radicali elongato ramoso, floribus paniculatis, petalis sepalisque conformibus ovato-acuminatis patentibus ferrugineo-maculatis, labello unicolori late cuneato-obovato trilobo cristato, crista elevata acute triloba.

Perigonium flavum, rubro-brunneo pictum, salvo labello croceo.

Mexico, collect. Oakfield near Chelham: Wray.

Bot. Reg. XXVII. 1841. Misc. 57. This would seem new, but is evidently very near *O. reflexum*, Wentworthianum and Tayleurii. The fig. in Bot. Mag. by which alone I know it, is evidently inaccurate in these minute, but important details, a correct knowledge of which is indispensable in this large and difficult genus, that it is not easy to place any confidence in it.

411. ONCIDIUM BRACHYANDRUM Lindl. Sert. Orch. sub t. 25. L. F. p. 33:

The leaves etc. are unknown. Of my two specimens, one is one-flowered, the other two-flowered. The lateral sepals are so close at the base, as to give the flowers the appearance of being tetrapetalous.

Wild in Mexico—Karwinski; St. Jago el Grande, Oaxaca—Grisebach, 26.

Huc: *Oncidium brachyandrum* Lindl. Sert. l. c. (1839):

Pseudobulbis foliis q. . . ., scapo tenui sub-bifloro, sepalis lineari-lanceolatis undulatis acuminatis, lateralibus basi contiguis, petalis latioribus conformibus, labello obovato membranaceo emarginato convexo, tuberculis binis parallelis extrorsum sinuatis, columna nana crassa longioribus, alis parvis truncato triangularibus.

Mexico, prope St. Jago el grande, Oaxaca, Karwinski.

412. ONCIDIUM LUNATUM Lindl. in Bot. Reg. t. 1929. Paxt. Fl. G., II. ic. 122. L. F. 33:

The figure in the „Bot. Reg.“ represents the base of the lip as provided with a pair of inflexed teeth. This is a mistake of the artist. It is really a thin circular downy membrane, curved inwards over the central ridge. Prof. Reichenbach suggests to me that this may be nearer *Solenidium*, than the present genus. It does not, however, appear to me anything more than a somewhat anomalous form of *Oncidium*. The lacerated membrane at the back of the anther-bed has its parallel in *O. ampliatum*, and the uneven number of lobes of the crest, so characteristic of *Oncidium* is made up by the presence of a tooth at the base of the lip, overlooked in the „B. R.“ The most remarkable features consist in the presence of a broad wedge-shaped recurved peak to the anther, and in the absence of the buccae or cheeks, which belong to the column of true *Oncidia*. I add a few memoranda, made upon re-examining a dried flower. Sep. lat. basi ima connata. Labellum basi auriculis circularibus indivisis incurvis; crista ante columnam dente aucta. Columna semiteres, sursum angustior; buccis nullis; alis dimidiato-ovatis membranaceis acutis. Clivandrium dorso in membranam ovatam dentatam productum. Stigma circulare, prominens. Anthera unilocularis, apice membranacea elongata cuneata refracta. Pollinia etc. *Oncidii*.

Wild in Demerara—Loddiges.

Huc: *Oncidium lunatum* Lindl. l. c. XXIII. (1837.) sub 1920. et tab. 1929:

Pseudobulbis compressis 1—2 phyllis, foliis anguste oblongis planis obtusis scapo brevioribus, scapo racemoso; sepalis petalisque spatihu-

latis retusis, labello pubescente lunato basi piloso, laciniis lateralibus minimis inflexis, crista lineari apice depressa utrinque bidentata, dentibus glanduligeris, alis columnae cuneatis integris, clinandrio postice dentato.

A pretty little species with a white crescent-shaped lip, blotched with dull orange, and white sepals, blotched with dull orange.

Demerara. — B. R. l. c. 1929: Alae columnae sanguineo fasciatae.

113. *ONCIDIUM MACULATUM* Lindl. Sert. Orch. sub t. 48. L. F. p. 33:

(A) *herbaceum*. Sepals and petals pale green, blotched with purple. Lip with four simple carinae, cuspidate, broadest at the point, with the lateral lobes at or above the middle.

Cyrtochilum maculatum Lindl. in Bot. Reg. 1838, t. 44. Sertum Orch. t. 25.
Hooker in B. M. 3836.

(B) *Russellianum*. Sepals and petals pale green, with very large well-defined deep purple blotches. Crest with a pair of curved teeth at the base. Flowers much larger.

Cyrt. maculatum var. B. M. t. 3880.

Oncid. tigrinum Hort. Angl.

(C) *parviflorum*. Flowers smaller. Lateral lobes of lip larger. Lateral sepals more or less connate.

Cyrt. maculatum parviflorum B. R. 1844. Misc. 87.

(D) *Lindleyi*. Flowers in a large spreading panicle, coloured as in B. Lip hastate owing to the side lobes being near the base, and the middle lobe much elongated. Keels of the crest toothed and wavy.

Odontoglossum Lindleyi Galeotti in litt.!

Oncid. maculat. Donianum Rchb. fil. in Bonpl., Aug. 1, 1855!

(E) *vinosum*. Sepals and petals dull brown, very little blotched with greenish yellow. Lip yellowish, with the lower half claret-coloured; its lateral lobes short and near the base; the middle lobe ovate, acute, not cuspidate; keels of the crest toothed, lobed, and curved.

(F) *psittacinum* Rchb. fil. Flowers large. Sepals and petals with small distinct circular spots on a yellow ground. Keels of crest simple.

O. psittacinum Linden! fld. Rchb.

There seems to be no line of distinction between these six forms, different as is the appearance of some of them. They are all deliciously scented, and among the most valuable to cultivators. At one time I thought, that the form of the lip and the keels of the crest, which are much lobed or toothed in D and E, might be taken as specific marks; but I fear they are inconstant and accidental. E was cultivated in 1840, by the late Mr. Barker, but I have not seen it since. Of C. no specimens are now in my herbarium.

Wild in Mexico and Guatemala, very common.

Huc: *Cyrtochilum maculatum* Lindl. B. R. XXIV. (1838). Misc. 39:

Pseudobulbis ovatis compressis subangulatis diphyllis basi foliosis, foliis late ligulatis acuminatis striatis apice oblique emarginatis, scapo simplici (?), bracteis brevissimis squamaeformibus, sepalis petalisque carnosissimis obovato-lanceolatis acutissimis, labello membranaceo oblongo apiculato utrinque dentato, lamellis duabus ad basin et corniculo utrinque, alis columnae falcatis integerrimis.

Found near Vera Cruz by Hartweg, sent to the Horticultural Soc. It has rather large flowers, with a greenish yellow ground colour, blotched with deep rich purple and a whitish lip, with a few stains of dull red. I have also received it from Messrs Rollisson.

Huc: Floral Cabinet II. (1838.) Tab. 57.

Huc: *Cyrtorchilum maculatum* var. *Russelianum* Lindl. Bot. XXVI. (1840.) Misc. 86:

One of the many fine varieties of *Cyrtorchilum maculatum* with very large, richly spotted flowers. Mr. Skinner calls it *C. Russelii* and gives the following account of it: its habitat is cold climate; it luxuriates amongst pines, but only attached to oaks. No plants of the Orchid. tribe are ever found on pines, except *Cataseta* towards the north coast, but then those plants form such a mass of hairy roots as to secure them completely from the influence of the pitch that in all hot climate, constantly oozes from the pines.

Cyrtorchilum maculatum var. *parviflorum* Lindl. B. R. XXVII. (1841.) Misc. 87:

Labello subhastato laciniis lateralibus majoribus. Msrs. Loddiges flowered a Mexican plant (Nr. 794), which in so many respects corresponds with the now common *C. maculatum*, that I cannot regard it as more than a variety, but which never the less differs in having smaller flowers, with the lateral lobes of the lip so much larger, than usual as to give it a hastate appearance and with a frequent union between the lower sepals more or less complete. This circumst. breaks down yet more the limits between *Cyrtorchilum* and *Oncidium*.

Oncidium maculatum Denianum Rehb. fil. Bonpl. III. 215:

Labello ligulato acuto ante basin rotundatam utrinque extrorsum angulato.

Das vorliegende Blatt breit zungenförmig mit stumpfer Spitze. Das vorliegende Stück Inflorescenz ziemlich zwei Fuss lang, traubig, unten mit drei zweiblühigen Zweiglein. Hüllblätter gefärbt und gestaltet, wie bei *O. maculatum*, aber schmaler. Lippe zungenförmig, spitz, vor dem Grunde jederseits mit vorspringender Ecke, grünlich weiss, über der Mitte mit dunkelbraunem Bande; vom Grunde bis an dieses Band 4 niedrige, vorn lappige Kiele, welche am Grunde fleischig wulstig sind. Säule niedrig, häutig, schmal, oben und unten spitze Flügeln; untere Partie mit Längskiel und 2 Gruben wie *O. maculatum*. — Garten des Herrn Pescatore, cultivirt durch Herrn Lüddemann, und des Herrn Lennec Deman zu Bierbais, cultivirt durch Herrn Keilig.

Cyrtorchilum maculatum Lindl. var. *aristatum* Rgl. Ind. Sem. II. Petrop. 1855.

(*Cyrtorchilum aristatum* H. Petrop.):

Sepalis petalisque lineari-lanceolatis, flavis, pallide fusco-purpureo-maculatis; labello basi lamellis duabus, corniculis nullis; alis columnae utrinque arista unica sursum versa munitis. Cetera ut formae genuinae.

114. ONCIDIUM LINGUIFORME Lindl. Orch. Linden. 77. L. F. p. 34:

O. umbrosum Rehb. fil. in Bonpl. Ap. I. 1851!

Odontogl. umbrosum Id. in Linn. XXII. p. 848. Fol. Orch. Nr. 13.

A flower sent by Rehb. enables me to identify these synonyms. The plant has narrow leaves almost two feet long, and a weak branching panicle, the divisions of which are very thinly occupied by flowers, of a dirty yellow colour, with a wine-red lip and column. It flowered in 1854, with Sir Philip Egerton; and is not worth cultivation.

Wird in Venezuela; province of Merida, at 5000 ft. of elevation—Linden, 672; shady forests—Moritz, 1096.

Lindl. l. c. p. 14:

Foliis ensiformibus acutissimis panicula divaricata, sepalis lanceolatis patentissimis lateralibus unguiculatis disjunctis, petalis latioribus, labello linguiformi subrhombeo basi angustato lamellis 5 inaequalibus, columnae nanae alis rotundatis.

„An epiphyte from the province of Merida at the height of 5000'. Juli. Pseudobulbs oval compressed ribbed. Petals yellow. Lip rose colour. (Nr. 672). Leaves 18" long, and from $\frac{3}{4}$ —1" broad.

O. (Integrilabia) umbrosum Rehb. fil. in Bonpl. II. 142. *Odontoglossum umbrosum*

Rehb. fil. Linnaea, Lindl. Folia. *Odontoglossum cimiciferum* Klotzsch Hort. Berol. Semin. 1822. nec Rehb. fil.: panicula laxa diffusa, ramulis flexuosis (praesertim in planta spontanea), bracteae squamaeformibus membranaceis dilatatis tertiam seu quartam ovarii pedicellati aequantibus, perigonio patulo, sepalis lanceolatis acutis, tepalis oblongis acutis subfalcatis, omnibus viridiflavis, demum rufobrunneis, labello violaceo ab unguiculata basi pandurato retusiusculo, basi latiori, apice nunc bi-, seu trilobulo, carinis 2 bidentatis in basi, interposito denticulo, gynostemii humilis alis obtuse quadratis externo latere nunc minute crenulatis, tabula infrastigmatica producta. Merida, 5000'. Januar. Der weithin windende Blütenstengel rothbraun. Blüthe in Herrenhausen. — Caracas. Wägener.

Gardn. Chronicle 1854. 535:

A very ugly straggling small-flowered species with a green calyx and petals and a dull purple lip. It was found in New-Granada by Moritz, and has reached our gardens through some of the importers. It flowered the other day with Sir Philip Egerton. Mr. Reichenbach originally described it as an *Odontoglossum*, an error that he has since corrected. It is near the *Oncidium Lindleyi* of Galeotti, a Mexican plant not yet introduced.

115. *ONCIDIUM MENTIGERUM* L. F. p. 34:

O. panicula ramosissima elongata pyramidali, sepalis lateralibus elongatis petalisque lanceolatis acutis, labello sessili oblongo acuto carinis cristae 2 antrorsum attenuatis, columnae alis obsolete triangularibus buccis nullis.

Odontoglossum mentigerum Rehb. fl. in Bonpl., Ap. 15. 1844.

Of this species the habit is that of *O.* pyramidale. It has very small flowers on rather distant spreading or ascending branches. It approaches nearly the Myanthean *Odontoglossum*, to which Prof. Reichenbach perhaps refers it rightly, especially considering its resemblance to *Odont. megalophium*. The lip is certainly not three-lobed as Rehb. describes it. The flowers seem to be whole-coloured, with a paler lip,

Wild in Peru; sources of the Marañon—Warszewicz.

116. *ONCIDIUM MISERRIMUM* Rehb. in Bonpl., March, 1855:

This seems to be nearly related to the last, from which it differs in having a crest with two keels and three off-lying tubercles in front, very large, blunt, hatched-shaped column-wings, and the lateral sepals not very different from the petals.

Wild in Venezuela; Ocanna—Wägener.

Huc: *O.* (*Cimicifera ornithorrhyncha*) *miserrimum* Rehb. fl. in Bonpl. III. 66:

Floribus minutis hyalinis. labello ovato acuto, carina apice biloba in basi, tribus callis antepositis, callo medio quidem posteriore, alis gynostemii oblongis magnis.

Adest ramus paniculae basi ramulosus. Rami fractiflexi, pauciflori, bractae triangularae acutae ovarii pedicellatis quater breviores. Sepala cuneato-ovata acuta. Gynostemium tenue, tabula infrastigmatica paulo producta; dens erectus in limbo antico androclinii supra processum rostellarem dentiformi rostratum deflexum; fovea angusta oblonga; alae oblongae utroque apice obtusae hyalinae. Anthera longe rostrata. Ocanna. Wägener.

Huc includatur: *Miltonia* Lindl. Fol. I. 1853. Dec. 1. (B. R. 1977.):

Sepala explanata, aequalia, lateralibus basi paulo connatis. Petala conformia, aequilonga. Labellum indivisum, sessile, cum columna continuum, lineis quibusdam elevatis interruptis juxta basin. Columna nana, auriculis 2, nunc cum clinandrio cucullato confluentibus. Stigma excavatum. Pollinia 2, cereacea, postice sulcata; caudicula obovata; glandula oblonga. Anthera operculata, membranacea, nuda. Herbae epiphytae Americae tropicae, pseudobulbosae, colore saepius lutescente.

Folia angusta, plana. Racemi simplices, radicales, pedunculo saepius squamis arcte imbricato. Flores speciosi, lutei, vel purpurei.

The short column separates this genus from *Oncidium* and *Odontoglossum*; its auricles from *Brassia*. Its habit is peculiar. The section B bears the same relation to *Miltonia* as the §. *Trymenium* to *Odontoglossum*.

Nos contra in *Miltonia spectabili* Lindl. ac *Russelliana* Lindl. observavimus hos characteres omnino inconstantes, unde aliam ansam quaesivimus et ita quidem, ut licet artificialibus characteribus distantes, species similes consociatae fuerint.

A. Bracteae spathaceae ovario pedicellato aequales seu longiores.

Rehb. fil. l. c. 129.

a. Multiflora labello adnato.

116. — 1. — ONCIDIUM FLAVESCENS Rehb. fil. Mss. Huc: *Miltonia flavescens* Lindl. Rehb. fil. l. c. 129:

Pseudobulbus oblongoligulatus anceps diphyllus. Folia ligulata acuta. Basis bulbi vaginis distichis foliisque stipata. Pedunculi pars inferior anceps vaginis arctis vestita; pars superior obtusangulo flexuosa. Bracteae scariosae spathaceae acuminatae patulae flores aequantes excedentesve. Sepala ac tepala sublatisiora ligulata acuta. Labellum infra basin gynostemii adnatum panduratum acutum seu oblongum acutum a basi lato cuneata, margine undulatum ac minute crenulatum lineolis velutinis; linea antice bicurvis nunc a dente prosiliens in ima basi. Gynostemii tabula a labello semi-

tecta seu tota abscondita. Alae abbreviatae nunc lobulatae, nunc integrae infra foecae marginem infimum transcendentes (more *Oncidii Papilionis* Lindl.). In provincia Minas Geraës Regnell! Macahé and Bananal Descourtilz fid. ill. Lindley.

Huc: *M. flavescens* Lindl. Sert. sub t. 48. L. F. p. 3:

M. pseudobulbis diphyllis ovalibus ancipitibus, foliis ligulatis obtusis, scapo ancipiti arcte vaginato multo brevioribus, racemo disticho flexuoso, multifloro, bracteis carinatis convolutis acuminatis glumaceis ovario longioribus, sepalis petalisque linearibus acutis stellatis, labello ovato-oblongo undulato acuto basi pubescente canaliculato striato, alis columnae acinaciformibus integerrimis.

M. stellata Lindl. Sert. t. 48.

Cyrtochilum stellatum Lindl. Sert. t. 7.

Cyrtochilum flavescens Lindl. in Bot. Reg. t. 1627.

Flowers pale yellow with no spots. Lip white with yellow streaks. Wings of the column yellow streaked with crimson. Bracts rose-coloured. I believe, that my *M. flavescens* and *stellata* are the same species in different states, *M. stellata* being a very large vigorous specimen and *M. flavescens* a small starved one. The so-called Mexican habitat of the latter is certainly a misrepresentation of some nurseryman. It is singular, that the large form represented by Descourtilz in his drawings in the possession of M. Delessert, and on which *M. stellata* was founded, has nowhere occurred in the many collections of wild Brazilian plants, that have been submitted to me. Even Mr. Miers has in his herbarium nothing beyond a specimen from the Garden at Rio Janeiro.

Wild in Brazil; Minas Geraës—Regnell; Macahé and Bananal—Descourtilz.

Pedunculo ancipiti interrupte ancipiti vaginato, labello aequaliter pandurato acuto lamellis ternis in basi.

Miltonia Pinellii Hort. *Odontogl. anceps* Klotzsch in Otto und Dietr. Allg. Gartenzeitg. 1850. 250. (cum *Odontogl. constricto* comparatum!). Cf. supra *Xenia Orchidacea* p. 56. Tab. 21. Dorsum carinae non, alatum abruptumque uti in *Miltonia spectabili* Lindl.

Huc: *Odontoglossum anceps* Klotzsch l. c. p. 120:

Pseudobulbis oblongis compressis, versus apicem attenuatis, foliis binis, oblongis, apice oblique rotundatis subconduplicatis, ternis, racemo terminali, ancipiti, basi attenuato, unifloro, foliis longiore biarticulato, articulis distantibus, bracteatis, bracteis amplexicaulis, vagina bivalvi, membranacea, subarida, sordide carnea; germine stricto, tereti, inferne attenuato, perigonii foliolis lanceolato-oblongis, obtusis patenti recurvis viridiflavis, exterioribus lateralibus linea purpurea notatis, supremo interioribusque immaculatis; labello rhomboideo-lyrato, albo, apice recurvo, attenuato, brevi unguiculato, inferne lineis purpureis punctulisque oblongis appendiceque bidentato atque anteriore intermedio breviori instructo; gynostemio erecto apice brevi, bilobo, a flavido rubescente, infra apicem biauriculato.

Pseudobulbi laeves, 2 pollices longi, inferne 6 lineas lati, apice $3\frac{1}{2}$ lineas lati. Folia 4 pollicem longa, 6 lineas lata. Scapus anceps, $4\frac{1}{2}$ pollices longus, 2—3 lineas latus. Perigonii foliola pollicem longa, 2— $2\frac{1}{2}$ lineas lata. Labellum 15 lineas longum, in medio 10 lineas latum. Ab *Odontogl. constricto* differt perigonii foliolis obtusis, columna cirrhosa.

Brasilien. Allardt.

Huc: *Miltonia anceps* Lindl. Fol. sub Nr. 7. p. 3:

M. Pseudobulbis compressis versus apicem attenuatis, foliis binis oblongis apice oblique rotundatis, racemo ancipiti unifloro foliis longiore biarticulato, sepalis petalisque lanceolato-oblongis patenti-recurvis, labello rhomboideo-lyrato apice recurvo basi pubescente bilamellato dente intermedio brevioris adjecto, clinandrio circulari carnosio dentato.

Odontogl. anceps Klotzsch in Allgem. Gartenztg., Aug. 9, 1851.

„Pseudobulbs two inches long. Leaves four inches long, by six lines broad. Scape two-edged, four and a half inches long. Sepals an inch long, greenish yellow, the two side ones with a purple line, the upper and the petals without marks. Lip white with purple lines and spots at the base.“ Such is an abridgment of Dr. Klotzsch's account of his *O. anceps* which I entertain no doubt is the same as a Brazilian plant, which many years since flowered with the late Messrs. Loddiges, although the colour is somewhat different. In that plant the leaves etc., had the same scorched yellow appearance which characterizes *M. flavescens*. The sepals were dull yellow, linear, acuminate; the petals exactly the same except being much broader. The lip was yellow with a little tinged, brown near the base, and with three purple downy veins proceeding from the point of the downy lamellae. Of these there were three, completely confluent except at the point, and the middle one much shorter than the others. The anther-bed was expanded into a circular purple hood, white and toothed at the edge, and much longer, than the anther.

Wild in Brazil—Klotzsch; Loddiges.

116. — 3. — ONCIDIUM SPECTABILE Rehb. fil. Mss. Huc: Rehb. fil. Xen. I. 129: *Miltonia spectabilis* Lindl. B. Reg. 1837. sub 1976:

Flowers dingy greenish purple. Lip posterior, dull violet. Wings of the column yellow. Border of the stigma crimson.

116. — 7. — ONCIDIUM SPECIOSUM Rchb. fil. Mss. Rchb. Xen. I, p. 131: (*Miltonia cuneata* Ldl. Bot. Reg. 1844. (XXX.) Misc. 28. et 1845. (XXXI.) 8):

Labello a basi bene cuneata ovato lobato, carinis geminis per unguem in laminae basi abrupte obtusangulis, gynostemii alis magnis quadratis postice cucullato confluentibus, denticulatis.

Miltonia speciosa Klotzsch! in Otto u. Dietr. Allg. Gartenztg. Nr. 17. p. 129. (Aprili!).

Pseudobulbi ligulati ancipites diphylli. Folia ligulata acuta. Pedunculus pauciflorus. Bractee triangulae ovariis pedicellatis bene breviores. Sepala oblongolanceolata basi bene cuneata, paulo undulata; lateralia basi connata; tota rufusca, seu

apicibus flavida. Tepala latiora undulata apiculata. Labelli albi unguis basi gynostemii adnatus. Androclinium utroque apice acutangulum. Anthera velutina.

Brasilia?

Obs. *Miltonia speciosa* Klotzsch! herb. gen. berol. et l. c. nil sistit nisi specimen grandiflorum bene cultum ex horto Deckeriano. Haec est longa diagnosis: „Pseudobulbis ovato-oblongatis compressis, superne attenuatis bifoliatis pallide viridibus glaberrimis laevibus basi que distiche foliatis; foliis oblongis submembranaceis glaberrimis laete viridibus brevi-acutis, apice recurvatis, basi conduplicato attenuatis inaequalibus, subtus acuto carinatis; racemo tereti basilari erecto e viridi fusciscente remote bracteato foliis longiore bi — trifloro; floribus magnis patentibus; bracteis lanceolatis acuminatis tenuissime membranaceis fusciscentibus suffultis; perigonii foliolis oblongo elongatis breviter recurvato acuminatis stramineis undulatis fusco maculatis, basi attenuatis, interioribus maculis confluentibus, basi planis; labello magno candido plano rotundato bifido (N. 1.), dente acuto brevissimo interjecto subrepando elevatim ramoso venoso, basi cuneato truncato bilamellato cum pede columnae conato; gynostemio brevi crasso albido, antice roseo, angusto bialato, alis albidis; androclinio bilobatum marginato, lobis obtusis fimbriatis (N. 2.); anthera semibiloculari molliter-hispida.“

Ad N. 1. addimus calami lapsu hoc scriptum, cum labellum vix emarginato bilobulum in specimine originali dici possit.

Ad N. 2. addimus, non fimbriatum, sed denticulatum esse hunc limbum.

„Die Publication dieser schönen Acquisition haben wir wiederum dem Eifer, der Umsicht und Aufmerksamkeit des Herrn Obergärtner Reinecke zu danken, welcher das aus Brasilien lebend erhaltene Exemplar zur Blüthe brachte. Dieselbe ist der *Miltonia cuneata* Lindley zunächst verwandt, unterscheidet sich jedoch durch ganz glatte Scheinknollen (N. 1.), schmalere zurückgekrümmt-zugespizte Blätter (N. 2.), kleinere Blüthen (Nr. 3.), den zweilappig gefranzten Antherengrubenrand (N. 4.) und durch die stachel-zotige Anthere (N. 5.).“

Omnia haec nihil valent. Ad N. 1. pseudobulbi nuper introducti seu plantae loco siccio cultae costati, plantae loco humido cultae laeves. N. 2. Folia in omnibus his speciminibus omnino varia, ubi ab aliis depressa — recurvata; ubi libere culta — assurgentia; angustiora; latiora. N. 3. Flores speciminis typici majores, quam flos ab ill. Lindl. missus; lamina quidem paulo major in planta Klotzschiana, quam in icone Lindleyana. N. 4. Androclinium non fimbriatum, sed denticulatum; sinus posticus emarginatus vulgo occurrit et conspici potest in tribus infimis floribus iconis Lindleyanae. N. 5. Anthera velutina — aculeato villosa non est! — in omni *Miltonia cuneata* Lindley adest.

Lindl. Fol. p. 4: *Miltonia cuneata* Lindl. in Bot. Reg. 1844, Misc. 28., 1845. t. 8:

M. pseudobulbis ovato-oblongis, foliis oblongis striatis subundulatis, racemo plurifloro, bracteis elongatis glutaceis, sepalis petalisque lanceolatis undulatis, labello cuneato rotundato basi bilamellato utrinque subrepando, columna medio bidentata, clinandrio membranaceo cucullato denticulato repando retuso.

Flowers nearly four inches in diameter; sepals and petals rich brown tipped with green. The lip is pure white, with a tinge of pink near the base, in form different from *M. candida*, for it is scarcely curled at the edge, is much narrowed to the base; and has only one pair of plates instead of two and a half. The wings of the column too are scarcely divided, or at all events not at all notched.

Wild in Brazil?

b. Labellum carinato cristatum convolutum circa gynostemium.

Rehb. fil. l. c. p. 132.

116. — 8. — ONCIDIUM CANDIDUM Rehb. fil. Mss.; Xenia l. p. 132: *Miltonia candida* Lindl. Bot. Reg. 1838. (XXIV.) Misc. 29:

M. pseudobulbis ovalis apice angustatis diphyllis, foliis angustis racemo brevioribus, bracteis membranaceis concavis squamaeformibus, sepalis petalisque oblongis aequalibus, labello subrotundo crispo circa columnam convoluto basi 5-lamellato, columna pubescente basi biauri, clinandrio cucullato crispo membranaceo utrinque decurrente.

(A) Column purple, lip white.

(B) Column and lip yellowish. Bot. Mag. t. 3793.

Flowers in long erect racemes, very large; sepals and petals spotted with brown; lip white. One of the finest plants of the order.

Wild in Brazil.

Lindl. Bot. Reg. XXIX. (1843.) Misc. 411:

Of this fine plant a most beautiful variety flowers with Mr. Rucker, who purchased it at Hamburg. Its flowers are twice as large as those of the original variety, the lip is of a most brilliant white, and the sepals and petals are of a deep rich brown spotted towards the extremities only with yellow.

c. Labellum ecarinatum planum ovatum. Rehb. fil. l. c. p. 132.

116. — 9. — ONCIDIUM FUSCATUM Rehb. fil. Mss. Rehb. fil. Xen. l. p. 132: *Miltonia Warszewiczii*:

Adsunt ramuli duo flexuosi cum vestigiis caulis primarii, quorum alter quatuor, alter quinque bracteas naviculares acutas ovario pedicellato quater breviores gerit. Flores illis *Odontoglossi Karwinski* Rehb. fl. subaequales. Sepala ac tepala cuneato ligulata obtuse acuta margine crispula obscura (cinnamomea?). Labellum sepalis bene longius ovatum, oblongum flabellatumve, antice bilobum seu retusum cum apiculo, basin versus velutinum, duabus tertiis inferioribus obscurum concolor, anticum pallidum (cinnamomeum albumque?). Gynostemium crassum ac brevissimum, siccum vix lineam excedens. Androclinium postice angulatum angulum versus utrinque angulo insilienti; aptero marginatum; limbi foveae utrinque Miltoniarum more evoluti; dens rostellaris lineari retusus; tabula infrastigmatica margine superiori emarginato; lobo utroque laterali nunc simpliciter integerrimo, nunc paucicrenato; utrinque paucisulca-

tum; labellum mediae tabulae (nec lateribus) adnatum! — Planta mihi diu dubia, cum an ad *Oncidia*, an ad *Miltonias* melius ducenda, nescirem; nunc tandem cum proprio Marte, tum suadente ipso ill. Lindley huc ducta, cum utriusque nostrum novum genus non statuisset. — Detecta a nob. de Warscewicz.

Obs. Eandem specimen, seu valde affinem, jam diu novimus ex herbario Pöppigiano; sed statu deplorabili. Adsunt icon, specimen, scheda. — Icon profert plantam bipedalem. Folia stipantia tria, cuneato oblongo acuta. Pseudobulbus oblongus monophyllus, folio reliquis foliis aequali. Pedunculus paulo brevior nudus, apice biflorus, supra florem superiorem decisis, ebracteatus (*Tetradynamarum* more). Flos exacte idem, quem descripsimus, sed duplo major; sepala ac tepala pulchre undulata. Adscripta haec: „Bleibt weg. Blumen im Herbar zerstört gefunden.“ — „*Sobralia biflora* Ruiz. Pav.“ (omnia praeter „biflora“ radendo prope destructa. —) „*Diar. bot. N. 1765.* Genus pone *Catleyam* cf. *Icon. bot. Reg. t. 953.*“ Specimen videtur iconi inservisse. Pseudobulbus oblongo ligulatus levissime paucicarinatus, nitidissimus cicatrice folii latissima. Vaginae foliorum stipantium tres. Pedunculi vaginae glumaceae erectae sex; portio florida brevis. Bractee glumaceae tres illis plantae Warscewiczii bis terve longiores, scilicet duas pollicis tertias longae. Flos a vermibus prope destructus sepalorum tepalorumque spolia gerit pallidiora angustiora. Labelli — quondam vermibus delictiosi — residua labello plantae Warscewiczianae similia, nervorum rete idem. Folia cuneato oblongo acuta subpedalia, tres pollices lata.

Scheda haec offert: „1765. Pone *Catleyam*. Scapus 2—3 flor. Perianth. ex cinnamomeo flavescens, foliol. undulatis. Labellum sordide purpur. subrotundum, obcordatum, margine anteriore albo limbatum, medio discum incrassatum vernicosum ferens, appendice propria supra basin adactum, mediante eodem cum gynostemio ad stigma usque connatum. Gynost. breve, 3 quetr. truncatum. Poll. mass. 2, cereac. caudicula lineari glandulae stigmati conicae compressae acutissimae affixae.“

Cuchero Febr. 1830.

Huc includatur: *Brassia* R. Br. H. K. ed. 2. V. 215 Lindl. Fol. I. Decbr. 1853.

Sepala explanata, basi aequalia; lateralibus elongatis acuminatis saepius caudatis. Petala conformia, sepalo dorsali aequalia vel minora. Labellum planum, indivisum, cum columna continuum, basi bilamellatum, verrucis saepe antepositis. Columna nana aptera. Stigma excavatum. Pollinia 2, cereacea, postice sulcata; caudicula lineari arcuata; glandula ovali. Anthera *Oncidii*. Herbae epiphytae, pseudobulbosae, Americae tropicae. Folia pergamenea. Racemi radicales, simplices. Flores xanthini, speciosi.

A genus extremely near *Oncidium*, from which nothing in reality separates it except its very short, earless column, and entire bilamellate lip combined with elongated lateral sepals. The inflorescence of *Oncidium* is however usually branched. *Ada* is readily known by its closed perianth, lip, caudicle, and gland; *Miltonia* by its auriculate column firmly blended with the base of the lip.

Subdivisions of the genus.

S. A. *Eubrassia*. Bracts short and inconspicuous.

1. Lip quite even.

2. Lip verrucose.

S. B. *Glumaceae*. Bracts long, herbaceous.

§. A. 1.

116. — a. — ONCIDIUM BRASSIA Rehb. fl. Mss. Lindl. Fol. l. c. p. 1: *Brassia maculata* R. Brown in Hort. Kew., V. 215. Bot. Mag., t. 1691:

B. sepalis lateralibus labello duplo longioribus, petalis acuminatis labello subaequalibus, labello paulo brevior supra basin oblongam in limbum subrotundum expanso, lamellis disjunctis simplicibus apice dentiformibus basi villosis.

(A.) Flowers large, pale yellow, with a nearly white lip, spotted below the middle with purple.

B. guttatum Rehb. fl.: (B.) *guttata*. Flowers much smaller, and greenish, with spots distributed pretty equally over the surface.

B. guttata Lindl. in Plant. Hartw., 94.

B. Wrayae Hooker in Bot. Mag. t. 4003.

I am afraid there is no doubt about all these plants being the same. The identity of *B. maculata* and *guttata* has been overlooked, I presume, in consequence of the figure in the Bot. Mag. having been represented with revolute sepals and petals, a circumstance unknown among Brassias. I have lately had an opportunity of examining a specimen in the possession of his Grace the Duke of Northumberland, and I find that this part of the figure is wholly erroneous. The sepals and petals are straight, and in the usual state of disproportion remarked in the genus. It is much handsomer, and more rare than *guttata*; which, however, is a fine variety, with greenish yellow flowers spotted with purple or green; these vary greatly in size; in Hartweg's wild specimens from the Chono they are very small, in a specimen found by Mr. Skinner at San Salvador twice as large, and in a specimen before me, from the garden of the Horticultural Society, larger than even the last.

Wild A, in Jamaica—R. Brown, Purdie; B, Guatemala—Skinner, Hartweg etc.

116. — b. — ONCIDIUM SUAVEOLENS Rehb. fl. Mss. Lindl. Fol. l. c. p. 2: *Brassia lanceana* Lindl. in B. R. t. 1784. B. M. t. 3577. lb. 3794(?):

B. petalis labello aequalibus acuminatissimis, labello oblongo-lanceolato acuminato undulato basi pubescente, lamellis pilosis disjunctis proclivibus cornubus 2 cum dente intermedio antepositis.

(A.) Flowers bright yellow, sweet-scented, spotted with brown; the lip whole-coloured. Lateral sepals not twice as long as the lip.

(B.) *macrostachya*. Flowers bright yellow, slightly spotted with brown; lip much paler. Lateral sepals very acuminate, three or four times longer than the lip.

B. macrostachya Lindley Sert. Orchid. t. 6.

(C.) *pumila*. Flowers pale yellow, stained with dull purple at the base of the sepals, which are clear yellow. Lip contracted in the middle, dirty yellowish brown at base, more than half as long as the lateral sepals.

B. pumila Linden Bot. Beg. 1845. Misc. 62.

That all these plants are forms of the same species is I fear undeniable, notwithstanding the great differences in colour and the size of the parts, especially in the length of the lateral sepals, which in *macrostachya* are five or more inches long. All are very near *B. caudata* itself, but appear to want the subulate point of the lip, and the aristate sepals of that species. From *B. Lawrenceana* the three teeth (two like horns, one small and intermediate) standing upon the sloping lamellae may be regarded as the main differences. As to *pumila* which has pale yellow flowers stained with dull purple at the base of the petals, but no purple on the sepals, and the lip very slightly tinted, it is remarkable for a pair of somewhat transparent teeth which stand up in front of the two little customary lamellae.

Wild in the West-Indies; A. Surinam—Lance; B. Demerara—Loddiges; C. Caracas—Linden.

Obs. Brassia pumila Lindl. l. c.:

Foliis binis patulis elongato-lanceolatis, canaliculatis, sepalis linearilanceolatis acuminatis inferioribus labello longioribus, labello pandurato acuminato subundulato basi bicarinato dentibus ante carinas 2 acutis clavatis aucto.

Dwarf. Pale yellow flowers stained with dull purple at the base of the petals; but there is no purple on the sepals and the lip is very slightly tinted. It seems to be peculiar in the large size of the pair of somewhat transparent teeth which stand at the base of the lip; but it may be a var. of *Brassia Lanceana*. Its aspect is however widely diff. — Barker.

116. — c. — *ONCIDIUM LAWRENCEANUM* Rehb. fl. Huc Lindl. Fol. p. 2: *Brassia Lawrenceana* Lindl. in Bot. Reg. 1844, Misc. 6, t. 18:

B. sepalis lateralibus labello duplo longioribus, labello oblongo-lanceolato acuminatissimo undulato, lamellis 2 pubescentibus antice connatis truncatis.

(B.) *angusta*. All the parts very narrow; the lip aristate with a tendency to become concave.

B. cochleata Knowles and Westcott, Fl. Cab., t. 53.

B. angusta Lindl. in B. R., 1844, Nr. 3.

Except size and colour I find no safe mark by which to distinguish A and B. Both are very sweet-scented. The former has bright yellow flowers, spotted with cinnamon; the latter has all the parts narrower, they are dirty yellow with a uniform dull brown stain on the lower half of the petals, and a few dull brown spots near the base of the lip. Both are occasionally received among collections formed in Brazil; if *B. cochleata* is the same as *angusta*, which I can hardly doubt, then it would seem to be from Demerara. The truncate double lamella, with no additional teeth in front, affords an easy mode of identifying the species, and separates it especially from *B. Lanceana*.

Huc: *Brassia angusta* Lindl. Bot. Reg. 1844. (XXX.) Misc. 13:

Pseudobulbis oblongis ancipitibus, foliis binis oblongis sessilibus undulatis racemi longitudine, sepalis linearibus, acuminatis, labello lineari-lanceolato acuminato lamellis baseos connatis pubescentibus antice denticulo auctis.

Brazil.

Extremely narrow sepals and lip, which are of a pale dull yellow, with little marking, except a few brown spots at the base of sep., pet. and lip. In this respect it varies, for in some cases the spots at the base of the petals are few and distinct, in others they run together into brown.

Huc: *Brassia cochleata* Knw. Westc. Fl. Cab. II. 53. (1838):

Pseudobulbs ovate oblong, furrowed, the base clothed with sheathing leaves, the apex bearing 2 leaves. Leaves linear lanceolate, acute keeled. Scape racemose, pendulous. Sepals as petals plane, not undulated, pale green, elegantly marked with brown. Lip elongated, striated, marked with white and brown dots, somewhat constricted in the middle, then forming a spoon-like cavity and terminating in lengthened, somewhat recurved apex. Bractees small.

Demerara „on the banks of the Demerara river, some forty miles from its mouth.“ Henchman.

— *BRASSIA BIDENS* Lindl. cf. infra.

116. — d. — *ONCIDIUM CAUDATUM*. Huc: Lindl. Fol. p. 3: *Brassia caudata* Lindl. in Bot. Reg. t. 832. L. O. 212, Bot. Mag. 3451:

B. sepalis lateralibus longissimis acuminatissimis, petalis labello vix longioribus, labello ovato-oblongo apice subulato, lamellis pubescentibus apice liberis dentiformibus.

Epidendrum caudatum L. sp. pl., 1349.

Malaxis caudata W. sp. pl., iv. 93.

The shortness of the petals, which are not longer than the labellum, and the very great length of the lateral tail-like sepals are peculiar. The flowers are dull yellow, spotted with broad brown blotches. In Regel's Brazilian specimens, which are very ill-preserved and referred here with some doubt, the lip is obovate and extended into a long bristle-shaped point.

Wild in the West-Indies; Brazil—Regel?

116. — e. — *ONCIDIUM PERUVIANUM* Rehb. fl. *Brassia peruviana* Pöpp. Endl. Gen. Sp. II. t. 117. Lindl. Fol. p. 3:

B. foliis elongatis acutissimis, „sepalis anguste linearibus acuminatissimis aequalibus; floribus resupinatis, labello oblongo lanceolato acuto undulato crenulato“ sepalis subaequali unguiculato basi bicalloso.

I have never seen anything like this plant. The flowers are represented as growing in one-sided spikes, not exceeding ten in number, about an inch apart, yellowish-green spotted with purple. The perfect equality of the sepals and petals, if it really exists, is a very peculiar feature of the plant, as is also the unguiculate lip.

Wild in Peru; in dry thickets on the eastern face of the Andes, in the district of Chihuamccala, towards Cuchero—Pöppig.

116. — f. — *ONCIDIUM WAGENERI* Rehb. fl. Mss. Huc: *Brassia Wageneri* (Pandurabilis squamibracteata) Rehb. fl. Bonpl. I. 14:

Sepalis tepalisque linearilanceolatis setaceo acuminatis, his subaequilongis seu paulo brevioribus (in floribus infimis), labello a basi utrinque rotundata angustato, dein apicem versus rotundato dilatato demum in apicem longiusculum cuspidatum attenuato, carina basilari profunde sulcata, apice utrinque dentato truncata, basi velutina, carinulis triangularibus dentiformibus apici carinae appositis, ulterius progredientibus.

Eine stattliche Pflanze mit langen Trugknollen, über fusslangen, ziemlich spitzen Blättern. Die über fusslange Aehre trägt Blüten von der Grösse derer der *B. lanceana*. Sie sind nach dem beiliegenden Gemälde hellgrün, die Tepala am Grunde schwarzbraun, die untere Hälfte der Lippe mit schwarzbraunen Fleckchen. Ich lege besonderes Gewicht bei Aufstellung dieser Art auf die langen Tepala, welche länger oder gleichlang sind mit der ausgezeichnet fein gespitzten Lippe. Caracas. 5000'. April. Wagener.

116. — i. — *ONCIDIUM BRACHIATUM* Rehb. fl. Mss. *Brassia brachiata* Lindl. Pl. Hartw. 94. B. R. 1847. n. 29. Lindl. Folia l. c. p. 4:

B. sepalis longissimis (semipedalibus), labello verrucoso basi rotundato dimidio superiore subcordato acuminato undulato vena media leviter carinata, lamellis simplicibus glabris apice triangularibus erectis.

The finest species of the genus, with pale green flowers, studded on the lip with green warts, and many rich brown oblong spots on the sepals and petals. I have seen cultivated specimens measuring twelve inches from the point of the dorsal sepal to that of one of the laterals. The wild specimens are much smaller. The great heart-shaped upper half of the lip, and the smooth lamellae, clearly distinguish the species from *B. verrucosa*.

Wild in Guatemala; Hacienda de la Laguna—Hartweg.

Huc: *Brassia brachiata* Lindl. (Verrucosae) Rehb. fl. Bonpl. III. 215:

Aff. *B. verrucosae* labello a basi late ligulata cordato acuto, papuloso, carinis 2 parallelis nec contiguis, in basi vere continuis; apice acutangulis, basi intus velutinis.

Sepala lanceo acuminata semipedalia. Tepala subaequalia tres quartas illorum attingentia. Labellum a basi late cuneata ligulatum margine crispulum revolutum antice hastato triangulum utrinque rotundatum crispum. Carinae 2 parallelae a basi altiori rotundata non interrupti antice angulati, basi intus velutini. Verrucae crenaeque incrassatae per discum. Gynostemium humile. Perigonium citrino-albidum. Partes inferiores atropurpureo guttatae. Labellum aequale, basi carinarum intus aurantiaca. Flos demum per labelli discum purpureus more *B. verrucosae*. Klein blüthige Formen sind sehr häufig in unsern Sammlungen — die ganz grossblüthige erhielten wir nur aus Hrn. Pescatore's Sammlung.

116. — k. — ONCIDIUM VERRUCOSUM Rehb. fl. Mss. Lindl. F. l. c. p. 4:

B. sepalis lateralibus longissimis, petalis anguste caudatis, labello obovato-lanceolato acuto verrucoso, lamellis villosis antice bidentatis recurvis.

? *B. odontoglossoides* Klotzsch in Bot. Ztg. 1847, p. 942.

B. coryandra Morren in Ann. Gand., IV. 295.

B. Cowani Hort.

Flowers many times larger than in *B. aristata*, on long slender scapes, pale green except the lip which is white with green warts. It is impossible to doubt that Morren's *B. coryandra* is to be referred here, for although in his specific character, speaking of the lip, he says, „tuberculis nullis,“ yet this is entirely contradicted in his French text. Since no such *Brassia* is known to inhabit Brazil, the statement that the plant came from St. Catharine seems to have been a mistake.

Wild in Guatemala—Barker.

Huc: *Brassia aristata* Lindl. l. c. p. 4:

B. sepalis lateralibus labello quadruplo longioribus, petalis brevioribus ex ovata basi acuminatis aristatis, labello obovato basi angustato sub apice aristato secus medium verrucoso: lamellis glabris apice liberis (nunc bidentatis) divergentibus rotundatis.

B. longiloba Alph. DC., 10 not. pl. rar. Genev. t. I. A. (1847.)

Flowers among the smallest in the genus; according to M. De Candolle with a white lip and green sepals and petals slightly spotted with purple. Very distinct in the petals ending in bristle points and in the presence of a distinct awn beneath the point of the obovate warted labellum.

Wild in Guatemala—Skinner.

116. — l. — ONCIDIUM BIDENS Rehb. fl. Mss. Huc: *Brassia bidens* Lindl. B. R. 1844, Misc. Nr. 6. L. F. p. 3:

B. sepalis lateralibus labello duplo longioribus, labello rhombeo undulato petalis brevioribus, lamellis laevibus rectis appendice membranacea biloba in fronte.

This is nearly allied to *B. caudata*, from which it differs in its longer petals, in the form of its lip, and in having two large teeth connected at their base in front of the lamellae, which are quite smooth. The lip is spotted with brown on a yellow ground. The sepals and petals appear from the dried flower to be unspotted. Regel's specimen is much mutilated, but seems to belong here.

Wild in Brazil—Harrison; Regel Nr. 694.

§. B. Glumaceae Lind l. c.

BRASSIA CINNAMMOMEA Lind. = *Onc. Keitianum* Rehb. fl. N. 116. — q. —

116. — m. — ONCIDIUM OGANENSE Rehb. fl. Mss. — Lindl. F. p. 5.: *Brassia ocanensis*:

B. racemo paucifloro, bracteis herbaceis acuminatis ovario multo longioribus, sepalis carinatis petalisque ovato-linearibus obtusis carnosus recurvis subaequalibus, labello oblongo acuminato basi cuneato lamellis convexis pilosis dentibus 2 subrotundis glabris antepositis.

Resembles *B. glumacea*, but the bracts are longer, the sepals and petals short blunt, and the front teeth of the lamellae almost globular.

Wild in N. Grenada, in the province of Ocanna—Schlim.

116. — n. — ONCIDIUM GLUMACEUM Rehb. fl. Mss. Lindl. Fol. p. 5.: *Brassia glumacea* Lindl. Orch. Lind. p. 17:

B. racemo paucifloro, bracteis herbaceis carinatis ovario aequalibus, sepalis linearibus acuminatis subaequalibus, petalis conformibus bre-

rioribus, labello brevi ovato-acuminato convexo, lamellis glabris depressis apice obtuse runcinatis.

Flowers yellow spotted with red. The lamellae are perfectly smooth. Leaves not longer than the racemes, scarcely an inch and quarter broad.

Wild in Merida; from damp forests at the height of 5600 feet—Linden, 646.

116. — o. — *ONCIDIUM IMBRICATUM* Rehb. fl. Mss. — L. F. p. 5: *Brassia imbricata*:

B. racemo paucifloro foliis brevioribus squamis imbricatis acuminatis vaginato, bracteis herbaceis carinatis ovario aequalibus, sepalis petalisque a lata basi setaceo-acuminatis, labello oblongo plano acuminato lamellis pubescentibus depressis apice in dentes assurgentibus.

Very like a larger form of *B. glumacea*; but the leaves are not only full two inches wide, but much longer than the flowering stems. The sepals and petals are also finer pointed, and the lamellae are conspicuously downy.

Wild in Sa. Martha—Purdie.

Rehb. fl. Bonpl. III. 66. Pflanze wie die der *Brassia Keiliana* Rehb. fl. Blüthe braun gefleckt. 5000'. Ocanna, Wagener.

117. — p. — *ONCIDIUM CINNABARINUM* Rehb. fl. Mss. Huc: *Brassia cinnabarina* Lind. Mss. Lindl. Fol. p. 16:

B. bracteis ovalis cordatis acutis ovario brevioribus, sepalis petalisque lanceolatis acutis, labello oblongo lanceolato acuminato glabro lamellis flexuosis venas incrassatas referentibus medio dente obtuso auctis.

Flowers very brilliant orange-red, an inch and half long before expansion. The lamellae have the appearance of a pair of thick veins extending to two-thirds the length of the lip, and furnished each with a blunt tooth about the middle.

Wild in New-Granada; in the provinces of Soto and Ocanna at the height of 9000 feet—Schlim, 1035.

Rehb. fl. Bonpl. II. 280: Ocanna, Januar 5—6000'. Eine durch brennendes Roth und schöne Deckblätter höchst ausgezeichnete Pflanze. Nr. 403. Schlim.

Rehb. fl. Bonpl. III. 66. Ocanna. März. 5000'. Wagener.

116. — q. — *ONCIDIUM KEILIANUM* Rehb. fl. Mss. Huc: *Brassia Keiliana* Rehb. fl. in Paxt. Fl. Gard., 1852, Nr. 585. B. Z. 1852, p. 761. L. F. p. 6:

B. spica pauciflora, bracteis navicularibus ovaria superantibus, sepalis lineari-lanceolatis acuminato-aristatis petalis brevioribus, labello oblongo-lanceolato undulato acuminato, lamellis erectis utrinque obtusangulis basin versus velutinis antice in auriculas excurrentibus, columna basi angustata.

Sepals yellow, then beautifully brownish orange; cinnabarine when dried, lip whitish. Very near *B. cinnabarina*, from which it is readily known by its long navicular bracts.

116. — r. — *ONCIDIUM SPATHACEUM* Rehb. fl. Mss. Huc: *Brassia spathacea* Lind. Rehb. fl. Bonpl. II. 279:

Aff. *Brassiae imbricatae* Lindl. vaginis pedunculi distantibus, bracteis spathaceis acutis flores integros aequantibus, labello ovali acuminato acuto ante carinas geminas postice obtusangulas, antice unidentatas puberulas disco incrassato.

Folium oblongoligulatum acutum prope tres pollices latum, subbipedale. Pedunculus folio aequalis, basi vaginis duabus, dein racemo septemfloro. Sepala ac tepala subaequilonga lanceolata acuminata pollicaria, flava, rufo maculata. Labellum duas tertias sepalorum aequilongum. Gynostemium basi membranaceo dilatatum (more *Br. cinnabarinæ* Linden). — Wälder Ocannas: 6—7000'. Juli. Nr. 735. Schlim.

116. — s. — ONCIDIUM HELENÆ Rehb. fl. Mss. Huc: *Brassia Warscewiczii* Rehb. fl. in Bot. Zeit., 1852, Oct. 1. Lindl. F. l. c. p. 6:

B. bracteis triangulis concavis acutis pedicellis brevioribus, petalis a lata basi acuminatis labello aequalibus, labello medio velutino oblongo acuminato basi cuneato lamellis distinctis apice retrorsum falcatis puberulis.

Flowers said to be the size of *B. glumacea*. The velvety lip is very peculiar. The upper sepal is described as being lanceolate acuminate with a broad base.

Wild in Equador; near Punt St. Helena and Tipi Happa—Wewtz.

Brassia Warscewiczii Rehb. fl. l. c. p. 693:

Pedunculo multifloro (—15.), floribus parvulis (illos *Br. glumaceae* aequantibus), inversis, secundis, bracteis triangulis, concavis, acutis, pedicellos non aequantibus, perigonii phyllo supremo lanceolato acuminato, basi dilatato, phyllis lateralibus externis subaequalibus, longioribus, lateralibus internis triangulo-lanceolatis, a lata basi acuminatis, quam phylla externa brevioribus, labello aequalibus, labello oblongo acuminato, basi cuneato, per totum discum valde velutino, lamellis baseos distinctis, basi rotundato-elevatis, apice retrorso-falcatis, papillis puberulis; gynostemio humili a foveae stigmaticae basi labellum versus antrorsum oblique decurrente.

Die Blüthentraube gewährt die Erscheinung, dass die unteren seitlichen Hüllblätter alle nach einer Seite, die oberen nach der anderen gelegt sind. — Ich kann mit dieser Art nur zwei in Beziehung bringen, die obscure *Br. pumila* Barker scheint Herr Prof. Lindley mit der mir wohlbekannten *Br. angusta* für identisch zu halten (very near *Brassia angusta*). Sie hat ein labellum panduratum und vor den Kielen keulige Zähne. *Br. glumacea* dagegen zeichnet sich durch die sehr langen Deckblätter und bedeutend langgestielte Fruchtknoten sogleich entschieden aus, auch hat sie eine ganz kahle Lippe. Ecuador am Punt St. Helena und bei Tipi Happa. 1000—2000. April.

116. — t. — ONCIDIUM RACEMOSUM Rehb. fl. Mss. Huc: *Solenidium* Lindl. Orch. Linden. 1846. N. 79. p. 15:

Sepala et petala aequalia, explanata, libera. Labellum ungue longo canaliculato apice bidentato, lamina subrotundo ovata obtusissima. Columna aptera haud pede producta, alata, apice biloba, lobis lateralibus rotundatis dorsali lacero. Pollinia 2, cereacea, in caudicula incumbentia, glandula parva subrotunda.

Folia ensiformia, tenuia, basi angustata. Racemus laxis multiflorus. Bracteae minutae, pedicellis gracilibus, sigmoideis pluries breviores.

This curious genus is near *Oncidium* and *Brassia*, from both of which it is distinguished by its narrow stalked wartless lip, threelobed antherbed, and very peculiar pollenmasses, which are bent down upon their caudicle while in the anther.

Solenidium racemosum. „An epiph. from forests near Pamplona, at the height of 8500'. Nov. Flowers yellow, spotted with red.

Pact. Fl. G. III. 102: The main difference between *Solenidium* and *Oncidium* consists in this: column is earless, has a thin membranous border, terminating upwards in a thin triangular tooth, and rounded off above the base; beneath the lower end of the column stand a pair of distinct but minute glands, which must be analogous to the column ears of *Oncidium* if there is any analogy between them. The crest of the lip which in *Oncidium* is amplexed of 3 or some other uneven number of tubercles is here replaced by a pair of long feathery plates, which stand considerably above the lip itself, and being free at the end look in profile like a pair of shaggy ears. All this is very unsuccessfully represented on our plate.

Ex „*Leochilus*“ huc pertinent:

116. — u. — *ONCIDIUM HERBACEUM* Rehb. fil. Mss.: *Leochilus herbaceus* Lindl. Bot. Reg. XXX. (1844.) Misc. 90:

Labello obovato emarginato apice denticulato medio convexo laevi basi excavato villosa.

La Guayra imp. by Wailes of New - Castle. Sepals and petals are green with a single red stripe along the middle. The lip is white slightly tinged with green and irregularly banded with pale purple. It differs from *L. oncidoides* in the form and surface of the lip. I believe too that the flowers are in pairs; but I have only seen fragments.

116. — v. — *ONCIDIUM SCRIPTUM* Rehb. fil. Mss.: *Cryptosanus* Scheidw. Gartenztg. 1843., p. 101. Lindl. B. R. XXIX. (1843.) Misc. 122:

Perianthium explanatum, sepalis petalisque subaequalibus, sepalo supremo fornicato, labello indiviso oblongo apiculato, disco calloso, cum basi columnae accreto, saccato; sacculi ore ciliis densis cincto; columnae brevis clavatae apice auriculato. — Anthera unilocularis, pollinia 2, pyriformia postice sulcata, caudicula subulata, glandula oblonga.

Pseudobulbs oneleaved, compressed, twoedged. The leaf is lanceolate, coriaceous, opaque, mucronate. The racemes are axillary; the bracts subulate and very small; flowers 2—3 on each stalk, scentless, small, green, with sanguine spots and lines.

Huc: *Leochilus scriptus* Rehb. fil. Xen. I. p. 15, Tab. 6. IV. 24:

Affinis *L. herbaceo* labello apice integro basi carinato, carina apice et basi biloba, basi papillosa villosa.

Cryptosaccus scriptus Scheidw.! (errore typographico *Cryptosanus* legitur) Allg. Gartenztg. 1843. p. 101.

Pseudobulbi compressi, ancipites monophylli, folium lanceolatum mucronatum coriaceum. Racemus axillaris bi-triflorus. Bracteae subulatae brevissimae. „Flores inodori, virides: sepala sanguineo longitudinaliter unistriata, tepala aequaliter striata et cum labello sanguineo guttulata“ (Scheidw. l. c.). Sepala oblongo lanceolata acuta; tepala subaequalia angustiora, breviora. Labellum cuneato obovatum apice retuso bilobum: callus a basi per tertiam infimam apice et basi obtuse bilobus, pube papillosa inter lobos basilares; gynostemium medio utrinque lineari obtuseque divaricato brachiatum.

116. — w. — *ONCIDIUM CARINATUM* Knowl. Wescott. Fl. Cab. II. 1838. p. 31:

Pseudobulbis ovatis; foliis lanceolatis, scapo erecto, floribus secundis racemosis; petalis conniventibus, maculatis; pedicellis flexuosis; labello cristato integerrimo; bracteis scariosis.

Although not strictly agreeing with the generic character of *Oncid.*, we consider it one of those exceptions mentioned by Dr. Lindley, in the Bot. Reg. which come too near it to be separated. It differs from *O.* in having the wings of the column in the centre instead of the apex; but the pollenmasses, caudicula and gland are certainly those of *Oncid.* The labellum is also entire and keeled from the apex. It appears allied to *O. gracile*. Xalappa.

Leochilus carinatus Bot. Reg. 1842. Misc. 22:

Oncid. carinatum Knowles and Westcott l. c.

Pseudobulbis ovatis, foliis lanceolatis, scapo erecto, floribus secundis racemosis, sepalis petalisque linearibus disjunctis, labello lineari oblongo emarginato basi mellifero cristato, lamellis 2 brevibus truncatis utrinque glandulis 2 filiformibus auctis.

Xalappa in Mexico.

Flowers orange, petals spotted, the sepals wholecoloured, the lip yellow with a few orange spots.

§. 9. Pulvinata Lindl. l. c. p. 35.

Analysis of the species.

Pulvinus villosus inappendiculatus.

simplex.

labelli lobis lateralibus serratis	117. <i>sphegiferum.</i>
" " " crispis	118. <i>pulvinatum.</i>
quadrilobus, lab. lob. lat. integris	119. <i>divaricatum.</i>
<i>Pulvinus dentibus 5 ascendentibus circumdatus</i>	120. <i>Harrisonianum.</i>

117. ONCIDIUM SPHEGIFERUM Lindl. in Bot. Reg. 1843., Misc. 23. Paxt. Fl. Gard., II. ic. 124:

Flowers brilliant yellow, with rich crimson spots on the lip, and a dull purple stain on the sepals and petals. Base of the lip flat and serrated, not crisp; cushion-like crest, oblong obovate, not circular.

Wild in Brazil—Loddiges etc.

Lindl. l. c.:

Panicula ramosa divaricata, sepalis distinctis acutis, petalis retusis, labelli lobo intermedio bilobo transverse oblongo unguiculato lateralibus serratis subaequalibus, tuberculo villosa ovato pulvinato, columnae alis firmis rotundatis.

A Brazilian species, intermediate as it were between *O. divaricatum* and *pulvinatum*, of which it has quite the appearance and colour; it is however clearly distinguished by the lateral lobes of the lip being serrated, and by the rounded firm purple wings of the column. Flowered with Messrs. Loddiges.

118. ONCIDIUM PULVINATUM Lindl. in Bot. Reg. 1838. Misc. 115, 1639. t. 42. Paxt. Fl. G., II. ic. 126:

Much like the preceding, from which the crisp base of the lip, circular cushion, and broad middle lobe of the lip appear to separate it.

Wild in Brazil; Minas Geraës—Regnell.

Lindl. E. R. l. c. Misc. 115:

Panicula ramosissima divaricata, sepalis obovatis, lateralibus liberis, petalis conformibus acutis, labelli lobis subaequalibus, intermedio bilobo undulato lateralibus crenatis rotundatis crispis, disco pulvinato villosissimo, columnae alis rotundatis.

Resembles *O. divaricatum* with a panicle 8—9' long, imported from Brazil by Rich. Harrison, Esq. of Aigburgh, to whom a medal was awarded for his exhibition of it at a recent meeting of the Hort. Soc. of London.

Hook. Lond. Journ. 1842. 1. p. 159: on large trees, in virgin forests, on the Corcovado. Septbr. Gardner.

Lindl. Bot. Reg. XXV. (1839.) 42:

Panicula ramosissima intricata, glabra, 8—9' longa; axi percurrente rectiusculo, pennae corvinae crassitudine, ramis simplicibus ramosisque divaricatis, geniculatim flexuosis internodiis pollicaribus, bracteis refractis membranaceis acutis pluries longioribus.

Flores *O. divaricati* simillimi, lutei, in medio sanguineo guttati. —

It differs from *O. divaricatum* in its lip having the middle lobe largest, not smallest; and in the cushion at its base being much more villous and equally convex, not divided into equal quarters. The lateral lobes of the lip are also crisp in this species, not plain, as in *O. divaricatum*.

Lindl. Sert. sub 48: perhaps a variety of *Oncidium divaricatum*.

Huc: *Oncidium sciurus* Scheidw. Allg. Gartztg. 1839 p. 496:

Petala et sepala aequalia, ovata, apice mucronulata, sepala concava, libera, omnia unguiculata, flava, ad basin fusco purpurea, labellum trilobatum, lobis lateralibus rotundatis, maculis rotundis purpureis variegatis, intermedio amplissimo, reniformi undulato cuprato, postice maculis binis transversis, discus barbatus, aurantiacus, albovariegatus. Columna alba, alata, apice parum incrassata, rostellum porrectum, figuram sciuri refert. Folia maxima, 12—14 pollicaria, lanceolata, basi plicata, carinata, carnosa; scapus radicalis debilis, ramosus, quinquepedalis et ultra. Flores speciosi, subpollicares, lutei, fusco-purpurei maculati.

Brasilia. c. at Laeken. Scheidw.

119. *ONCIDIUM DIVARICATUM* Lindl. Orch. 205. Bot. Reg. t. 1050. Bot. Cab. t. 1212:

The short concave coriaceous leaves assist in separating this from the preceding, as does the entire flat edges of the lateral lobes of the lip. I also believe the four lobed cushion to afford a good mark. The flowers are sometimes yellow with a great deal of copper-red staining and spotting, and sometimes of one uniform dull coppery tint.

Wild in Brazil; trunks of high trees, on the mountains of Serra das Argoas, in Ilha Grande—Descourtilz.

120. *ONCIDIUM HARRISONIANUM* Lindl. Orch. 202. Bot. Reg. t. 1569. L. F. p. 35:

O. pallidum Lindl. in Bot. Reg. 1840, Misc. 108.

O. pantherinum

O. pentaspitum

O. raniferum Hort. Germ., fide Klotzsch.

O. acrobotryum Klotzsch, in Allg. Gartenztg. Sept. 15, 1855.

The dull grey horn-like recurved leaves, and most remarkable crest, render it impossible to mistake this pretty little plant, whose brilliant yellow flowers are enlivened by rich crimson linear stains. It is not very unusual for *Oncidia* to have a terminal inflorescence, as in the *O. acrobotryum* of Klotzsch, which is unquestionably a mere monster of this.

Wild in Brazil; Organ Mountains—Miers; on the ascent of the S. de Piedade, province of Mines—Martius.

Bot. Reg. l. c.:

Pseudobulbi ovi passerini magnitudine, sed globosi, laete virides, laeves. Folia 4—6 pollices longa, omnino avenia. Scapus e squama tubulosa proveniens, ascendens, pedalis vel ultra. Panicula composita, apice cernua, ramulis divaricatis vel decurvis. Flores vitellini. Sepala petalis paulo majora, atrofusco maculata (uti pet.) Labellum unicolor, sepalis lateralibus longius. Crista e tuberculis 5 constat, quorum 4 lateralia, compressa, rotundata, leviter incurvantur; quintum anticum multo est angustius et cornu parvum refert; inter omnia adest area pulvinata pubescens.

Oncidium pallidum Lindl. Bot. Reg. XXVI. 1840. Misc. 108:

Pseudobulbo obcordato compresso marginato, foliis acute carinatis convexis oblongis caesiis, scapo erecto paniculato, sepalis petalisque oblongis obtusis liberis, labelli auriculis rotundatis lobo intermedio cuneato obovato emarginato angustioribus, disci basi glandulosi appendice 5 partita; laciniis cornutis aequalibus pubescentibus, columnae alis brevissimis oblique truncatis.

Brazil. imp. Lucombe, Pince & Co. of Exeter. Laeves sea green like those of *Maxillaria Rollissonii*; the panicle is almost a foot long, and the flowers are in colour similar to *O. divaricatum*. Very near *O. Harrisonianum*.

§. 10. Paucituberculata. L. F. p. 36.

*: The following plants are all that properly belong to this division. They have never an uneven number of lobes to the crest. *O. serpens* has two—and the others four. If in some other instances there are four principal tubercles only, it will be found that rudimentary ones occur either in front or at the sides, and indicate a tendency to the formation of five or more.

121. ONCIDIUM SERPENS. Lindl. Orch. 204. Paxt. Fl. G., II. ic. 125. L. F. 36:

This must be extremely rare, no other specimen having occurred among the numerous Peruvian collections seen by me, except that gathered by Col. Hall. The flowers are said to be yellow, spotted with dark brown.

Wild in Peru; Patacocha, road to Esmeraldas at 6000 feet, on trunks of trees—Hall.

122. ONCIDIUM HANS Lindl. in Bot. Reg. 1838, misc. 124. Lindl. Fol. p. 36:

O. quadricorne Klotzsch in Allg. Gartenzeit., Aug. 7, 1852.

O. leucostomum Hoffingge. fide Rehb. fl.

A little species with small yellow brown flowers, and a great fleshy white erect four-lobed crest. The stigma is rostrate. The column has no cheeks.

Wild in Brazil—Hort.

Lindl. l. c. M. 124:

Sepalis petalisque aequalibus ovalibus obtusis leviter concavis, labello angusto auriculato medio contracto apice bilobo, callo disci bilobo utrinque dentato carnosio papilloso erecto columna parallelo eique longitudine aequali, alis columnae carnosae acutis vix falcatis.

I have only seen flowers of this little species, which comes near to *O. carinatum*. Messrs. Rollissons received it from the vicinity of the gold mines in Brazil. It has small yellow and brown flowers with an extraordinary appendage to the lip, erect, white, fleshy, as long, as the column, parallel with that organ, and resembling the 4 fingers of the hand a little hollowed out and closed together. This is quite a new modification of structure.

Huc: *Oncidium quadricorne* Kl. l. c.:

Pseudobulbis lenticularibus parvis monophyllis, foliis carnosis linearioblongis recurvis, acutis sessilibus, dorso carinatis, basi attenuatis dupliciter, paniculis basilariibus erectis filiformibus, perigonii foliolis patentissimis oblongo-obovatis sordide flavidofuscescentibus, labello elongato pandurato stricto, albido apice bifido, lobis lateralibus obsoletis, crista basilari erecta alba quadridentata, columnae nanae candidae alis erectis ovatis. — Labellum album.

123. ONCIDIUM STRAMINEUM „Lindl.“ in Bot. Reg. 1838. Misc. 63; 1840. t. 14. L. F. 36:

O. Columbae Hort.

O. Columbae Hort. } fide Rehb.

O. Lindeni Hort. }

Flowers straw-coloured, with a few dark specks on the lip, in a dense panicle.

The sessile almost rectangular petals are very remarkable.

Wild in Mexico; near Vera Cruz—Hartweg.

Lindl. Bot. Reg. XXIV. (1838.) Misc. 63: *Oncidium stramineum* Bat. in litt.:

Ebulbe, foliis crassis carnosis ovato-lanceolatis acutis dorso rotundatis scapo paniculato rigido erecto brevioribus, sepalis subrotundis unguiculatis concavis liberis integerrimis, petalis duplo majoribus oblongis obtusis emarginatis margine crispis, labelli lobis lateralibus oblongis carnosis margine revolutis basi columnae proxima nectariferis intermedio reniformi plano emarginato majoribus, tuberculis disci 4 ge-

minatis, columnae alis carnosis linearibus obtusis elongatis genuflexis decurvis.

Sent from the neighborhood of Vera Cruz to Hort. Soc. by their collector, Mr. Hartweg. Pale straw-coloured flowers; about as large as those of *O. flexuosum*, with a faint smell of primroses. The base of the lower sepals, the lower part of the lip, the column, and a line along the origin of the petals are neatly dotted with brown. Honey is secreted by the lip at the base of the lateral lobes, next the column. Young plants are very like *Oncidium pumilum*, for which they may be mistaken, but they have much thicker leaves.

Bot. Reg. XXVI. 1840. 14: It was one of the first plants sent from Vera Cruz to the Hort. Soc. by Mr. Hartweg, who found it at a place called Zacuapan, where some other fine things (especially the rare and beautiful *Berberis tenuifolia*) were obtained. This species is readily known when out of flower by its rigid fleshy unspotted leaves rounded, not keeled, at the back.

124. *ONCIDIUM CHEIROPHORUM* Rchb. fl. in Bot. Zeitg. 1852. p. 695. Xen. ined. Lindl. Fol. p. 36:

A very curious plant nearly allied to *O. stramineum*. Flowers not a quarter the size, clear yellow, whole-coloured. Column with large falcate wings, curved downwards as in the *Sarcopterous Plurituberculata* race, but not at all fleshy; in front it has a strong recurved tooth. Stigma rostrate. Crest of lip membranous, arched, and two-lobed in front, with a pair of teeth at its base. It exists in Senator Jenisch's garden in Hamburg.

Rchb. fl. l. c. 695:

Phyllo summo oblongo cuneato, acuto, reliquis subaequalibus, lateralibus internis tamen paulo latioribus, labello basi utrinque acute auriculato, dein trilobo, utrinque in alam obtuse ligulatam divaricatam expanso, lobo medio producto subsessili bilobo, multo angustiori; callo depresso papyraceo antrorsum quadrilobo inter lobos divaricatos; gynostemii gracilis alis dolabriformibus, antrorsum minute serratis, falcula sursum curvata in basi gynostemii; anthera ac rostello ornithorrhynchis.

Niedliche Art. Blüten „gelbgrün“; Lippe schön gelb, fast so gross wie die des *O. ornithorrhynchum*, mit dem die Pflanze grosse Aehnlichkeit besitzt. Trugknollen „rund, zweischnedig“; Blätter länglich, schmal, spitzlich; Rispe armbüthig, kurz-zweigig, zart. Der Haken an der Seite ist ein neues Attribut, viel ausgezeichneter als die Zierrath bei *O. planilabre* Lindl.

Rchb. fl. l. c. 924: (basilata!). Diese Pflanze blüht jetzt bei Herrn Senator Jenisch unter der Cultur des Hrn. Kramer. Sie hat ein höchst eigenthümliches Ansehen. Das obere Hüllblatt deckt helmig die Säule, die seitlichen Lippenlappen stehen vertical herabgeschlagen, der Mittellappen der Lippe ist seitlich eingerollt. — Der wunderbare Zahn ist weiter nichts, als die bekannte unternarbige Leiste, welche auf überraschende Weise vorwärts und abwärts geschoben ist. Farbe dottergelb, äussere Hüllblätter grünlich, die seitlichen, unteren liegen neben einander, mit breiter Fläche an einander gedrückt unter der Lippe.

Wild in Veragua; volcano of Chiriqui—Warscewicz.

125. *ONCIDIUM WARNERI* Lindl. Fol. p. 36:

Odontoglossum Warneri Lindl. in Bot. Reg. 1845. Misc. 54; 1847. t. 20.

(A) *sordidum*. Sepals and petals yellowish, streaked with purple.

(B) *purpuratum*. Sepals and petals white, streaked with bright purple.

A plant with conical caespitose pseudobulbs, and recurved grassy leaves, longer than the short raceme. Lip bright yellow, equally four-lobed. Sepals and petals purple, equal, recurved at the points.

Wild in Mexico—Loddiges.

Lindl. Bot. Reg. XXXI. 1845. Misc. 60:

Pseudobulbis ovatis ancipilibus subangulatis apice elongatis diphyllis, foliis patulis lineari-lanceolatis racemo paucifloro brevioribus, bracteis minimis, sepalis ovalibus patentissimis, petalis paulo angustioribus obtusis ascendentibus, labelli trilobi plani lacinia intermedia cucinata biloba lateralibus quadratis, tuberculo disci simplici, columna elongata aptera.

This little plant would be a very good *Oncidium*, if it had any wings to the column; it however approaches nearly some of the Columbia species of *Odontoglossa*, with which it will naturally associate. Its raceme is about a foot high, and bears seven or 8 distant flowers of a rich yellow, streaked with dull crimson along the middle of the sepals and petals. The pseudobulbs, which are nearly 2 inches long, are a pale sea green colour. — Exhib. May. 24. 45. by Warner. — Idem in Bot. Reg. 4847. 20. dicitur b. purpuratum. — Lindl. Bot. Reg. l. c. a. sordidum: sepalis petalisque lutescentibus purpureo striatis.

§. Plurituberculata. L. F. p. 37.

* * * This large group, consisting as it does of species, or perhaps forms, exceedingly difficult to distinguish, may be classified in the following manner:

1. *Rostrata*. — A small number have the stigma extended into a long slender beak.

2. *Sarcoptera*. — Others have the column-wings fleshy, and curved downwards, with a somewhat glandular apex. All these agree in having the gland of the pollen hard, horny and furnished with a triangular erect process on each side of the sessile pollen-masses.

3. *Hymenoptera*. — The remainder have neither a rostrate stigma nor fleshy column-wings, and the pollen apparatus is in the usual state. A few have dimorphous flowers — *Heterantha*; in the rest the flowers are all alike — *Homoeantha*; the last again have column-wings nearly or very considerably obsolete — *obsoleta*; in others the column-wings are expanded into a conspicuous membrane — *expansa*.

Undoubtedly this is quite an artificial arrangement, with the exception of the *Rostrata* and *Sarcoptera*: but, in the present state of the genus, with so much more to learn as to the true value of characters, and the exact structure of the flowers of many, no other than an artificial arrangement seems to me to be attainable.

I. Rostrata.

126. ONCIDIUM BOOTHIANUM Rehb. fl. in Bonplandia, Ap. I. 1854. Xenia Orch. ined. Lindl. Fol. 39:
 Panicula long, slender, drooping, narrow. Flowers small. Sepals and petals very blunt. Lip narrow with a long isthmus, and very round flat auricles,
 Wild in Venezuela; province of Carabobo, Cumbre de Valencia, at 5000 ft. —
 Fünck and Schlim, 629; Wägener.

Rehb. fl. Bonpl. II, 14:

Foliis ligulatis pergamenis apice bilobulo attenuatis, panicula densiflora, sepalis cuneato oblongis acutiusculis, tepalis subaequalibus sessilibus, omnibus nunc apice rotundatis, imo retusiusculis, labello elongato angusta basi utrinque rotundato auriculato, apice dilatato transverso obtusangulo, medio emarginato, latitudinem baseos superante, callo baseos puberulo oblongoquadrato depresso, antice depresso bi-

dentato, lateribus serrato, gynostemio basi gracili, alis dolabriformi quadratis, conspicuis, margine externo nunc denticulatis angulo inferiore acuto extenso, tabula infrastigmatica pandurata.

Die Blüten sind hochgelb. Die untern Dreiviertel der Hüllblätter bis auf einen dünnen Saum schön roth; quer über die Mitte der Lippe ein rothes Band, am Grund einige dergleichen Fleckchen; die Grösse ist die derer des *Oncid. lunatum*. Die schmale Lippe erinnert an *O. Wentworthianum* und *O. raniferum*. Carabobo, Wägener.

127. *ONCIDIUM WEDDELLI* Lindl. Fol. 39:

O. panicula ramosissima heterantha ramulis flexuosis intricatis, sepalis petalisque linearibovatis secundis, labello basi acute rhombeo antice elongato in lobum med. reniformem emarginatum expanso, crista tomentosa quinque-loba dentibus 8 liberis acutis circumstantibus, columna tereti tomentosa alis bipartitis linearibus buccis horizontalibus oblatiis.

A most curious plant with the habit of *O. pyramidale*. Flowers equally small. Column terete, with a pair of horizontal oval cheeks, and column-wings each divided to the base into two linear lobes, of which the two upper arch over the anther.

Wild in Bolivia; in the valleys of Tipani and Apolobamba, in the province of Larecaja and Caupolican, among grass—Weddell.

128. *ONCIDIUM SCHLIMII* Linden, Lindl. in Paxton's Fl. Garden, no. 444. L. F. 39:

Owing to some confusion in my references to Linden's numbers, no one has been able to identify this well-marked plant. The panicle is widely spreading, loose, and compound. Flowers bright yellow, spotted with brown. Its twolobed column-wings, with the lobes divaricating and tapering to fine points, and the rostrate stigma mark it well. In *O. tigratum* the two-lobed column-wings are truncate or even emarginate.

Wild in New-Granada; in the province of Ocanna, at the height of 3—4000 ft. — Schlim, 1012.

Lindl. Paxt. Fl. Germ. II. 118:

Foliis binis rectis ensiformibus, scapo subscandente racemoso paniculato racemis flexuosis, labello bilobo rotundato basi angustiore auriculato cristae tuberculis quaternis, columnae alis triangularibus, utrinque acuminatissimis.

Scape 5' long. (Funck and Schlim 7. Oct. 46.) Merida 7000'. Pseudobulbs narrow. Panicle wavy, weak, inclined to scramble and bears short racemes or imperfect panicles. Flowers smaller than in *O. reflexum* near which the species will stand. Bright yellow slightly and irregularly barred with brown.

129. *ONCIDIUM TIGRATUM* Rehb. fl. in Bonpl., May I. 1845. Lindl. Fol. 40:

Flowers deep-yellow, with dark crimson blotches. Column-wings so deeply two-lobed, as to be bluntly lunate. Differs from Weddelli in the lobes of the column-wings being broader, the column smooth, not downy. I have only seen a single flower and a sketch.

Wild in Peru-Warczewicz.

Rehb. fl. Wrsewz. Bonpl. II. 109:

Nulli affine, labelli portione postica rhombea in anticam reniformem sinuatam per unguem brevem transeunte, callo varicoso in basi, prae-positis carinulis ternis, alis assurgentibus sinuato excisis, hinc erecto bifidis.

Paniculae rami ramulosi fractillexi, bractee linearitriangulae ovariis pedicellatis multoties breviores, flores illis *Oncidii carthagenensis* aequimagni ejusdemque substantiae in sicco subchartacei; sepalum dorsale oblongocuneatum apiculatum, lateralia unguiculata cuneata oblonga subapiculata paulo longiora, tepala a cuneata basi flabellata, apice retusiusculo rotundata nunc cum apiculo, sepalis duplo latiora, la-

belli portio posterior transverso rhombea utrinque acuta, medio antice producta in unguem angustum portionis anticae paulo latioris cordato reniformis apice exciso sinuatae, sinus interjecti angusti obliqui; callus varicosus in basi, praepositae 3 carinae subtriangulae, addita utrinque falcula subaequali, regio antecarinalis velutina; gynostemium recurvatum, basi tenui, supra clavatum, rostellum breve ornithorrhynchum deflexum, alae assurgentes excisura sinuata ad medium bifidae, laciniae ligulatae breves, superior hinc crenulata; tabula infrastigmatica utroque medio margine sinuata. Blüten scheinen hochgelb; Hüllblätter und Lippengrund dunkelcarmoisin gefleckt und bandirt. Diese Art steht durch die Gestalt der Säulenflügel allen bisher beschriebenen Arten dieser Gruppe fern. Auf den ersten Blick glaubten wir, *Oncidium retusum* vor uns zu sehen, welches in den meisten wichtigen Punkten völlig verschieden ist. v. Warscewicz.

Huc: *Oncidium leopardinum* Lindl. Fol. p. 28. sub Nr. 93:

Panicula laxa diffusa flexuosa, petalis ovalis obtusis apiculatis subunguiculatis, labelli auriculati lobo medio unguiculato transverso emarginato, crista antice 5 carinata carinis lateralibus anticis longioribus falcatis postice sinuosa dentibus confluentibus duplici serie circumdata, cum alis maximis cordatis sublobatis retrorsum falcatis.

Apparently a plant with a loose straggling panicle. Flowers the size of those of *O. pyramidale*, or smaller, with very dark distinct bands on the sepals and petals, and at the base of the lip. The crest consists at the base of a lobed sinuous centre surrounded by a double line of half confluent teeth, in front of five teeth, of which the two basal are short, the central twice as long as they, and the two in front still longer and curving outwards.

Wild in Peru; sources of the Marannon-Warscewicz.

II. („Sarcoptera“ Lindl. l. c.) *Miltoniastrum* Rchb. fil.

130. ONCIDIUM CARTHAGINENSE Swz. act. Holm. 1800, p. 240. LO. 201. Lindl. F. 40:

(A) *Swartzii*. Flowers whitish, variegated with ferruginous and purple. Petals paler.

O. carthaginense Swz. fl. ind. occ. 1479.

E. carthaginense Jacq. Amer. 228, t. 133, fig. 4.

(B) *Oerstedii*. Flowers pure white, variegated with various shades of rose.

O. Oerstedii Rchb. in Bonpl., Ap. I. 1854.

(C) *sanguineum*. Flowers smaller than usual, pale yellow, with bright irregular crimson spots.

O. sanguineum Lindl. Sert. Orch. t. 27.

O. Huntianum Bot. Mag. t. 3806.

O. roseum Lodd. Cat., ed. 2, nb. 1318.

O. luridum Henchmanni Km. et West. Fl. Cab. t. 97.

O. Henchmanni Lodd. Cat., ed. 2, no. 1323.

O. panduriferum HBK., I. 346, t. 82. LO. 203.

(D) *Klotzschii*. Flowers larger than the last, dirty white, marked with round spots of deep rose.

O. Carthaginense Lk. Klotzsch et Otto. Ic. t. 6.

I return to my original view of the distinctness of this and *O. luridum*, which never has the dorsal sepal arched over the column with a longer unguis than others, nor the base of its lip nearly as broad as the middle lobe, to say nothing of minor distinctions. Prof. Rchb. was led by an inaccurate drawing into proposing *O. Oerstedii*, as I was by the same cause in the case of *O. sanguineum*, whose crest is most incorrectly given in the „Sertum“; it in reality consists of the usual five tubercles, of which one central and two in front are plump and even, white, the two in the rear are shrivelled and sinuous. Similar negligence has been shown by the artist who prepared the plate for Link, Klotzsch, and Otto's „Icones“, the crest of

which bears no resemblance to truth. With regard to this *O. sanguineum*, there is no doubt that the *O. Huntianum* of the „B. M.“ and it are identical. Sir Wm. Hooker was misled by the assurance from Woburn, that the plant sent him from that place was Brazilian, not the only misrepresentation which has found its way into public out of that establishment.

O. obsoletum, an unpublished? name of Galeotti's, evidently belongs to some variety of this, as I learn from Prof. Rehb. To the same acute observer is due the discovery, that *O. panduriferum* is nothing more than some common form of *O. carthaginense*; probably of var. *sanguineum*, judging from a flower with which he has favoured me.

Wild in Tropical America; A. Jamaica, on trunks and large branches of trees—Swartz; thick forests of Carthagenæ—Jacquin; B. Nicaragua—Oersted; C. La Guayra—Loddiges; Santa Martha—Purdie, in hb. Hooker; D. Caraccas—Wagener.

ad C. *Oncidium sanguineum* Lindl. Bot. Reg. XXV. (1839.) Misc. 18:

Ebulbe, foliis oblongis coriaceis dorso carinalis, scapo longissimo paniculato, sepalis subrotundis unguiculatis lateralibus basi connatis petalisque crispis sublobatis, labelli trilobi subcrispi vernicati lobis subæqualibus intermedio retuso cuneato, crista ovata convexa corrugata, columnæ alis rotundatis sublobatis, anthera puberula.

Habit of *Oncidium carthaginense*, but with straw-coloured flowers stained with crimson blotches. La Guayra. Loddiges imp.

Lindl. Paxt. I. p. 21: the two posterior tubercles are more oblong, projecting with a furrow in the middle. In all varieties of *Oncid. carthaginense* there is a pair of strong warts in place of the small teeth one on each side of the anterior elevation, and the like body is divided into two distinct V. — Hook. Lond. Journ. III. 508. (1814.) Kingston, on Logwood hedges. Purdie. — Rehb. fl. Bonpl. II. 13: Caracas 2000'. Wagener.

Huc: *Oncidium Huntianum* Hook. Bot. Mag. 3506:

Pseudobulbo conico, folio solitario, oblongo, coriaceo, crasso acutiusculo, basi attenuato, sessili: scapo longissimo, racemo composito, elongato; pedicellis bi- — trifloris; petalis sepalisque patentibus, oblongo-ovatis; crispatis; labello trilobo basi supra sub 5-tuberculato, lobis lateralibus crassis acutiusculis, intermedio sublabelliformi longiore medio emarginato, columna bialata.

Brazil. Woburn 39 (10.) — Perigonium flaveolum, rubro adpersum, labii basi flava.

131. *ONCIDIUM GUTTATUM* Rehb. fl. (LURIDUM Lindl. in Bot. R. t. 727). Lindl. Fol. 41:

(A) *olivaceum*. Flowers olive-green, with dusky brown blotches. Botan. Magazin. 1839, t. 16.

(B) *guttatum*. Flowers dull yellow, spotted with cinnamon-brown. Bot. Register 1839, t. 16.

Ep. guttatum Linn. sp. pl. 1351.

Cymbidium guttatum Willd. 4. 102.

O. Boydii Hort.

O. cuneatum Lindl. Coll. Bot. sub t. 27.

(C) *atratum*. Flowers dull olive, with a very dark brown whole-coloured lip, Hort. Soc. Journ., VI, c. ic. xyl.

O. Lindeni Lodd. Cat.

(D) *intermedium*. Flowers dull yellow, marked with circular brown spots. Panicle stiff, narrow, with rigid flexuose branches.

O. intermedium Knowles and Westcott Fl. Cab. t. 60, bad.

(E) *Morreni*. Flowers pale rose-colour, spotted with crimson and tipped with yellow. Lip cinnamon-brown.

O. cosymbephorum Morren, Ann. Gand. t. 275.

Many more varieties might be enumerated, were it desirable— for this is evidently a most variable plant, constant however in the form and proportion of its parts, the column and column-wings, and also in the crest, with the exception that in D, which may be a distinct species, an additional tubercle or two appears on the outside of the others.

Wild in Tropical America; A. Martinique—Sieber; Trinidad—Hooker; Mexico—Schiede (Rehb.); B. Jamaica—Hort.; C. Mexico, near Tampico—Hartweg; D. Santiago in Cuba, on the Sierra Maestre, at the height of 5000 ft.—Linden.

Ad C: *Oncidium Lindeni* Lodd. Cat. ed. 2. 1326. Sert. sub 48:

Habit of a small *O. carthaginense*. Labellum intense black chocolate; the flowers appear in a simple zigzag spike, which continues to grow after the flowers have fallen off. I did not see it in flower. —

Lindl. Paxt. I. 185. N. 238. Journ. Hort. Soc. VI: *Oncidium luridum atratum* Lindl. Mexico. Rich crimson flowers. Whether or not *O. luridum* is really a mere variety of the Carthag. Oncid., becomes more and more doubtful as our knowledge of such plants extends. In the present instance it is unnecessary to open that question, the plant now mentioned being undoubtedly a very fine form of the *O. lurid.*, whatever the relation of the latter to the Carthaginen. *O.* may finally prove to be. With the habit of the common form of the species this combines flowers smaller than usual, very flat, with olive and rose coloured sepals and petals, and a rich crimson lip furnished at the base with 5 purple black tubercles, 4 of which surround the fifth of these tubercles; the central and two anterior are oblong and simple, the two posterior are concave, or almost kidney-shaped, with the concavity backwards. The wings of column are oblong, truncated fleshy bodies attached by the narrower end. It is a fine var., in some resp. like the purple *O. haematochilum*.

Ad D: *Oncidium intermedium* Knowl. Westc. Flor. Cab. II. (1838). 60:

Foliis oblongis acutis rigidis carnosis, scapo flexuoso paniculato ramoso multifloro, sepalis undulatis unguiculatis subintegris, supremo rotundato subcochleato, lateralibus spathulatis subreflexis, petalis late unguiculatis subrotundatis crenulato-crispis, labelli lobis lateralibus nanis revolutis intermedio reniformi undulato emarginato, crista postice lobis 2 crassis tuberculatis, antice callis 3 intermedio elevato elongato lateralibus divergentibus, columnae alis carnosis obliquis supra margine repando-sinuato infra auricula elongata.

Oncidium sanguineum Lindl. Var. *auriculatum* Rgl. Ind. Sem. Petr. 55. (*Oncid. ornatum roseum* et *obsoletum roseum* H. Petropol.): Sepalis petalisque luteis roseo-maculatis, labello luteo-albo, columna alba lobis auriculaeformibus. Cetera ut genuini.

Lindl. Paxt. Fl. Germ. I. p. 21: „there is quite a bunch of tubercles at the base of the lip.“

132. ONCIDIUM HAEMATOCHEILUM Lindl. in Paxt. Fl. Gard, t. 6. Lindl. Fol. 41:

Intermediate as it were between *O. Lanceanum* and *luridum*. Sepals and petals green mottled with crimson. Lip crimson mottled with white. Pollenmasses and appendages those of *O. luridum*.

Wild in New-Granada—Loddiges.

Lindl. l. c. p. 21:

Ebulbe foliis oblongis planis, coriaceis, acutis, maculatis, solitariis, racemis densis rigidis, sepalis liberis petalisque conformibus spathulatis undulatis, labello subrotundo basi auriculato, crista basi obsoleta antice flexuosa (litteram W. referente) inde in jugum producta denticulo utrinque; columnae alis rotundatis decurvis sublobatis.

In all varieties of *Oncidium carthaginense* is a pair of strong warts in place of the small teeth, one on each side of the anterior elevation and the W like body is divided into two distinct V's.

133. *ONCIDIUM LANCEANUM* Lindl. in Hort. Trans. n. s. II. 100, t. 7. Bot. Reg. t. 1887. Lindl. Fol. 41:

This beautiful plant seems confined to Surinam. Its sepals and petals are greenish richly mottled with brown; its lip rose-colour, deep violet on the lower half. The flowers are fragrant, like Vanilla, and vary in the depth of colour; but this seems to depend on cultivation only.

Wild in Surinam—Lance, Regel 1786, Hostmann 342.

Lindl. in Hort. Trans. l. c.:

Ebulbe, foliis oblongis acutis planis substriatis carnosis, scapo racemoso composito erecto rigido racemulis confertifloris, sepalis petalisque conformibus oblongis obtusis carnosis concavis margine undulatis, labelli lobo medio dilatato subcuneato integerrimo basi hastato, lobis lateralibus semiovatis, crista triloba carnosia jugoque elevato proclivi, columnae alis carnosis rotundatis, anthera cristata.

Floral. Cab. II. Nr. 791 In Tamarindo, Sapodilla, Calabash trees. —

134. *ONCIDIUM CAVENDISHIANUM* Bateman Orch. Mex. t. 3. Lindl. Fol. 42:

O. pachyphyllum Hook. Bot. Mag. t. 3807.

Flowers large yellow, in a stiff panicle, with a tinge of green on the sepals and petals. Base of lip much wider than the middle lobe. *O. pachyphyllum* has some crimson spots on the sepals and petals.

Wild in Guatemala—Skinner.

Bat. l. c. (1837):

Foliis erectis carnosis late lanceolatis acutis scapo elato triplo brevioribus, sepalis obovatis obtusis, supremo fornicato, petalis subaequalibus oblongis obtusis, valde undulatis; labello magno trilobo, laciniis lateralibus rotundis petalis subconformibus intermedia majore reniformi profunde emarginata, cristae tuberculis 2 ad basin, 2 a fundo lamellae elevatae rotundatae sitis; columna brevi crassa auricula decurva versus apicem utrinque aucta.

Sepals greenish yellow spotted with bright chestnut. Lip of a pure yellow. Guatemala. Skinner.

Lindl. Sert. sub 48:

Ebulbe, foliis carnosis strictis acutis basi complicatis, scapo paniculato brevioribus, sepalis obovatis obtusis supremo fornicato, petalis subaequalibus oblongis obtusis valde undulatis, labelli trilobi laciniis lateralibus unguiculatis rotundatis intermedia majore reniformi profunde emarginata, cristae tuberculis 2 ad basin, 2 a fronte lamellae elevatae rotundatae sitis, columnae alis linearibus decurvis inflexis.

Guatemala. — A most noble species, panicles of large flowers, having greenish sepals and petals and a bright clear yellow lip.

Van Houtte Fl. Serres IV. 330: dicit analysin in Bot. Mag. 2807. minus esse correctam, quam figuras plantae delineatae ipsius.

Huc judice Lindl.: *Oncidium pachyphyllum* Hook l. c.:

Pseudobulbo nullo, folio elliptico oblongo apice recurvo acuto crassissimo, panicula ampla, sepalis late obovato spatulatis undulatis liberis, petalis similibus sed paulo angustioribus, labello tripartito, disco basi tuberculis 4 cruciatim dispositis, quinto in medio, laciniis lateralibus obovatis intermedia transversim oblonga emarginata, columna utrinque ala oblonga deflexa.

Mexico, Woburn Collection. Parkinson.

Perigonium flavum, rubro adpersum.

Bot. Reg. XXVI. 1840. Misc. 138. *Oncid. pachyphyllum* is the same as the *Oncid. Cavendishianum*, Bat. Orch. of Mex. and Guat. t. 3.

Obs. Hæc sensu Lindleyano. Quæstio perdifficilis. In Xenii Orchidaceis I. explicavi (et suadente amic. Wendland fil.) et distinxî utrumque. Rehb. fl.

135. *ONCIDIUM BICALLOSUM* Lindl. in Benth. Pl. Hartw. p. 94. B. R. 1843, t. 12. B. M. t. 4148. Lindl. Fol. 42:

Much like the last; but the basal lobes of the lip are very much smaller, the flowers are always larger, and they usually (always?) grow in a raceme instead of a panicle. Sir W. Hooker suggests that it may be a variety: but the differences indicated seem constant.

Wild in Guatemala—Hartweg.

Lindl. Pl. Hartw. Fasc. 2. p. 94. 1842:

Bracteis ovatis membranaceis obtusis, sepalis liberis obovatis concavis, petalis oblongis obtusis, labelli lobis lateralibus abbreviatis, intermedio maximo transverso emarginato subcordato, crista bicallosa, tuberculis distantibus uno ante alterum posito rugosis subtrilobis, columnæ auriculis linearibus falcatis recurvis.

Ramulum inflorescentiæ tantum vidi. Secundum cl. Hartwegium faciem induit *O. Cavendishiani*, omnino tamen diversum. Crista labelli bituberculata, nec non lobis lateralibus parvis facile distincta. Lindl. Hacienda de Diegera. Mexico. Hartweg.

Lindl. Bot. Reg. XXVIII. (1842). Misc. 14:

Has much the habit of *O. Cavendishianum* so that it seems a mere variety of it. Flowers 2" diam. appear in a dwarf erect raceme, not panicle; they are of a rich yellow, with the sepals and petals bordered with cinnamon colour; the labellum has two very small lateral lobes, and for its crest it has two distinct tubercles, the posterior double, the anterior trilobed, and the two separated by a considerable space. The flowers are slightly scented, which is not the case with *O. Cavendishianum*.

Bot. Reg. XXIX. (1843). tab. 12. — Hook. Bot. Mag. (1845.) 4148: Dr. Lindley alludes to its close affinity with *Oncidium Cavendishianum*, so much to seem a mere variety of it, but it is in reality quite distinct. My own investigations would rather lead me to consider the two as forms of one and the same kind, and that the species is liable to considerable variation the more especially as our *Oncid. pachyphyllum* Bot. Mag. 3807 is considered by Dr. Lindley a state of *O. Cavendishii*. To me our present plant seems to correspond better with Mr. Batemans original figure of *O. Cavendishii*, than our *O. pachyphyllum* does.

III. Hymenoptera. A. Heterantha. L. F. p. 42.

136. *ONCIDIUM PENTADACTYLON* Lindl. in Ann. Nat. Hist., XV. 383. Lindl. Fol. 42:

Flowers small, in a long narrow many-flowered panicle, fragrant (Purdie), apparently gaily blotched with brown on yellow.

Wild in Peru; Quito—herb. Hooker; village of Tambillo—Hartweg, Jamieson, in hb. Hooker; Caraccas, Paramo of Ruiz—Purdie.

Lindl. l. c. 1845:

Pseudobulbis ovatis compressis diphyllis, foliis lanceolatis tenuibus, scapo longissimo paniculato multo brevioribus, floribus plurimis abortientibus, sepalis lineari-lanceolatis liberis, petalis lanceolatis, labello oblongo emarginato, pandurato lobis basilaribus intermedio subaequalibus, crista verrucosa processibus 5 digitiformibus circumdata, columnæ alis maximis obtuse lobatis.

Quito. (Hartweg.)

This is near *O. Wentworthianum* in the colour and structure of the flowers. Occasionally the principal part of the abortive as in *O. heteranthum*. The panicle is occasionally 3 feet long or even more.

137. *ONCIDIUM CULTRATUM* Lindl. in Ann. Nat. Hist., XV. 384. Lindl. Fol. 42:

A small species, about six inches high, with a stiff curving slightly paniced raceme.

Wild in Popayan; in woods on the ascent to Sotara—Hartweg.

Lindl. l. c. 1845:

Pseudobulbis ovalibus compressis, foliis lanceolatis solitariis basi canaliculatis, scapo humili aequalibus, panicula cernua simplici floribus quibusdam abortientibus, sepalis petalisque oblongis subaequalibus reflexis, labello bilobo, crista parva tuberculata, columnae alis maximis cultratis obtusis integris.

Popayan. (Hartweg).

As far as I can judge of *O. olivaceum* which I have never been able to see, it must be near this, which is a dwarf species with not more than 10 flowers in the panicle. The flowers appear to be olive brown with a yellow lip.

138. *ONCIDIUM RETUSUM* Lindl. in Bot. Reg. sub t. 1920. Paxt. Fl. G., II. ic. 136. Lindl. Fol. 42:

Perhaps the rarest of its race. Flowers marked with intensely brown bands nearly up to the edge.

Wild in Peru; M. Pariahuanca—Mathews, 1066.

Lindl. l. c. 1837:

Pseudobulbis —, foliis lineari-lanceolatis, scapo paniculato divaricato, sepalis petalisque subaequalibus spathulatis retusis subcarnosis, labelli lobo medio reniformi bilobo lateralibus paulo majore, cristae lamellis 5 brevibus tuberculos 6 elongatos circumdantibus, columnae alis maximis acinaciformibus dentatis.

A beautiful species with deep chestnut and yellow flowers, and a yellow lip. Its mode of growth is that of *O. Baueri*.

B. *Homoeantha*: * *obsoleta*. L. F.p. 42.

139. *ONCIDIUM BRACTEATUM* Rehb. fl. in Bot. Zeit. 1852, p. 695. Lindl. Fol. 42:

A few flowers from Prof. Rehb. do not enable me to examine this satisfactorily. Its scabrous peduncles and great spathaceous bracts are remarkable. „The end of the inflorescence is terminated by convolute bracts.“ — Rehb. in lit.

Wild in Veragua; Chiriqui, on trees, at 6–9000 ft. — Wagener.

Rehb. fl. l. c.: *O. bracteatum* Wswz. Rehb. fl.:

Pedunculo muriculis obtusatis stomatophoris asperulo, ramulis in axillis spatharum glumacearum acutarum, bracteis subaequalibus ovaria pedicellata subaequantibus, perigonii phyllis oblongis acutis prope aequalibus, lateralibus internis quidem latioribus, labello trilobo, lobis lateralibus auriculaeformibus, obtusatis, lobo medio ab illorum basi sensim angustato, subito in laminam reniformem bilobam dilatato, callo baseos angusto dorso carinato, antice tricrenato, lateribus paucidentato, alis gynostemii angustis, minute denticulatis, lamellis corneis quadratis parvulis suppositis inferne rectangulo flexis confluentibus.

Die obersten 2–3 Scheiden tragen keine Zweiglein und bilden einen geschlossenen Schopf, etwa wie die untersten sterilen Bracteen gewisser Coelogyne. Blüthe sehr gross, wie die des *Oncid. Wentworthianum*. Der Anhangsapparat unter der Narbe

ein kleiner, oben offener Kasten ohne Deckel ist eine wunderliche Neuigkeit. Chiriqui Cordilleren 6—9000' auf Bäumen. October. v. Warszewicz.

140. *ONCIDIUM FASCIFERUM* Rehb. fl. in Bonpl., May I. 1854. Lindl. Fol. 42:

A tall branching wide panicle, with acuminate spathaceous bracts half as long as the peduncle, and an extremely short column, with small circular wings and cartilaginous cheeks of the same form, and not much larger, are characteristic of this well-marked plant. The crest consists of a broad blunt carina, on each side of which stands a pair of notched teeth, one a little in front of the other. I have a fine specimen from Warszewicz.

Wild in Peru; at the sources of the Marañon—Warszewicz.

Rehb. fl. Wrszew. Bonpl. II. 109:

Aff. pentadactylo floribus monomorphis, labello basi duplo angustiori, quam apice, calli systemate quinqueseriato; mediano interjecto lineari.

Panicula elongata brachyclada, ramuli distantes, infimi 4—8 flori, bractee triangulae ovaria pedicellata quinta fere parte aequantes, sepala linearilanceolata acuta basi bene cuneata, tepala a basi anguste brevissimeque cuneata statim dilatata oblonga acuta sepalis duplo latiora, labellum panduratum, basi utrinque acutangulum, angustum, antrorsum sensim angustatum, ab hoc ungue subito dilatatum in laminam reniformem apice medio triangulo insiliente excisam, callus quinqueseriat: carina media abbreviata; adjectae ter binae carinulae: anticae lineares, reliquae 4 obtusangulae; extremae utrinque 2 lineariligulatae breves; gynostemii postice dorso summo apiculati fovea cordiformis; alae angustae, longae, dolabriformes, angulo superiori acutae, inferiore obtusae; tabula infrastigmatica apice utrinque valde angulata. Nächst *O. pentadactylon* Lindl. ! Es fehlen aber die abortirten Blüten, die Zweige der Rispe sind bei dieser Art gross und verzweigt; die Säulenfügel breiter, die Lippe am Grunde eben so breit, als vorn (hier schmaler); endlich die Buckel verschieden. Die Blüten beider Arten sind gleich gross, Hüllblätter und Lippengrund bei dieser sehr schön rothbraun gefleckt. Peru. v. Warszewicz.

141. *ONCIDIUM PLANILABRE* Lindl. in Journ. Hort. Soc., VI. 59, c. ic. xyl. L. F. 43:

Flowers dull olive-brown, except the lip, which is clear yellow, and cinnamon coloured at the base. The singular rhomboidal denticulate crest with the anterior angle produced and resting upon a pair of unequal teeth on either side is very peculiar.

Wild in Brazil; locality unknown.

Lindl. Journ. II. S. VI. 59. Paxt. Fl. G. I. 170, Nr. 220:

Pseudobulbis ancipitibus tenuibus costatis, foliis ensatis racemo brevioribus, racemo simplici, sepalis petalisque lanceolatis unguiculatis undulatis subaequalibus, labelli laciniis lateralibus oblongis parvis, intermedia semicirculari plana emarginata, crista rhomboidea cuspidata margine crassa verrucis 2 inaequalibus utrinque versus cuspidem, dente forti obtuso faciei columnae adnato, columnae brevibus carnosissimis inflexis.

Much like *O. Suttoni*. Sepals and petals rhomboid lanceolate, acuminate, wavy.

Crest consists of a broad lozengeshaped rugged edged cuspidate process, beneath which, near the point, on either side, are 2 small unequal tubercles; in addition to which there is a stout blunt tooth which rises in front of the column, forming part of it. The wings of the column are roundish, dwarf, incurved.

142. *ONCIDIUM TIPULOIDES* Rehb. fl. in Bot. Zeit. 1852, p. 856. Lindl. Fol. 43:

Sepals lanceolate, wavy, narrower than the oblong acute unguiculate petals. Lip hastate, very narrow at the base, tapering into a long narrow unguis expanding into a bluntly crescent-shaped emarginate middle lobe. Crest small, consisting of a horse-shoe ridge, whose convexity is extended into a keel, with a small wart at the base

on either side. Flowers yellow, very narrow, with a few reddish-brown flecks. From a sketch communicated by Rehb. and his description.

Wild in Peru; Cuchero—Pöppig.

Rehb. fl. l. c.:

(Foliis oblongis basi petiolatim attenuatis, acutis), panicula laxa, diffusa multiflora, ramis haud elongatis, bracteis triangulis apice subulatis abbreviatis, perigonii phyllis unguiculatis dein oblongis acutiusculis repandulis, labello brevissimo unguiculato cuneato, basi utrinque anguste angulato, humerato, dein lineari, apice in laminam reniformem postice utrinque valde angustatam antice medio emarginatam dilatato, carina interposita in basi postice in lineam transversam lunulatam expansa, addito lobulo obtuso, utrinque in margine, gynostemio incurvo aptero, tabula infrastigmatica prominula, utroque margine quadrata, retusa, medio canaliculata, androclinio postice apiculato, rostello ornithorrhyncho, deflexo, brevi. —

Ob die Blätter mit dazu gehören, kann ich nicht verbürgen, da sie lose liegen. Blüten gelb mit [wenig rothbraunen Flecken;] sehr schmal und auffallend lang. Cuchero in Peru. Pöppig.

143. ONCIDIUM CITRINUM Lindl. in Bot. Reg. t. 1758. Lindl. Fol. 43:

Flowers bright yellow, with a few dull clouds on the sepals and petals. This must be near *tipuloides*, which I have not seen. The cheeks of the column are more conspicuous, than in any of the succeeding of this section.

Wild in Trinidad—Loddiges.

Lindl. l. c. (1836):

Pseudobulbis oblongis compressis, foliis ensiformibus rigidis scapo simplici brevioribus, sepalis petalisque labelli longitudine lineari oblongis undulatis, labello cordato utrinque introrsum arcuato apice dilatato subreniformi, crista 8 tuberculata pubescente, alis minimis, stigmatibus orbiculari.

Planta O. altissimo (fol. 1651), igitur *Baueri* valde affinis et forte mera varietas. Diversa tamen videtur scapo non ramoso, floribus parum maculatis, sepalis petalisque minus acuminatis, crista tuberculata potius quam digitata, demum alis minimis et stigmatibus orbiculari nec angusto compressoque. Trinidad.

144. ONCIDIUM PICTURATUM Rehb. fl. in Bonpl., Ap. I. 1854. L. F. 43:

Extremely like *O. citrinum*, except that the flowers have olive-green sepals and petals, spotted like those of *O. leucochilum*. This and the last require to be compared in a living state.

Wild in the Caraccas—Warczewicz.

Rehb. fl. in Bonpl. II. 13:

Panicula racemosa, bracteis scariosis spathaceis, ovarii pedicellati tertiam seu quartam adaequantibus, perigonii phyllis oblongis acutis undulatis, labello pandurato, basi angusto, lobis basilaribus obtusangulis postice humeratis, sensim antrorsum angustato, lobo medio lato reniformi, apice bilobo, sinu interjecto parvo, callo baseos utrinque tridentato, gynostemio incurvo, alis retusis, anguste quadratis, denticulatis, basi acutangulis, tabulae infrastigmaticae limbo obtusangulo.

Eine höchst ausgezeichnete Art. Blüten so gross wie die eines grossen *O. leucochilum*. Die Hüllblätter sind olivengrün, mit schönem Schwarzroth überwiegend reich und gross gefleckt, die untere Hälfte der vorn hochgelben Lippe ist braunroth. *Oncid. sphacclatum* Lindl. und Consorten sind die nächsten Verwandten. Die fast ellenlange Aehre, welche unten durch kurze, höchstens dreiblühige Zweiglein ris-

pig wird, die Farbe, die Lippenschwiele und die Ecken unter der Narbe zeichnen sie hinlänglich aus. Caracas. Wagener

145. *ONCIDIUM PARDALIS* Rehb. fl. in Bonpl., Ap. I. 1851. Xenia ined. L, F. 43:

Apparently a small species with the habit of *O. cardiostigma*. Scape fewflowered racemose. Sepals and petals exactly alike, lanceolate. Lip nearly as broad at the point as the base, denticulate at the incurved sides. Column slender and without projecting cheeks; wings merely two inconspicuous membranous teeth. Flowers yellow with blue! (blauen) flecks. I have a figure from Prof. Rehb.

Wild in La Guayra—Wagener.

Rehb. fl. l. c. II. 13:

Pedunculo gracili spithamaeo, basi multivaginato, apice flexuoso, racemoso, bracteis ovariis elongatis multo brevioribus, sepalis tepalisque unguiculatis lanceolatis acutis undulatis, labello panduraeformi, basi angustiore, medio paulo constricto, callo basilari depresso, postice transverse gyroso, utrinque bidentato, medio carinato, gynostemio incurvo, stigmatate abbreviato utrinque pone basin minute unilobulato (alarum loco), tabula infrastigmatica elongata, utroque margine marginata.

La Guayra. Blüten so gross, wie bei vorigem, gelb mit blauen Fleckchen auf Perigon und Lippengrund; die Spitzen der Perigonialblätter sind ungefleckt.

Caracas Wagener.

146. *ONCIDIUM CARDIOSTIGMA* Rehb. fl. in Bonpl., Ap. I. 1854. Lindl. Fol. 43:

Seen in cultivation with Booth and Sons, of Hamburg. Pseudobulb slender, narrow, two-edged, furrowed. Leaf about four inches long, narrow, complicate, oblique at the point. Scape shorter than the leaf, three or four flowered. Flowers small, with brown sepals and petals, the last of which are the widest; lip yellow, brown at the base. Column with two small auricles on each side, instead of column-wings.

Wild?; said to come from Mexico.

Rehb. fl. in Bonpl. II. p. 91:

Ab omnibus recedit lobulis quadrigeminis alarum loco et callo depressis quadrato apice et basi bilobulato, lobulo quinto antice superposito.

Pseudobulbus gracilis oblongus angustius anceps, utrinque bicostatus. Folia ligulata, apice valde inaequali biloba. — Bractea scariosae acutae ovarii pedicellati quintam aequantes. Sepala oblonga obtusiuscula, tepala prope duplo latiora. Labello a basi brevissime unguiculata postice utrinque angulatum, latiusculum, dein subangustatum, medio in laminam reniformem, alte bilobam expansum, lobo altero in alterum imbricato. Callus baseos quadratus, postice utroque latere unituberculatus, apice in tres lobulos rotundatos expansus, medio superposito. Gynostemium gracile, fovea stigmatica rhombea basi retusa, auriculae 2 acutae minutae utrinque pone apicem et basin foveae sibi superpositae, tabula infrastigmatica nullo pacto producta.

147. *ONCIDIUM TETROTIS* Rehb. fl. in Bonpl., May I. 1853. Lindl. Fol. 44:

Panicle long, with short branches. Flowers as large as in *O. Baueri*. Sepals and petals brown. Lip yellow. Crest horse-shoe-shaped at the base, with the convexity next the column; in the curve lies a papillose convexity, and in front of all are about four small warts. Two very minute rudiments placed one above the other on either side of the stigma represent the column-wings. From a sketch by Rehb. and his description.

Wild in New-Granada—Warczewicz.

Rehb. fl. Warszewicz l. c. II. 109:

Aff. *O. citrino* labello antice valde dilatato, angulis posticis prope

divaricatis, non retrorsis, callo postico semilunato, antico quadrato, praepositis papulis 2—3, alarum loco utrinque lacinulae 2 superpositae minutae.

Panicula elongata, ramuli abbreviati, flexuosi, pauciflori, bracteae spathaceae acutae, ovariis pedicellatis filiformibus quater breviores, sepalia ac tepala a basi cuneata lanceolata acuta undulata, labellum basi utrinque ligulate obtuseque auriculatum, auriculis retrorsis, dein subito attenuatum in cuneum elongatum pro portione antica quam basis duplo latiore reniformi apice bilobo cum denticulo interjecto in sinu, callus posticus transversus semilunatus, anterior quadratus, pustulatus, antepositae papulae 2—3, regiones proximae subvelutinae, gynostemium gracile, apice incurvum, utrinque pone foveam bis alatum: alae = lacinulae parvae obtuse triangulae sibi invicem impositae, raro confluentes, foveae limbus superior (rostellum) tridentatus, denticulus utrinque lateralis, medius linearis, retusus, deflexus; tabula infrastigmatica producta. Blüten so gross, wie die des *O. Baueri* Lindl. Hüllblätter braun, Lippe gelb. Neu-Granada v. Warszewicz. — Die Gestalt der Lippe bedingt eine nahe Verwandtschaft mit *Oncidium citrinum*: es stehen aber die hintern Oehrchen der Lippe nicht so stark nach hinten und der Mittellappen ist bei dieser Art schmaler; der Buckel derselben ist fast nach dem Plane dessen des *Odontoglossum pulchellum* geordnet; die Hüllblätter sind breiter und die Säulenhöhren einfach und fast dreieckig.

148. *ONCIDIUM LENTIGINOSUM* Rehb. fl. in Bonpl., Ap. I. 1854. Xenia ined. Lindl. Fol. 44:

Pseudobulbs small, furrowed. Panicle is described as ample, with fewflowered divaricating branches. The specimen before me is a slender lateral, with the flowers one inch and a half, and the branchlets two inches apart. The flowers are thin, delicate, as large as in *altissimum*, clear yellow, with minute brown freckles on the sepals and at the base of the lip. The crest consists of five very small carinulae 2 with a rudimentary tooth or two in addition. In German gardens.

Wild in the Caraccas—Wagener.

Rehb. fl. in Bonpl. II. 13:

Pseudobulbis oblongis sulcatis, foliis —, paniculae amplae ramis divaricatis, paucifloris, bracteis scariosis ovalis acutis pedicellis ovarii vix quartam aequantibus, sepalis oblongis cuneatis acutis, tepalis subaequalibus obtuse acutis, labello pandurato basi utrinque obtusangulo angusto, medio sensim constricto, apice magis dilatato, utrinque obtuse truncato, antice bilobo, callo baseos elongato, basi et apice utrinque curvidentato, dorso carinato, denticulis medio lateri utrinque 1—2 additis, gynostemii alis subobsoletis, basi utrinque in auriculam divergentem productis.

Blassgelb, Hüllblätter, insbesondere Tepala, Lippenmittelstück und Schwielen mit zahlreichen blassröthlichen Fleckchen, daher der Vergleich mit Sommersprossen. *O. caminiophorum*, *lentiginosum*, *Pardalis* sind alle drei durch die winzigen Lappchen, welche die Flügel vertreten, ausgezeichnet. Ich kenne kein *Oncidium Plurituberculatum*, welches diese Eigenthümlichkeit hätte; Lippe und Säule bieten die fernern Unterscheidungs momente, dazu die Zeichnung. Diese Art hat Blüten von der Grösse derer des *O. Harrisonianum* Lindl.

Caracas Wagener.

149. *ONCIDIUM LINEOLIGERUM* Rehb. fl. in Bonpl., May I. 1854. Lindl. Fol. 44:

A sketch of the flower and a few fragments are before me: but they do not enable me to add anything to Prof. Rehb.'s description. It seems to be very near *O. altissimum*, if indeed it be distinct, which is questionable.

Wild in Peru—Warszewicz.

Rchb. fl. Warszewicz l. c. II. 109:

Aff. *O. picturato* callo rhombeo marginibus anticis dentato, disco carinato. lineolis sulcatis postice in basi labelli, alis bilobulis.

Panícula elongata, brachyclada, superne racemosa, ramuli fractiflexi oliganthi a squamis spathaceis (6'' longis, basi 2,5'' latis) stipati, bractee lanceocucullatae $\frac{1}{4}$ — $\frac{1}{6}$ ovarii pedicellati gracilibus occupantes, sepala ac tepala a cuneata basi oblonga acuta, undulata, sepala externa paulo longiora, labellum a basi brevissime unguiculata utrinque auriculatum, auriculæ ligulatae, postice rectilineae, antrorsum sensim in cuneum angustatum longum transeuntes, pars antica reniformis, bilobula, basis labelli infima callo depresso lineolis sulcantibus parallelis notata, callus anticus ascendens, apice rostratus, utrinque pluri (3—5) dentatus, gynostemium gracile; fovea rhombea; alae breves, bilobae, obtusangulae, medio sinuatae, tabula infrastigmatica producta. Die Blüthe ist so gross, wie bei *O. Baueri* Lindl. Nächst *O. picturatum* Rchb. fl., welches grössere Blüten, abgerundete Oehrchen, einen breiteren Nagel der Lippe und andere Schwielen hat. Die Linien am Grunde der Lippe und die zweilappigen Säulenflügel bilden die Hauptkennezeichen. Peru: von Warszewicz.

150. *ONCIDIUM ALTISSIMUM* Swartz. LO. 200. Bot. Reg. t. 1851. Bot. Mag. t. 2990. Lindl. Fol. 44:

Racemes sometimes thirteen feet long, almost simple except quite at the base. Sepals and petals brown and yellow. Lip bright yellow. The column is rather short; its wings wavy and somewhat lobed.

Wild in the West Indies.

Bot. Reg. XXII. (1836.) 1851:

Pseudobulbis subrotundis compressis ancipitibus, foliis (distichis) ensiformibus carinatis acutis, scapo decurvo multo brevioribus, racemo subsimplici, sepalis petalisque labelli longitudine lineari-lanceolatis undulatis, labello apice dilatato bilobo medio constricto basi auriculato, crista enneadactyla, depressa, columnae alis rotundatis abbreviatis undulatis crenulatis.

Ep. altissimum Jacq. stirp. Am. 229. t. 141.

Perigonii phylla 5 viridia brunneo maculato, labellum flavum.

Hook. Bot. Journ. I. 7: Panaramo and Columbia: Cuming. — Lond. Journ. III. 527. Jamaica. Purdie.

151. *ONCIDIUM SPHACELATUM* Lindl., Sert. Orch. sub t. 48. Bot. Reg. 1842, t. 30. Lindl. Fol. 44:

(A) *minus*. Flowers small. Raceme paniced at the base.

(B) *majus*. Flowers larger. A complete panicle.

Remarkable for its brilliant yellow, and the rich brown of the sepals and petals. Its column-wings are always brown at the edges. The two varieties in cultivation seem to be constant in the peculiarities of their respective inflorescence. The buds always, before expansion, curve back the points of the sepals and petals in the form of five recurved horns.

Wild in Guatemala; Malpais—Skinner; Honduras—Loddiges; Mexico—Oaxaca, on trees and rocks, at 2—3000 ft.—Galeotti, 5176; Tabasco—Linden, 1223.

Lindl. Bot. Reg. XXVIII. (1842.) 31:

Pseudobulbis elongato ovatis ancipitibus a latere planiusculis, foliis longis ensiformibus apice recurvis, scapo stricto, racemo composito multifloro, sepalis petalisque lineari-lanceolatis undulatis, labello aequalibus, labello medio constricto basi auriculato apice dilatato rotundato bilobo, crista depressa pubescente a latere dentata apice triloba, columnae alis elongatis truncatis erosis sphacelatis.

Guatemala. Hartweg. Skinner. Mexico. Honduras. Loddiges.

It is immediately known from *Oncidium reflexum*, *Pelicanum*, *Baueri* by the wings of the column, which are long, notched and bordered with brown. Two var. in cultivation, one much handsomer, than the other with larger flowers. This is the inferior sort. — *Perigonium luteum*, *rubropictum*.

Lindl. Sert., 48:

Minus α with smaller flowers and the inflorescence composed only at the base and β . *majus* with brighter yellow flowers and the inflorescence compound as far almost as the apex when the plant is in good health. This peculiarity seems to vary in form of the lip, some of the specimens being almost exactly pandurate.

152. *ONCIDIUM KAPPLERI* Rehb. fl. in litt. Lindl. Fol. p. 45:

Leaves ensiform, in which respect it resembles *O. altissimum*. Column-wings crisp, lobed, extended into a toothed truncated ligulate appendage at the base, resting on a pair of projecting angles. Crest $\frac{5}{3}$. Rehb. distinguishes this which seems very near *O. altissimum*. I have described the details of a sketch sent me by Rehb.: but I have had no opportunity of examining the plant satisfactorily.

Wild in Surinam; Paramaribo, at 1600 ft.—Kappler.

153. *ONCIDIUM CAMINIOPHORUM* Rehb. fl. in Bot. Zeit. 1852, p. 857. L. F. p. 45:

From a sketch of the foliage sent me by Prof. Rehb., this seems to have the habit of *O. flexuosum*. The leaves are bluntly emarginate. The flowers rather smaller, „yellow with much brown; lip yellow“, with some brown in front of the crest. Column slender with no projecting cheeks; the wings very narrow. Crest with one long blunt principal tooth, at the base of which are three small sharp diverging ones on each side, and at the point two little warts. Rehb., who saw it alive in a German garden, compares it to *Suttoni* or *tenuis*.

Wild in the Caraccas; Carabobo—Wagener.

Rehb. l. c.:

Pseudobulbis oblongis compressis monophyllis, foliis oblongis basi attenuatis, apice obtuse emarginatis, abbreviatis, panicula diffusa, perigonii phyllis lanceolatis acutis basi cuneatis, labello brevissime cuneato, statim utrinque in lobos rotundatos dilatato, lobo medio ab angusta basi dilatato, transverse rotundo, apice emarginato, callo depresso baseos in dactylos acutos adnatos producto, tuberculis quibusdam additis, gynostemio recto, apice dilatato, fovea stigmatica rotunda, parte infrastigmatica angustiori, depressa, inornata, alis triangulis deflexis minutis pone basin foveae stigmaticae, rostello retusiusculo, trilobulo.

Blüthen gelb mit viel Braun. Lippe gelb, ein paar braunrothe Flecke auf dem Grunde des Mittellappens. *Oncidium tenue* Lindl. und *Suttoni* Lindl. kann man mit diesem vergleichen: sie haben auch dreieckige, aber gespreizte Flügel. Aus Caracas von Hrn. Keferstein nach Kröllwitz eingeführt. — Rehb. fl. in Bonpl. II. 13: Carabobo 6000' März. Wagener.

154. *ONCIDIUM BAUERI* LO. 200. Lindl. Fol. p. 45:

O. altissimum Bot. Reg. t. 1651.

Often mistaken for *O. altissimum*, from which it differs in its scape being panicked from the very base, in its longer pseudobulbs, and sharply truncated column-wings.

Wild in the West-Indies and Continent; Dominica—Imray in hb. Hooker.

Lindl. G. Chr. 1850. p. 600. p. 600: differs from *Oncidium altissimum* by its contracted panicle.

Lindl. Sert. Orch. sub t. 48:

Pseudobulbis oblongis compressis leviter ancipitibus, foliis lato lanceolatis acuminatis scapo erecto multo brevioribus, racemo composito,

sepalis petalisque labelli longitudine lineari-lanceolatis undulatis, labello apice dilatato emarginato medio constricto basi auriculato, crista novem-tuberculata depressa, columnae alis elongatis truncatis utrinque.

Panama and Continent of Tropical America. Nearly allied to *Oncid. altissimum* in structure of flowers, but very different in its manner of growth, well distinguished by its truncated column—wings.

C. Homoeantha: ** *expansa*. L. F. 45.

155. ONCIDIUM SCHILLERIANUM Rchb. fl. in Bonpl., Ap. I. 1851. L. F. p. 45:

An undetermined specimen of this from Messrs. Booth and Co., of Hamburg, has been in my herbarium sine 1846. Flowers greenish yellow, clouded with brown. It is a very distinct species, of little beauty, with a loose few-flowered twining panicle.

The crest consists of teeth and lamellæ placed thus, $5 \begin{matrix} 3 \\ 2 \\ 2 \\ 2 \\ 5 \end{matrix}$

Wild in —

Rchb. fl. l. c. p. 91:

Convolvulaceo scandens flore ex typo illius *O. sphacelati*, alis tamen angustis utrinque acutis serrulatis aequalibus, stigmatis limbo utrinque unidentato.

Folia oblonga apice attenuata bilobula. Paniculae axes tenues ramosi volubiles elongati. Ramuli flexuosi. Sepala oblonga basi attenuata, summum obtuse apiculatum, lateralia acuto acuminata. Tepala subaequalia nunc paulisper latiora, acuta. Labellum a basi lata triangula (medio tertia angustiori) dilatatum obreniforme; margines postici basilares medio emarginati (hinc bilobuli), margines laterales sensim convergentes. Tuberculatio: centrum a dentibus quadrigeminis occupatum; antepositi dentes majores 3, medio posteriori; apposita utrinque basin versus carina paulo extorsa 3—4 serrulata. Gynostemium abbreviatum crassum cycnicolle. Alae anguste dolabriformes, serrulatae, utrinque acutangulae, anguli superiores antheram ipsam tegentes, sibi convergentes, anguli inferiores divaricati. Androclinium ascendens, postice triangulum. Fovea oblonga, margines laterales membrana unidentata decurrente marginati, in processus rostellaris ligulati retusi bidenticulati basin coeuntes. Tabula infrastigmatica utroque latere sub fovea angulato producta. Hüllblätter grün, mit braun getigert, später gelb. Lippe goldgelb, braunfleckig. Blüten so gross, wie die eines mässigen *Oncidium sphacelatum*. Von Consul Schiller.

156. ONCIDIUM VOLVOX Rchb. in Bonpl., „April I. 1854.“ Lindl. Fol. p. 45:

Another convolvulaceous species, but with bright yellow flowers. The crest consists of a central keel, with a pair of teeth at its base, and on either side two other keels, one behind the other, and each deeply two-lobed. Cultivated in German gardens.

Wild in the Caraccas—Wagener.

Huc: Rchb. l. c. II. 13. (15. Jan. 1854.);

Pedunculo orgyali volubili ramuligero, ramulis a spathulis abbreviatis fultis, ipsis abbreviatis, flexuosis, paucifloris, bracteis squamaeformibus ovarii pedicellati sextam non aequantibus, sepalis tepalisque lanceolatis acutis basi cuneatis, tepalis subbrevioribus, omnibus margine undulatis, labello pandurato, basi utrinque pone gynostemium angulato, dein emarginato, obtusangulo, sensim et continue a baseos angulis angustato, dein late reniformi bilobulo margine denticulato, callo baseos depresso antice acuto, utrinque tri-quadrisserrato, superaddita falcula utrinque pone dentem apicalem nonnullisque nunc pone latera, gynostemio gracili, parte stigmatica ampliata, alis membranaceis rhombeis,

superne acutangulis, basi divaricata latioribus infra obtuse angulatis, nunc margine dentatis, portione infrastigmatica recurva, gracili, limbo tabulae infrastigmaticae utrinque prominulo, apice acutangulo.

Hülle erst grüngelb, dann gelb mit rothen Fleckchen bis gegen die Spitze. Lippe hochgelb, bis zur nierenförmigen Erweiterung roth gefleckt oder (an der Einschnürung) roth gerandet. Blüten denen eines mittleren *O. sphacelatum* gleich gross. Diese, die zwei vorigen und die folgende Art sind mir sämmtlich bis jetzt nur aus der ausgezeichneten Sammlung des Herrn Kefenstein in Kröllwitz zugekommen. Diese Art muss neben einem gewissen *Oncidium Schlimii* Linden stehen. Herr Lindley hat die grosse Güte gehabt, Herrn Linden eine Diagnose zu machen, allein sie ist so ausgefallen, dass man eben in Besitz eines Original-exemplars die einzelnen Momente wohl wird constatiren können. „Labello bilobo rotundato basi angustiore auriculato“, was heisst das? Geht die Lippe vom schmalen Grunde ununterbrochen erweitert bis zur Spitze? Cristae tuberculis quater ternis und columnae alis utrinque acuminatissimis — das sind die zwei Anhaltepunkte, die mich glauben lassen, dass vorliegende Art eine andere sein muss: ist meine Art dieselbe, so ist jene unkenntlich beschrieben. — Diese Pflanze stand über ein Jahr in Knospe. Keine Ecke ihres Gewächshauses war sicher vor ihren Winkelzügen, überall hin stieg oder kroch die unendliche Rispe bis die Zudringliche, um eine Anzahl Stäbe gewunden, zur Einsicht kam, es bliebe ihr nichts mehr übrig, als, als endlich zu blühen. — Ich habe 15 Fuss Länge davon eingelegt. Caracas Wagener.

157. *ONCIDIUM TIGRINUM* Llav. et Lex. Orch. Mex., p. 36. L. O. 203. L. F. p. 45:

O. Barkeri Lindl., in Bot. Reg. 1841, misc. 174. Sertum Orchidaceum, t. 48.

Odontoglossum tigrinum Lindl. Fol., no. 10.

(B) *unguiculatum* Lindl. in Journ. of Hort. Soc., I. 303, c. ic. xyl. Paxt. Fl. Gard., II. ic. 134.

O. ionosmum Hort.

I have seen no wild specimens of this noble plant, whose panicle of flowers, richly spotted with brown, is sometimes a yard high. The flowers, which have a large yellow lip, smell delightfully of violets. B. has smaller flowers, in a panicle, but is hardly worth distinguishing even as a variety. We owe to the acuteness of Prof. Reichenbach the unexpected identification of *O. tigrinum*, the „Flor de Muertos“ of the Mechoacans, with my *O. Barkeri*, which I have every reason to believe was obtained by the late Mr. Barker from the West of Mexico. For the reasoning upon which the description of Llave and Lexarza is made to suit *O. Barkeri*, see Bonpl., Aug. I. 1855.

Wild in Mexico; on the Irapaeon mountains, near Valladolid and Paracho — Lexarza; Mechoacan — Ghiesbreght.

Lindl. Bot. Reg. XXVII. (1841) Misc. 174:

Pseudobulbis ovalibus compressis parum angulatis, diphyllis, foliis angustis erectis membranaceis manifeste petiolo vaginante articulatis, racemi cernui simplicis pedunculo brevioribus, sepalis liberis petalisque lanceolatis undulatis aequalibus patentibus, labelli lobis lateralibus parvis subquadratis intermedio transverso apice inflexo vix emarginato, tuberculo oblongo basi 2—dentato apice obsolete trilobo antice excavato, columnae alis brevibus rotundatis.

Mexico. Barker. Very large flowers of a clear but pale yellow on the lip, and rich brown spotted sepals and petals. The lip is of unusual size, being more than $1\frac{1}{2}$ inch across. It is readily known by its short leaves having a distinct articulation with a sheathing petiole nearly an inch long. The raceme is simple, drooping, of 5–6 flowers altogether a foot long. — Lem. Jard. n. 62.

O. unguiculatum Lindl. Cf. Walp. Ann. I. 789.

O. ionosmum Lindl. G. Chron. 1853, 12. Novbr. p. 126. c.:

Pseudobulbis ovatis ancipitibus leviter costatis triphyllis, foliis pergamenis angustis undulatis recurvis, racemo elongato nutante, sepalis acutis undulatis lateralibus semiconnatis, petalis conformibus, labello transverso rotundato basi auriculis planis rotundatis aucto ultra auriculas unguiculatas crista rostrata obsolete 5-loba, columnae antice sulcatae alis rotundatis, rostello nano.

Resembles *Odontoglossum citrosimum* in habit, pseudobulbs, leaves. Flower stem 2' high, raceme of some 30 very large flowers, emitting the odour of Violets. Flowers resemble *Oncidium unguiculatum*, but they are tetrapetalous. Lip pure yellow, paler below. Sepals and petals spotted with brown. Column has the unusual peculiarity from *Oncidium* of being deeply channelled from stigma to the foot of lip.

Odontoglossum tigrinum Lindl. Fol. *Odontoglossum* p. 5. N. 10:

O. pseudobulbis ovatis ancipitibus 2—3-phyllis, foliis lanceolatis subcoriaceis basi conduplicatis, scapo simplici vel ramoso 3—00-floro, bracteis membranaceis, sepalis petalisque lanceolato-ovatis marginibus revolutis subtus carinatis, labello auriculato ungue convexo margine revoluti obscure denticulato limbo amplissimo carnosio reniformi bilobove undulato, columnae alis subrotundis acuminatis demum stigma claudentibus.

Oncid. tigrinum Llave Orch. Mex. p. 36. L. O. p. 203.

Known only from the description in the work above quoted. Two varieties are mentioned; one with a branched manyflowered spike („near *Oncid. altissimum*“), the other with a slender, attenuated scape, and very slender flowers („*O. gracillimis*“). Pseudobulbs three inches and more in length. Scape two feet high, purplish brown. Flowers 3—5, large, showy, like a tiger's skin, having the smell of the sweetest violets. Sepals and petals yellowish, variegated all over with chesnutpurple tigrine-spots. Lip very large, yellow, not spotted.

It is singular, that a plant like this, used for decoration under the name of „*Flor de Muertos*“ should have escaped all the numerous botanical collectors, who have visited Mexico. It seems from the description to be more like an *Odontoglossum*, than an *Oncidium*, and to be related to *O. grande*, from which it certainly differs in very fragrant flowers, and large yellow spotless lip (labellum maximum luteum immaculatum).

Wild in Mexico; on the Irapaeon mountains near Valladolid, and Paracho—Llave.
Huc: *Oncid. unguiculatum* Klotzsch Cf. Walp. Ann. III. 256.

158. *ONCIDIUM REFLEXUM* Lindl. in Bot. Reg., sub t. 1920. Rehb. fil. Xenia, t. 36, fig. 1. Lindl. Fol. p. 158:

(A) Sepals and petals regularly speckled with brown. Lip with a few red specks at the base.

(B) *pelicanum*. Flowers larger. Sepals bright yellow, spotted with crimson near the base. Lip with a rich crimson stain round the crest.

O. pelicanum Martius in Bot. Reg. 1840, misc. 216, 1847, t. 70.

In reconsidering these critically, I doubt their distinctness. They both have the same habit, and the same column and lip; but in B the crest is smooth and seven-toothed, while in *reflexum* it is downy and five-toothed. But I fear such distinctions are not permanent.

Wild in Mexico.

Lindl. Bot. Reg. XXII. (1837.) sub 1921:

Pseudobulbis ovatis monophyllis, foliis anguste lanceolatis acutis, racemis subcompositis longissimis, pendulis, multifloris, sepalis petalisque linearilanceolatis undulatis acutis reflexis labello aequalibus, labello reniformi emarginato, laciniis lateralibus dilatatis planis, crista depressa tridentata apice bicorni, columnae alis falcatis dentatis.

Mexico. Count Karwinski. — A beautiful species related to *O. altissimum*. There are specimens in the Royal Bavarian Museum, now in my care and the species is cultivated by Messrs. Loddiges. I mistook a specimen of this plant, preserved in Mr. Lamberts Herbarium, for *O. funereum* of La Llave, but that species having lenticular depressed pseudobulbs must be different.

Rchb. fil. Xenia I. p. 93. Tab. 36. I.:

Aff. *Oncidio caesio* Rchb. fil.: pseudobulbis foliisque viridibus, labelli lobis posticis obtuse ligulatis retrorsis sensim et breve obtusatis in lobum medium reniformem apice trilobum paulo latiore, callo baseos gibberoso plurituberculato antrosum bicurvi, columnae alis semiovatis apice nunc acutis.

Oncid. funereum L. O. 201. ffd. Lindl. B. R. I. c.

„Pseudobulbi ovati monophylli. Folia angusto lanceolata acuta“ Lindl. l. c. Pedunculus sesquipedalis ramulis paucis remotis flexuosis paucifloris. Bractee ovariiis pedicellatis (an exsiccatione?) arcuatis multiplo breviores. Sepala et tepala cuneato lanceolata acuminata (aequalia) stellata hinc paulo undulata; atropurpurea concoloraria fuisse videntur exceptis apicibus pallidioribus. Labellum supra descriptum album fuisse videtur maculis quibusdam atropurpureis supra isthmum et tuberculum. Gynostemium gracile: tabula infrastigmatica utroque margine antico obtusangula.

Sert. sub tab. 48:

Labelli laciniis lateralibus vix intermedia angustioribus, crista depressa tridentata apice bicorni leviter pubescenti, columnae alis magnis falcatis dentatis. Mexico.

Distinguished from *O. pelicanum* by its smaller flowers having the lip no longer than the sepals and by the lateral lobes of the lip being about as broad as the middle lobe.

Oncid. pelicanum Hort. Monac. Bot. Reg. XXVI. (1840.) Misc. 216:

A specimen from Mr. Bateman, who received it from the bot. garden of Munich shows this plant to be very closely akin to *O. reflexum*, from which it differs principally in the sepals and petals being less blotched, in the lateral lobes of the lip being smaller in proportion to the intermediate segment, and in the tubercles of the crest, which is smooth, not downy, being rather differently arranged. I am unable to judge how far it may be entitled to rank as a distinct species. The name has doubtless been given in allusion to the column which is not unlike a pelican pecking her breast.

Lindl. Sert. sub 48:

Pseudobulbis ovalis sulcatis monophyllis, foliis anguste lanceolatis acutis, racemis subcompositis multifloris, sepalis petalisque linearilanceolatis undulatis acutis reflexis labello multo brevioribus, labello reniformi emarginato, laciniis lateralibus rotundatis intermedia multo angustioribus, crista glabra basi convexa tunc dentata apice bidentata, columnae alis magnis oblongis denticulatis apice acutis.

Very close akin to *O. reflexum*, from which it differs principally in the sepals and petals being less blotched, in the lateral lobes of the lip being smaller in proportion to the intermediate segment and in the tubercles of the crest, which is smooth, not downy, being rather differently arranged.

159. *ONCIDIUM CAESIUM* Rchb. fil. in Regel's Gartenflora, t. 80. Xenia Orch. t. 36. fig. 2. Lindl. Fol. p. 46:

Very like *O. reflexum*, under which name it was received in Mr. Keil's garden at Leipsig, from Allardt of Berlin. Prof. Rchb. distinguishes it by the short ears of the lip, the larger flowers with a very much more refracted dorsal sepal, and its caesious colour. A fresh flower with which he has favoured me corresponds exactly with his statement.

Wild in ——. Described from a German Garden.

Rehb. fl. Xenia I. p. 94:

Aff. *Oncidio reflexo* Lindl. *Pseudobulbo foliisque caesiis, labelli lobis posticis quadratis retusis divaricatis abrupte ac rectangule in isthmum angustum transeuntibus, lobo medio reniformi bilobo subduplo latiori; callo baseos paucipapuloso antrorsum bicruri, columnae alis dolabriformibus apice obtuse acutis.*

Sqq. citata. — *Pseudobulbi ovati oblongi compressi utrinque media linea costati: diphylli; pollicem seu sesquipollicem longi, immaculati. Folia lineariligulata erecta, 5—6 pollices longa, medio unum pollicem lata. Pedunculus gracilis erectus subpedalis, apice quadriflorus, brunneus, viridistriatus maculatusque paucivaginat. Bractee lineares membranaceae ovarii pedicellati quartam aequantes. Sepala et tepala cuneato lanceolata acuta, margine nunc hinc undulata. Sepalum summum prima jam anthesi, cetera sepala ac tepala demum reflexa. Labellum trilobum, lobi laterales subquadrati obtusanguli et divaricati, lobus medius brevissime angusteqe unguiculatus („isthmus“) in laminam illis lobis subduplo latiore quadratam obtusangulam apice bilobam dilatatus. Callus velutinus tumidus in basi, dorso convexus, apice bicruris cucullo interjecto ac superposito, papulis quibusdam lateralibus. Gynostemium subcurvatum; alae dolabriformes, hinc crenulatae apice obtuse acutae, tabula infrastigmatica prominula, medio excavata, utrinque trapezoidea. Sepala ac tepala caesia parce atropurpureo guttata; labellum citrinum.*

Gard. Chronicle 1854. 219: This is certainly a mere variety of *Oncidium reflexum*, with leaves more glaucous, than usual, owing perhaps to bad cultivation. Such differences as are pointed out in the figure and description, if sufficient to establish a species, would lead to the subdivision of every species of *Oncidium* yet known and to a multiplication of names, which can only render a subject, already sufficiently difficult, altogether impenetrable. The plant has no horticultural value.

160. *ONCIDIUM PIRARENSE* Rehb. fl. in Linnaea, XXII. 846. Lindl. Fol. p. 46:

Very different from the species near it, except *O. sessile*, in its large flowers with broad bluntly spreadings, not reflexed sepals and petals. The crest, which is remarkable, is described by Rehb. as a single callosity with three lobes, of which the lateral are angular and obtuse, the middle one longer and emarginate.

Wild in Guiana; near Pirara—R. Schomburgk.

Cf. Walp. Ann. III. 557.

161. *ONCIDIUM SUAVE* Lindl., in Bot. Reg. 1843, misc. 22. Paxt. Fl. G., II. ic. 135. Lindl. Fol. p. 46:

O. Wendlandianum Rehb. fl. in Bonpl., Ap. I, 1854.

O. macropterum A. Rich. et Galeott. Orch. Mex.

O. Tayleuri Hort.

Its brown reflexed sepals and petals, yellow lip with a broad cinnamon stain at the base, rounded column-wings, and peculiarly straggling inflorescence mark this satisfactorily. In *O. Wendlandianum*, from the garden of Herrnhausen, for which I am indebted to Prof. Rehb., the leaves are longer and broader, than usual. *O. macropterum* from Galeotti himself (no. 5046 bis), is also from Oaxaca, and no doubt must be also referred to this place.

Wild in Mexico—Schiede, Galeotti; near Oaxaca, at Teoxomulco, on *Pinus Teocote*—Karwinski in hb. Monac.

Huc Lindl. l. c. XXIX;

Pseudobulbis ovatis compressis utrinque bicostatis, foliis membranaceis lineari oblongis canaliculatis acutissimis, panicula elongata ramosa, sepalis petalisque linearilanceolatis acutis undulatis revolutis, labelli lobis lateralibus rotundatis intermedio transverso apiculato minoribus, tuberculo pubescente antice 5-lobo apice bidentato, columnae alis rotundatis denticulatis.

Mexico. Loddiges; very near *O. reflexum*. The flowers are much smaller, the sepals and petals chocolate colour, tipped with yellow; the lip yellow, with a cinnamon brown middle. The wings of the column are yellow. It has a faint and agreeable odour. It was sent to Messrs. Loddiges by Depe in the year 1835.

Huc ex Lindl.: Ann. Sc. nat. 1845. p. 26; *Oncid. macropterum* Rich. et Gal. t. 32:

Pseudobulbis ovoideo-oblongis 2-phyllis; foliis lanceolatis; scapo ramoso paniculato, gynostemii alis latissimis truncatis, labelli lobis lateralibus obtusis, intermedio transverso, emarginato. Mexico.

Obs. *Oncid. Wendlandianum* Rehb. fl. Bonpl. II. (1850) p. 91:

Aff. *O. ansifero*: recedit tuberculo apice mutico, ungue lobi medii breviori, latiori, tabula infrastigmatica haud ita angulata, alis angustioribus.

*Pseudobulbi 4 pollices longi, prope duos medio lati, oblongi, subcompressi, obtuse acipites, utrinque tricostati, diphylli. Folia ligulata, basi attenuata, bene acuta, subbipedalia; medio paulo ultra bipollicaria. Panicula laxissima flexuosa pro magnitudine pauciflora, quadripedalis. Ramuli pauciflori, pedicelli incurvi, subpollicares bracteas hyalinas lanceas abbreviatas longe superantes. Perigonii phylla oblonga acuta undulata aequalia. Labellum trilobum, lobi laterales dolabriformi rhombeo, dorso convoluti, hinc quasi lineares, lobi medii unguis basi labelli dimidio aequilatus, subreniformis, sed basi abrupte hastatus, antrorsum paulo angustatus, apice sinuatus, bilobus cum apiculo interjecto, margine parvicrenulatus, tuberculum baseos hemisphaericum pluripapulosum, apice bicrure, regio anteposita velutina (more *O. Suttoni*). Gynostemium abbreviatum, rectum, crassum, androclinium subobliquum, supra foveam stigmaticam utrinque unidentatam, dentes transversj parvi, processum rostellarem tegentes, fovea ipsa parva transversa, tabula infrastigmatica medio unisulcata; alae angustae, extrorsum retusae minutissime crenulatae, apice acutae. Hülle bräunlich mit Stich ins Olivengrün, endlich zimmtroth; an der Spitze gelb vorgestossen. Lippe gelb, mit brauner Querbinde und einige solcher Flecke vor dem Grunde. Cultur des Herrenhauser Berggartens.*

Num vere an *Oncid. suave* Lindl. pertineat, mihi non liquet. — Rehb. fl.

162. *ONCIDIUM ANSIFERUM* Rehb. fl. in Bot. Zeit. 1852, p. 695. Lindl. Fol. p. 46:

Well distinguished from *O. suave*, which it is very near, not only by the middle point of the crest being prolonged into a downy beak, but by longer and more wavy sepals and petals, a very short column, the cheeks of which, although very prominent, are scarcely discoverable above the crest, and by the crest itself having a lobed tooth on either side at its base.

Wild in Veragua; Chiriqui, at 8000 ft.—Warczewicz.

Rehb. fl. l. c.:

Phyllis oblongo-obovatis crispulis, externis unguiculatis, sensim dilatatis, labelli auriculis basilariibus ligulatis, postico margine curvilineis, labelli cuneo lato sensim angustato, subito in laminam reniformem dilatato, antice emarginato, callo basilari angusto, brevi, antice in rostrum uncinatum attenuato, superne carinato, utrinque trigyroso, gynostemii brevissimi recurvati alis oblongis paucicrenatis, alis corneis inferioribus extrorsum curvatis, ansam simulantibus.

Die fünf Hüllblätter einfarbig, grünlichschwarz (nach der trocknen Pflanze — höchst eigenthümliche Färbung!), mit gelben Spitzen. Lippe goldgelb, mit 2 schwarzbraunen Querbinden am Grunde, welche am Rande in einander übergehen. Nächst *O. suave* Lindl. Allein die Verzweigung ganz verschieden, schlaff. Die Handhaben an der Säule, die Farbe und der Schnabel an der Lippenschwiele zeichnen es aus. Chiriqui.

163. *ONCIDIUM MICROSTIGMA* Rehb. fl. in Bonpl. April I. 1884. L. F. p. 46:

„Sepals and petals orange-yellow; lip pale, almost white.“ I have a single flower

and a drawing. From the latter it appears, that the crest is very different from that of *O. suave*, to which I should have otherwise referred it; the centre of the crest consists of three equal sharp teeth, with a very small one in the angles; in addition to which there are two large front teeth, which stand below the others, and curve backward. It is described as having the habit of *O. ansiferum*.

Wild in ——. Obtained by Rehb. from Consul Schiller's garden.

Huc *Oncid. microstigma* Rehb. fil. l. c. p. 90:

Nulli affine, *O. ansifero* et *Wendlandiano* simile, callo duplici, imbricante, postico tridactylo ornithopodo, antico retrorsum semilunato a dactylis illius tecto, alis dolabriformibus.

Panicula laxissima, ramuli erecto ascendentes pauciflori, rariflori, bractee ovatae, acutae, abbreviatae. Perigonii phylla undulata. Sepala oblonga acuta basi valde angustata cuneata. Tepala subaequalia sessilia. Labelium sepalis vix brevius, trilobum, lobi basillares rotundati obtuse humerati, lobus medius a basi ligulata obtusata dilatatus, transverse rotundus, obreniformis, inde bilobulus. Tuberculatio in ima basi: tubercula duo transversa sibi opposita ac extremitatibus imposita, posticum trilobum lobis acute triangulis, lateralibus divergentibus interposito utrinque in sicco lobulo minuto (figura hinc ornithopoda); tuberculum anticum semilunatum, apicibus tectis a lobis lateralibus tuberculi postici. Gynostemium cycnicolle (seu incurvum) superne ampliatur. Alae dolabriformes extus minutissime lobulatae, androclinium ascendens, postice acutum; rostellum dens linearis retusus bidentatus parvus, carinae regionis tabulae infrastigmatica sub ipso stigmate contiguae, dein divergentes, inde marginales. Blütenblätter orange-gelb, Lippe hell, wohl weiss. Rispe u. s. w. stimmt mit *Oncid. ansiferum* Rehb. fil.

164. *ONCIDIUM POLYCLADIUM* Rehb. MSS. Lindl. Fol. p. 47:

O. folio lanceolato-lorato, panicula homoeantha longa angustissima ramulis spathaceo-bracteatis valde flexuosis sub-quinque-floris, sepalis petalisq. lanceolatis undulatis acutis, labelli lobis lateralibus runcinatis subito in intermedium duplo latiore subrotundum bilobum transeuntibus, crista triloba adjectis dentibus 2 sub apice et 2 alteris juxta basin, columnae alis triangularibus acutis buccis conicis.

Flowers seem to be coloured as in *O. Baueri*; but they are as small as in *O. pentadactylon*, and appear in a long, very narrow raceme, the lateral branches of which are not more than one inch and a half long, in about fourflowered right-angled zigzags. The spathaceous bracts are as long as the internodes, or even longer.

Wild in Costa Rica, Veragua; Chiriqui—Warczewicz.

165. *ONCIDIUM TENUE* Lindl., in Journ. Hort. Soc., III. 76, c. ic. xyl. L. F. p. 47:

Pseudobulbs extremely thin. Flowers in a straggling raceme or imperfect panicle, the size of those of *O. suave*. I have had it from Sir Philip Egerton with pseudobulbs as broad as the hand, and a panicle four feet long. The supposed variety mentioned in the seventh Vol. of the „Hort. Soc. Journal“ will be mentioned further on (see no. 169).

Wild in Guatemala—Hartweg; Mexico, near Oaxaca—Galeotti, 5324.

Cf. Walp. Ann. I. 788. — Journ. Hort. Soc. III. p. 77:

A small *Oncid* remarkable for its exceedingly thin pseudobulbs, which although 2—3 inches long, are not more than $\frac{1}{8}$ of an inch thick in the middle, from which they gradually flue away into an edge, which is almost acute. The leaves are thin oblong lanceolate, and much shorter than the slender narrow racemose panicle, the branches of which are nearly of the same length, each bearing 3—4 flowers. The latter are not unlike those of *O. Suttoni* in size and colour, that is to say, yellow, mottled with brown.

This species is distinct from *Oncid. suave* by its broader leaves and acutely triangular column wings; and from *O. citrinum* by its roundish oblong pseudobulbs, large column wings, broad leaves, habit etc.

166. *ONCIDIUM SUTTONI* Bateman in Bot. Reg. 1842, misc. 8. Paxton Fl. Gard., II. ic. 129. Lindl. Fol. p. 48:

A species of little interest, with narrow grassy leaves, and very long drooping paniced racemes, of dull yellow and brown flowers.

Wild in Guatemala; Medio Monte, where it grows with *O. ornithorrhynchum*—Skinner.

Lindl. B. Reg. XXVIII. l. c.:

Pseudobulbis ovatis compressis sulcatis diphyllis, foliis linearibus gramineis saepe scapo aequalibus, scapo simplici vel ab ipsa basi paniculato angusto ramulis 3—5-floris, sepalis petalisque lineari-lanceolatis, planis, labello oblongo basi auriculato angustiore, tuberculo cristae 7—9 dentato, columnae alis triangularibus.

Mexico. Skinner.

The grassy leaves often as long as the erect panicles although sometimes much shorter, give it a peculiar appearance, added to which the sepals and petals are a dull olive brown without any spots, except at the point, where they are yellow, while the lip has also but one dull olive brown without any spots, except at the point where they are yellow, while the lip has also but one dull olive brown spot occupying the centre of the base.

Capt. Sutton R. N. brought many valuable plants to England from America.

Pseudobulbs 1—1½" high, flower stems few flowered, usually shorter, than the leaves and drooping. Occasionally the spike is longer, and a little branched, but this is very rare. Bateman.

Sert. sub 48: The triangular form of the wings of the column will readily distinguish it from *O. pergamenum*, which has also the lip broadest at the base and entirely different leaves.

167. *ONCIDIUM LEUCOCHILUM* Bateman Bot. Reg. t. 1920. Orch. Mex. t. I. L. F. 49:

Cyrtochilum leucochilum Planchon, Fl. des Serres, t. 522.

(B) *digitatum*. Fingers of the crest nine at least, instead of five.

O. digitatum Lindl. in Benth. Pl. Hartweg., p. 94. Paxton l. c. ic. 138.

Many varieties in colour of this beautiful plant are found in gardens; one with chocolate-brown stains on the flowers, another with brown flecks on a green ground, and a third of one dull olive-brown tint. In all of them the lip is snow-white when first open, becoming yellowish afterwards. But I have seen with Sir Philip Egerton a flower just opened, the lip of which was perfectly yellow; the other flowers having white lips as usual. According to Mr. Skinner, the summer temperature of the country where this species grows wild is between 55° and 70°; he adds that in December, 1839, the thermometer in Guatemala, at 6 A.M., in the open air, for three days, averaged 36°, and yet the plants continued to shoot their young stems.

Wild in Mexico; on mountains near Malacatan—Hartweg; Guatemala, in the cold districts—Skinner.

Bot. Reg. XXIII. 1837. sub 1920:

Foliis —, pseudobulbis —, scapo alte paniculato longissimo, sepalis petalisque oblongis obtusis subaequalibus patentissimis, labello reniformi alte bilobo utrinque emarginato, laciniis lateralibus retusis nanis, crista tricorni basi utrinque dentata, columnae alis acinaciformibus dentatis. („crenulatis“ in Bat. Mex.).

A noble species with all the habit and stature of *Oncidium Baueri*. Flowers greenish, banded with crimson; lip pure white.

Bat. I. 37:

Pseudobulbis ovatis sulcatis 1—2phyllis, foliis ensiformibus recurvis solitariis geminisque scapo exaltato panicula multo brevioribus etc.

Sert. sub 48. (1841.) Mr. Skinner: inhabits countries the temperature of which is not less than 55° or 70°. In Dec. 1839 thermometer at Guatemala at 6 in the morning in the open air for 3 days averaged 36° Fahr. and yet this species continued to shoot its young stems.

Oncidium digitatum Lindl. Benth. Hartw. 94:

Pseudobulbis ovalibus nitidis compressis diphyllis, foliis lineari-oblongis patulis obtusis, scapo stricto racemoso paniculato, ramis latera- libus paucifloris, sepalis liberis petalisque oblongis planis, labello ob- ovato bilobo basi auriculato, crista pentadactyla digitis filiformibus ascen- dentibus intermedio integro lateralibus bipartitis, columnae alis acinaci- formibus denticulatis. Guatemala.

Near *O. leucochilum* like which it has a white lip; numerous fingerlike processes of that organ readily distinguish it.

168. *ONCIDIUM OBLONGATUM* Lindl. in Bot. Reg. 1844, misc. II. Paxton l. c. ic. 137. Lindl. Fol. p. 48:

O. xanthochlorum Klotzsch, fide Rehb. in litt.

Flowers large, clear sulphur-yellow, with a few pale reddish-brown spots. Petals rather wider than sepals, and much more blunt. Lip with the middle lobe deeply fissured, inclining to four-lobed, the outline being bluntly angular. I have a sketch of this with three stigmatic glands; one in the usual place, and the two others at the base of the two column-wings.

Wild in Mexico—Loddiges.

Lindl. Bot. Reg. XXX:

Facie et structura O. reflexi, sed petalis oblongis obtusis apiculatis patulis, planis, labello alte bilobo, columnae alis rotundatis crenulatis dimidiatis.

It is almost impossible to find words, that will well distinguish the *Oncidia* allied to *reflexum*, and yet they appear to merit distinction. This which is from Mrs. Loddiges, has very much the appearance of *O. Wentworthianum*, with the same clouded pseudobulbs and speckled flower-stem; but its petals are perfectly flat, not at all reflexed or wavy, obtuse with a little point and clear yellow, with a few reddish brown bars near the base.

It is a very handsome species on account of its flowers having as much yellow in them, and being as large, as the best variety of *O. sphacelatum*.

Huc forsân: *Oncid. xanthochlorum* Klotzsch Semin H. Berol. 1852, p. 13:

Pseudobulbis parvis, brevivalibus nitidis, compressis, ancipitibus, diphyllis, foliis membranaceis, rigidis, erectis, oblongis, brevissime cuspidatis, inferne attenuatis, conduplicatis, dorso carinatis, scapo sub- simplici arcuatim recurvo brevioribus; bracteis aridis lanceolatosubulatis; perianthii foliolis exterioribus interioribusque oblongis, basi apiceque angustatis, acutissimis, disjunctis, subaequalibus, patenti recurvis sub- undulatis, labello brevioribus pallide viridibus, dilute fusco maculatis; labello citrino immaculato, lobo medio lato reniformi emarginato, laci- niis lateralibus patentirectis obtusis, crista glabra convexa multituber- culata, antice tridentata, dente medio brevior; columnae alis magnis patentibus, truncato denticulatis.

169. *ONCIDIUM DELUMBE* Lindl. Fol. p. 48:

O. tenue grandiflorum Lindl. in Hort. Soc. Journal, VII. 271, ic. xyl:

Whole habit that of *O. tenue*, with the same thin pseudobulbs and loose straggling panicle. But the flowers are larger, the back sepal is so much reflexed as to be

almost parallel with the peduncle, giving the flower a brokenbacked appearance, the lip is broad at the base, etc.

Wild in Guatemala—Skinner.

170. *ONCIDIUM NEBULOSUM* Lindl. in Bot. Reg. 1841, misc. 175. Lindl. Fol. p. 48:

O. Geertianum Morren in Ann. Gand., Feb. 1848.

O. Klotzschianum Rehb. fl. in Bot. Zeit. 1852, p. 695.

A flower from Prof. Rehb. identifies the second synonym. The plant is rarely seen in gardens. Like so many others this varies in the size of its flowers, which, however, are always pale yellow, with faint spots of brown at the base of the lip, and on both sepals and petals.

Wild in Guatemala—Skinner; Veragua, Chiriqui, at 4—5000 ft.—Warczewicz,

Bot. Reg. XXVI. (1841) Misc. 175:

Pseudobulbis ovalibus ancipitibus nervulosis diphyllis utrinque tricostratis, foliis angustis chartaceis panicula angusta brevioribus, sepalis liberis petalisque lanceolatis undulatis patentibus, labelli lobis lateralibus nanis rotundatis intermedio subrotundo bilobo, tuberculo sulcato tridentato, columnae elongatae alis acinaciformibus denticulatis.

A fine species with something the appearance of *O. reflexum*, but readily known by its clouded pseudobulbs. The flowers are large, rather pale yellow, with faint spots of brown at the lip and on the sepals and petals. It is a native Guatemala, whence it has been sent to the Hort. Soc. by Mr. Hartweg.

Huc: *Oncidium Klotzschianum* Rehb. fl. in v. Schl. Bot. Ztg. 1852, p. 695:

Perigonii phyllis cuneatis oblongis aculis, lateralibus internis magis dilatatis, labelli lobis lateralibus auriculaeformibus, obtusatis, sensim in unguem lobi medii attenuatis dein reniformis, bilobi, callo baseos continuo parvo, antice utrinque late tridentato, dorso carinato; gynostemii alis rhombeis, margine exteriori denticulatis, angulo superiori longe acuminatis, androclinium excedentibus, lamella transversa supposita gynostemium utrinque excedente.

Prächtige goldgelbe Blüthe mit dunkelrothen Flecken auf den Hüllblättern und dem Lippengrunde. Nächst *Oncidium pelicanum* v. Mart., aber durch Säulenflügel weit verschieden. Rispe gedrängt, niedrig. Blätter länglich, spitz. Chiriqui Cordillere 4—5000'.

Huc: *Oncid. Geertianum* Morr. fid. Lindl. Paxt. Fl. G. I. 23.

171. *ONCIDIUM CALDENSE* Rehb. fl. in Linnaea, XXII. 846. Lindl. Fol. p. 49:

A straggling plant, with yellow flowers spotted with brown. The petals are broader than the sepals, more ovate, and like them very acute. The crest consists of five long, blunt, somewhat cylindrical, rugged processes next the column, and three others rather larger in front. It is much like *ramosum* (no. 185), but the crest is totally different, with none of the additional threads and varicosities of that species. It also seems to be a plant with a more lax panicle.

Wild in Brazil; Minas Gerães—Regnell; Gongosoco—Loddiges,

Cf. Walp. Ann. III. 557.

172. *ONCIDIUM REICHENBACHII* Lindl. Fol. p. 49:

O. foliis oblongo-loratis obtusiusculis, panicula elongata angusta debili ramulis retrofractis flexuosis, sepalis petalisque lineari-lanceolatis acuminatis undulatis, labello obtuse lunato bilobo lobis posticis rectangularibus rotundatis latiore, cristae dentibus juxta columnam acervatis in fronte tribus filiformibus, columnae alis hastatis acuminatissimis.

The very imperfect definition given of *O. maizaefolium* in the „Orch. Lindenianae“ has led to this plant being taken for it by Prof. Reichenbach. It differs in the lower angle of the column-wings not being extended downwards into an acute lobe, and in

its long narrow panicle, with divaricating branches. The flowers are said to be „yellow spotted with brown“ in Ocanna, and „yellow spotted with red“ in Merida. My specimens of the first are also stronger than the other, with less-zigzag side branches. I propose to name it in honour of my very sharp-sighted and indefatigable fellow-workman in this difficult mine.

Wild in New-Grenada; in the province of Ocanna, at 5000 ft.—Schlim, 27; Venezuela, at Laguneta, in the province of Merida, at 7000 ft.—Fünck and Schlim, 1030.

O. maizae-folium Lindl. (?) Rchb. fl. Bonpl. II. 279: Es ist unmöglich, nach der Diagnose die Art ganz sicher zu bestimmen. Jedenfalls steht sie nächst *pictum* Hb. B. Kth. und ist eine wahre Prachtpflanze wegen der unzähligen schön gefärbten Blüten. Ocanna. Juli. 5000'. Nr. 27. Schl.

173. *ONCIDIUM MAIZAEFOLIUM* Lindl. Orch. Lind. no. 78. Lindl. Fol. p. 49:

Leaves nearly one inch and a half wide, coarsely ribbed (when dry). Flowers in a very large entangled branching panicle. „Petals bright yellow, spotted with red. Lip pale yellow.“ Very distinct from the preceding. I have it from Mr. Rchb. as *O. Schlimii*? gathered in N. Grenada, by Warzewicz.

Wild in Venezuela; forests on the slope of the Sierra Nevada, in the province of Merida, at 7000 ft.—Linden.

Lindl. l. c. *O. Lind.*:

Foliis lanceolatis multinerviis, panicula ramosissima imbricata ramulis flexuosis, sepalis petalisque lineari-oblongis obtusis undulatis patentissimis, labello apice reniformi basi triangulari pubescente crista multidentata, columnae alis acinaciformibus sursum elongatis.

Sierra Nevada in the province of Merida. August. Pseudobulbs oval ribbed; stem two feet high. (Nr. 681.).

One of the herd of species allied to *O. reflexum* and *pictum*. The leaves are a foot long, or less.

174. *ONCIDIUM SESSILE* Lindl. in Paxt. Fl. Garden, t. 21. Lindl. Fol. p. 49:

The large golden-yellow flowers rival those of *Cavendishianum*. Their broad oblong sepals and petals, with a few cinnamon spots at the base, are remarkable. *O. pirarense* (no. 160), with flowers of a similar form, has long auricles to the lip, and a totally different crest.

Wild in the Caraccas; Santa Martha—Purdie.

Lindl. l. c. cf. Walp. Ann. III. 555.

175. *ONCIDIUM ENSATUM* Lindl. in Bot. Reg. 1842, misc. 15. Lindl. Fol. p. 50:

Panicle very open, once only branched, gracefully bending at the point, with conspicuous herbaceous mucronate bracts. Leaves narrow, like a straight two-edged sword.

Wild in Guatemala—Skinner; Mexico: near Oaxaca—Hartweg.

Lindl. Sertum 1841 sub 48:

Pseudobulbis subrotundis compressis, foliis ensiformibus strictis carinatis, panicula longissima multiflora, bracteis membranaceis acutis canaliculatis, sepalis petalisque lanceolatis acuminatis subundulatis, (olivaceis luteo-marginatis), labello (luteo) reniformi emarginato basi auriculato (disco olivaceo) crista pubescente subseptemtuberculato tuberculis elongatis, columnae alis emarginatis utrinque acutis.

Guatemala.

Singular long sword shaped erect leaves, panicle like that of *altissimum*. Flowers yellow in the lip and on the border of the segments, about olive brown in the middle of the lip and the face of the segments.

176. *ONCIDIUM DICHROMATICUM* Rehb. fil. in Bonpl., Ap. 1, 1855. L. F. p. 50:

The leaves of this are undescribed, and I am not certain how it is to be distinguished well from *O. ensatum*. The flowers are smaller, and the sepals and petals shorter, the latter being somewhat the widest. In the crest it would seem that more distinctions occur; for according to a sketch by Mr. Rehb., that of *O. dichromaticum* is two-lobed at the base, with only a pair of long legs in front, and a short tooth between, while in *O. ensatum* it is distinctly five-lobed, in addition to the two front legs. These would seem to be sufficient differences.

Wild in ——. Cultivated by Booth and Sons, of Hamburg.

Rehb. fil. in Bonpl. III. 215:

Aff. *O. tigrato tepalis bene acutis, callo velutino sexdentato, gynostemii recti alis utrinque acuminatis.*

Pseudobulbi maculato nubeculosi. Panicula —. Sepala lanceolata acuta undulata. Tepala oblonga obtuse acuta magis undulata. Labellum a basi subcordata utrinque auriculatum dein late constrictum, ac subito cordatum, margine sinuatum, apice bilobum lobo altero alteri imposito. Callus baseos velutinus oblongus, basi latiori utrinque extrorse bilobo, apice in carinas duas exiens. Gynostemii alae angustae utrinque falcatae. Tabula medio utroque margine emarginato. Foveae limbus dimidio superiori latius marginatus. Blüten so gross wie die des *O. Baueri*, gelb und braun. Lippe auf schmalem Mittelstück braun mit wenigen gelben Fleckchen. Hüllblätter dicht braun gewölkt auf gelbem Grunde. — Cultur der Herren Booth und Söhne.

177. *ONCIDIUM GUTTULATUM* Rehb. fil. in litt. Lindl. Fol. p. 50:

The following is Prof. Rehb.'s description: — „Sepala lanceolata, acuta, undulata, ultra medium basin usque brunneo picta. Tepala (Petala) latiora, undulata, apicibus inflexis. Labelli sessilis auriculae basillares obtusae in isthmum obtusum constrictae; apex basi aequilatus, reniformis, bitubulus. Isthmus brunneo fasciatus. Callus baseos (crista) depressus, minute pulverulus, panduratus, apice tridentatus, lateribus hinc minute serrulatus, albidus, fusco-guttatus. Gynostemium (Columna) curvatum, gracile; rostellum trilobum; alae angustae quadratae, utrinque obtusangulae.“ — The appearance of the specimen before me is that of *Onc. lentiginosum*.

Wild in ——. Obtained from the garden at Herrenhausen.

178. *ONCIDIUM CRUCIFERUM* Rehb. fil. in Bonpl., May 1, 1854. Lindl. Fol. p. 50:

Near *O. excavatum*, but with a cruciform crest toothleted at the end beaked in the disk, with retuse somewhat lobed column-wings. Panicle long, with a few distant straight branches, the lowest of which are fiveflowered. Intermediate as to petals between the macropetalous and micropetalous groups. Auricles of the lip with long narrow ungues. — Rehb. fil. In my solitary flower the isthmus connecting the base and apex of the lip is very long, and the crest is remarkable for a long downy incurved horn standing at right angles to a pair of flat emarginate teeth; in addition to which there are four warts, two below the teeth, and two at the base of the horn.

Wild in Peru—Warczewicz.

Rehb. fil. Warzewicz l. c. II. 109:

Aff. *O. excavato callo cruciformi apice denticulato, disco rostrato, alis retusis lobulatis.*

Panicula elongata: rami rari, remoti, recti, seu vix flexuosi, infimi —5flori, bracteae spathaceae acutiusculae ovaria pedicellata quarta parte aequantes, sepalum summum a basi angustissime cuneata lanceolatum acutum, undulatum, sepala lateralia subaequalia, longius unguiculata; tepala sessilia seu subsessilia paulo latiora, labellum basi angusta cuneatum, dein utrinque oblique retrorsum ligulato retusoque auriculatum, auriculae antice in unguem linearem longum angustatae; labelli portio

antica oblongo transversa basi utrinque semicordata, apice bilobula, ceterum hinc minute lobulata, quam portio basilaris paulo latior, callus basilaris depressus subvelutinus, utrinque antrorsum in brachium lineare apice retuso denticulatum expansum antice in cristam ancipitem velutinam excurrens, cui addita utrinque basi et apice cristula antrorsa; gynostemium gracile incurvum; alae angustae trilobulae, tabula ab apice angusto dilatata; rostellum reflexum, ligulatum breve. Eine unverkennbare Aehnlichkeit mit *Oncidium excavatum* Lindl. 1 mit dem es eine Art Mittelglied der Macro- und Microtepala bildet. Dies hat eine kurze Säule, mit breiteren, beilförmigen Flügeln; die Sepala sind sich gleich lang und am Grunde viel breiter; die Lippe ist vorn und am Grunde gleich breit, hat kein herzförmiges, sondern ein keilförmiges Vorderstück und vorn in der Mitte einen zahnförmigen Zipfel; die Grundschiwiele ist anders gebaut. Bei beiden steigt die Lippe am Grunde etwas an. Peru v. Warczewicz.

179. *ONCIDIUM CEREBRIFERUM* Rehb. fl. in Bot. Zoit. 1852, p. 695. L. F. p. 50:

Much like the last in the form of the flowers; but the column is very short, with its cheeks verruciform, prominent, and almost hidden by the crest. Of the latter the centre is occupied by a thick, downy, blunt tooth, on each side of which are about four smoother short tubercles. It is very much like *O. ansiferum* (no. 162), with which it must be further compared.

Wild in Veragua; Chiriqui, at 4—6000 ft.—Warczewicz.

Rehb. fl. Bot. Ztg. 1852, p. 695:

Perigonii phyllis cuneatis, oblongis, acutis, undulatis, subaequilongis, lateralibus internis latioribus, labello basi biauriculato, auriculis obtusis, lobo medio a basi late cuneata subito dilatato, oblongo transverso, antice emarginato, margine leviter crenulato, callo basilari parvo rotundato, ex acervulo callulorum lato carinatorum 7—9 congesto, cerebrum aemulante, gynostemii recurvi alis dolabriformibus microscopicè crenulatis, baseos lamellis 2 marginalibus.

Rispe ähnlich gebaut, wie die des *O. Baueri*. Blüten so gross, rothbraun mit schmalem gelben Rand. „Lippe weiss, am Grunde fleischroth, der Buckel violett.“ Chiriqui.

180. *ONCIDIUM ANOMALUM* Rehb. fl. Linn. XXII. 845. (1848.) Cf. Walp. Ann. III. 557. Lindl. Fol. p. 51. sub 180. false proposito nomine Lindleyano *Oncid. panchrysi*;

A very pretty species with small pure yellow flowers in a close pyramidal panicle, all the green parts covered with a delicate bloom, wherefore I once gave a specimen

from Mr. Linden the name of *O. glaucescens*. I have never seen the crest in the state described in the „*Linnaea*;" but have invariably found it to consist of a central three or four-toothed ridge, with a pair of elevated lines in front, and a few free warts on either side.

Wild in New-Granada; province of Pamplona, at 8000 ft. — Funck and Schlim, 1432; province of Ocanna and Sota, at 7500 ft. — Schlim, 1018; Socorro—Linden, 123.

Rchb. fil. Bonpl. II. 279 :

Diese Art bietet eine obenhin so zarte Inflorescenz, dass man sie bequem mit der des *Oncidium ornithorrhynchum* vergleichen kann. An der Stelle der in der *Linnaea* beschriebenen Schwielen steht bisweilen eine einzige flachgedrückte vorn zweizählige Schwiele. Häufig findet man zwei lappige parallele Schwielen und darum herum einige warzige Buckel. — Neu-Granada: Provinz Pamplona. „La Baja.“ 8000'. Januar 1849. Nr. 1184. Schlim.

Lindl. in Journ. H. S. IV. 267. 1849. c. xyl. *Oncidium panchrysum* Lindl.

Foliis brevibus ensiformibus, obtusis strictis paniculae patulae pedunculo aequalibus, sepalis ovatis acutis planis liberis, petalis conformibus subundulatis, labelli trilobi lobis lateralibus rotundatis crispis basi pubescentibus, intermedio bilobo rotundato fere aequilatis, crista plana apice subquadriloba verruculis quibusdam sparsis utrinque, columna aptera.

New-Granada. Socorro. Lindl. Herb. 1432.

A small species with an erect branching panicle of pure yellow flowers. From the roots to the top of the panicle is not much than a foot, even in the wild specimens. The leaves are about 6 inches long, erect, obtuse and as high as the patch of the panicle. Among the peculiarities of the plant is the presence of two little patches of fine down at the very base of the lip where it comes in contact with the column. I have received flowers from various anonymous correspondents. It belongs to a group of which the well known *O. pulvinatum* may be taken as the representent.

481. *ONCIDIUM AURIFERUM* Rchb. fil. in *Linnaea* XXII. 847. Bonplandia Ap. I, 1854. L. F. p. 57:

Very like *O. panchrysum*, from which its great column-wings distinguish it. Its flowers are not whole-coloured, but marked with brown even on the lip.

Wild in New-Granada; Merida, at 7000 ft. — Funck and Schlim; Wagener.

Cf. Walp. Ann. III. 558. — Rchb. fil. Bonpl. II. 13. l. c.:

Merida 7000'. Diese Art hat ein höchst eigenthümliches Aussehen. Die Hüllblätter scheinen grüngelb, sie sind kurz und auf der untern Hälfte querbandirt. Die gegenförmige hochgelbe Lippe ist vorn breiter als am Grunde, und daselbst sehr ungleich, 2—3lappig, auch 4lappig, mit 2 grossen Aussenlappen und 2 kleinen spitzzungigen Innenlappen. Der hintere breite Theil hat Purpurflecken und einen mehr oder weniger kerbzähligen Rand. Die Schwielen am Grunde scheinen veränderlich, gewöhnlich findet man einen breiten Kiel vom Säulenfusse an bis zur Lippenmitte, zweimal gibt er nachdem divergirende Schenkel ab. In der Mittellinie läuft oft eine feine Leiste. Einige zerstreute Buckel liegen gewöhnlich regellos herum auf der Platte. Höchst charakteristisch scheint aber eine Eigenthümlichkeit, die ich früher gänzlich übersah; beiderseits gegen den Grund findet sich eine kleine runde Stelle, welche rauh ist, wie ein Reibeisen. Die Säule ist am Grunde ganz dünn, etwas nach hinten gebogen; die unternarbigten Leisten hören über dem Grunde auf. Die Flügel sind beilförmig, am Aussenrand breiter, oben und unten spitzceckig, vorn oft gezähnel. Das flügellose *O. panchrysum* Lindl. ist sehr ähnlich. Wagener.

482. *ONCIDIUM ARMILLARE* L. F. p. 51:

O. habitu omnino O. auriferi, floribus majoribus, sepalis petalisque lanceolatis acuminatis, cristae carinis 3 flexuosis antice in dente valido evanescentibus verruculis circumstantibus.

Another form, extremely like that of *panchrysum*, but with the column-wings of *auriferum*. Than the latter the flowers are larger, the sepals and petals lanceolate acuminate, not linear and obtuse with a point, and the crest has three deep wavy keels, each terminating in front in a strong upright tooth. Two other teeth of the same form and size rise in front of these, and about four emarginate warts form a curve on each side.

Wild in Peru — W. Lobb.

183. *ONCIDIUM FOVEATUM* L.f. p. 52:

O. habitu O. panchrysi, sed floribus duplo majoribus intense luteis cinnamomeo fasciatis, labelli lobo medio maximo basi auricularum loco circulari, crista basi foveata antice bicruri verruculis pluribus interjectis et circumstantibus, columnae alis dimidiatis acuminatis cordatis medio emarginatis.

From the three preceding, of which it has the habit, this is immediately distinguished by its large bright yellow flowers banded with brown, peculiar column-wings which might rather be called column-ears, and the form and crest of the lip.

Wild in Peru; sources of the Marañon—Warszewicz.

184. *ONCIDIUM RUPESTRE* Lindl. in Plant. Hartw. 151. L. F. p. 52:

(B.) *Skinneri*. Lip apiculate, Bracts adpressed.

O. Skinneri Lindl. in Gard. Chron. 1855. p. 629.

Wild in Peru; on walls and rocks in and about Loxa-Hartweg.

A very stout species, with leaves ten to fifteen inches long and two broad, and a stiff pyramidal panicle two feet high and a foot wide. The plant I have called *O. Skinneri* should, I think, upon final consideration, be regarded as a variety, with close pressed bracts, and an apiculate lip. The other differences which were supposed to exist are probably referable to the different condition of the dried and recent specimens. It is a very fine plant. The branches of the panicle are covered by a most delicate bloom. The flowers, as large as the largest form of *O. ampliatum*, are a brilliant golden yellow with about three cinnamon blotches at the base of each division, and a stain of the same colour across the lip immediately below the crest and at the base of each division, and a stain of the same colour across the lip immediately below the crest and at the base of its side lobes. The numerous sinuosities of the crest are white.

Lindl. Plant. Hartweg. l. c. 1844 Decbr.:

Pseudobulbis ovatis compressis, foliis oblongo ligulatis erectis scapo rigido brachiatis paniculato brevioribus, bracteis lineari-lanceolatis pedicellis subaequalibus, sepalis liberis concavis obtusis, petalis subaequalibus obovatis undulatis, labelli lobis lateralibus parvis sagittatis, rotundatis, intermedio bilobo, crista verrucosa corrugata linea brevielevata in fronte verrucisque quibusdam sparsim utrinque, columnae alis maximis rotundatis.

Scapus bipedalis et ultra. Flores magni, speciosi. *O. picto* proximum.

In rupis et muros prope Loxa.

Oncid. Skinneri Lindl. Gart. Chron. 1855. p. 629:

O. (verrucituberculata) pseudobulbis ovatis ancipilibus obsolete carinatis, folio oblongo-lanceolato 6-complicato apiculato subtus glaucescente scapo ipso valido ter brevior, panicula glauca aperta rigida ramis adscendentibus simplicibus 5—6-floris, dimidia inferiore nuda, bracteis lineari-lanceolatis herbaceis arclissime appressis, sepalis obovato-oblongis acutis dorsali erecto, lateralibus recurvis petalis paulo latioribus crispioribus reflexis, labelli lobo medio oblato apiculato subsessili, lateralibus angustioribus rotundatis convexis, crista corrugata inordi-

natum multituberculata dente duplici inaequaliter trilobo a fronte altero saepius emarginato segregato utrinque alis semiovatis denticulatis acutis buccis 2 prominentibus, rostello mutico.

F. 9—10 poll. Scapus ultra 2-pedalis. Flores amplitudine *O. ampliati* et majores. Proximum *O. Batemanniano*, sed differt corollae et cristae forma et colore.

Floruit in horto Horticult. Soc. — A Skinner receptum.

184. *ONCIDIUM BATEMANNIANUM* „Knowl. and Westc. Fl. Cab. III, 183. t. 137.“ L. F. p. 52. Falsa auct. pro „Parmentier“:

(A.) *spilopterum*. Flowers racemose. Sepals and petals green outside, red inside; middle front tooth of the crest much larger than the others.

O. spilopterum Lindl. in Bot. Reg. 1844. Misc. 76. 1845. t. 40.

O. gallopavinum Morren in Ann. Gand. 1. 13.

(B.) *ramosum*. Flowers in a very large panicle. Brilliant yellow, with the sepals and petals banded with rich chocolate.

O. ramosum Lindl. in B. R. sub fol. 1920.

O. Pinellianum Hort. Soc. Journ. Jan. 1848. c. ic. xyl.

A tall dense erect branching panicle belongs to this, which has the lower sepals much narrower than the petals, which are rather broader than the dorsal one. Its crest consists of three to five short plates at the base, and three others in front, diverging and irregularly lobed; around which are several other processes, besides a few varicosities towards the edge of the lip. It was formerly cultivated by Mr. Barker, who called it *O. anomalum*, because its flowering stem grew from the apex of the pseudobulb. Flowers large, brilliant yellow, with the isthmus of the lip and the sepals and petals blotched with the richest chocolate in one variety, and dull red, green outside, in another. A very fine and complete specimen in my herbarium shows how variable the flowers are in size, some on the same panicle being hardly half an inch across, while others are more than an inch. It has evidently a tendency to pass into the dimorphous state. After the most careful examination of the original evidence, I can come to no other conclusion than that all the supposed species, now reduced to one, are mere forms of one another. I also fear that *O. caldense* (n. 171) must be reduced to this. That all are Brazilian is unquestionable; and yet it is asserted in gardens that some come from Mexico. Rehb. refers *O. stenopetalum* of Klotzsch to this species.

Wild in Brazil; Itacolomi, near Villa Rica, in the province of Mines—Martius.

Oncidium spilopterum Lindl. B. R. XXX. (1840). Misc. 76. XXXI. (1845.) tab. 40:

Pseudobulbis compressis oblongis diphyllis, foliis erectis oblongis scapo erecto racemoso brevioribus, sepalis ovatis acutis liberis, petalis conformibus latioribus, labello maximo trilobo subrotundo emarginato apiculato lobis lateralibus nanis obtusis, crista antice triloba jugis quibusdam verrucisque utrinque pone basin quasi 5-loba, columnae alis semicordatis crenulatis, maculatis.

Peculiar habit. Loddiges imp. e Brasilia. Its flowers are large and yellow with small brownish purple sepals and petals. The base of the labellum is the same colour, while the wings of the column are clear yellow, spotted with crimson. The flowers grow in an erect raceme longer than the leaves. It may be stationed between *O. Lanceanum* and *Carthaginense*.

Oncidium gallopavinum Morr. Annal. soc. 209. d'Agric. and Bot. Gand. Journ. d'Hort. 1845. N. 1. F. 1:

Pseudobulbis ovatis apice attenuatis; foliis binis, planis, lanceolatis, scapo elongato, spica simplici, 7—10 floribus divaricatis, bracteis minimis, ovato lanceolatis, acutis, membranaceis, sepalis liberis, ovatis, undulato concavis, roseo purpureis; petalis ovato lanceolatis roseo purpureis, labelli lobis lateralibus spatulatis, abbreviatis, rubris, intermedio

maximo, clongato, emarginato, obcordato, sinu brevi mucronato, citrino, crista minima, vix bicallosa, tuberculis maximis, rugoso carunculatis, purpureis, columnae auriculis alato explanatis, latis.

Mexico imp. Verschaffelt.

Lindl. B. R. XXXI. 1845. Misc. 46: Morrens figure is so very inexact in its details, that we cannot form any opinion upon it.

Huc: *Oncidium Batemannianum* Parmentier Mss. in Floral Cab. III. (1840) N. 37:

Pseudobulbis ovato-oblongis, compressis, glabris, vix ancipilibus, foliis coriaceis, oblongo ensiformibus, carinatis, acutis, striatis, obverse maculatis, scapo erecto, longissimo, apice ramoso, sepalis lanceolatis, marginato-unguiculatis, supremo arcuato, undulato, lateralibus longioribus marginibus revolutis, petalis spathulatis, valde undulatis, labelli lobis lateralibus nanis, rotundatis, undulatis; intermedio magno, reniformi, apice emarginato; crista carunculis numerosis obsita; columnae alis subrotundatis undulatis.

Perigonii phylla rubra, labellum flavum, basi purpureo striolatum et carunculatum.

Huc: *Oncidium ramosum* Lindl. B. R. XXIII. (1837.) sub 1920:

Pseudobulbis —, foliis ensiformibus, panícula densa ramosa, sepalis angustis acutis, supremo erecto fornicato, lateralibus unguiculatis angustioribus, crista digitato tuberculato squamis $\frac{3}{2}$ carnosis interjectis, columnae alis integerrimis. — Brazil. Von Martius.

Scape a foot and half long, much branched, very compact, not at all flexuose. Flowers extremely numerous, yellow and olive, rather smaller than those of *atissimum*. A beautiful species.

Huc Sert. sub 48: „*Pseudobulbis* ovatis polyphyllis, foliis ensiformibus, acutis, scapo apice ramosissimo paniculato, petalis oblongis subundulatis, labello subrotundo bilobo basi auriculato, cristae tuberculis 5—crenatis obtusis, columnae alis rotundis integerrimis.

Pale yellow flowers in a branched panicle upon a scape 5 feet high. In its native state the inflorescence is very large. Several fingerlike streaks of brown radiate from the base of the tuberculated crest, whose elevations are disposed in two tiers, the upper consisting of 5 short wavy ridges and the lower of two with a truncated 4 lobed tubercle between them. I do not see, how *O. Batemanni* differs so far as the fig. and description enable me to judge; nothing is said of the native country of that plant.

Bot. Reg. XXVI. 1840. Misc. 154:

A very fine species, which has flowered with Mssrs. Loddiges imported from Gongo Soco in Brazil. It has gay pale flowers in a branched panicle already a foot square, upon a scape 5' high, and in its native state the inflorescence is much larger. Several finger-like streaks of brown radiate from the base of the tuberculated crest, whose elevations are disposed in two tiers the upper consisting of five short wavy ridges, and the lower of two, with a truncated fourlobed tubercle between them.

Huc: *Oncidium Pinellianum* Lindl. Journ. H. Soc. III. 1848. p. XVI:

Flowers very bright yellow, with dark brown blotches and spots on the sepals, petals and base of the lip, in the amount of blotching there is however some variety in different individuals. They appear closely packed in a second manner upon the short branches of a small panicle as is shown in the cut, where 1 represents the column and wings magnified and 2 a flower from which the column and upper half of the lip have been removed. The species is very near *O. spilopterum* (also called *O. gallopavinum*) from which it differs in having a branched panicle, sepals and petals larger in proportion to the lip and a crest more broken by at the base into short parallel plates. I am not sufficiently acquainted with the plant to judge it further.

Oncidium stenopetalum Kl. Allg. Gtz. 1855. p. 273:

Pseudobulbis ovato elongatis, apice attenuatis compressiusculis leniter striatis diphyllis, basi trifoliatis; foliis longis angustis erectis lineari-lanceolatis acuminatis, dorso leviter carinatis; racemo basilari longissime pedunculato simplici teretiusculo viridi erecto 20—24 floro; bracteis lanceolatis acuminatis viridibus, inferioribus sterilibus amplexicaulibus distantibus; perigonii foliolis viridi-flavescentibus fuscescentifasciatis acutis, exterioribus angustissimis distinctis involutis, lateralibus geniculato-divaricatis, interioribus utrinque attenuatis, latioribus undulato-crispatis; labello trilobo reniformi emarginato, margine undulato, supra aureo, subtus rubro-punctato, lobis lateralibus obovatis subrecurvis, disco rubro-maculato, versus marginem in quoque latere bi-tridentato, medio glabro cristato; crista trilamellata, lamella media elevata crenata, lateralibus interruptis obtuse cornigeris; gymnostemio flavido, dorso bimaculato; alis flavidis brevibus, apice dilatato-truncatis obsolete crenatis.

186. ONCIDIUM ABORTIVUM Rehb. fl. in Linnaea XXII. 847. L. F. p. 53:

Flowers panicled, for the most part abortive, of a very thin texture. Sepals and petals, which are broader, very acute. Lip equally three-lobed, the middle lobe acute, Crest many-fingered. Column-wings ligulate, recurved, denticulate at the end. Stigma rostrate.

Wild in the Caracas—Wagener, Moritz.

Walp. Ann. III. 558. — Rehb. fl. Bonpl. II. 12. Herr Moritz hatte nur ein paar Exemplare gesammelt; auch Herr Wagener versichert, diese eben so schöne, als lehrreiche Art in Caracas auf allen seinen Streifzügen ein einziges Mal gesehen zu haben. Caracas. Wagener.

187. *ONCIDIUM HETERANTHUM* Pöppig und Endl. N. G. and Sp. I. 34. t. 60. L. F. 53:

What I take to be this plant has a long drooping panicle, with compound flexuose divaricating branches about two inches long at the longest. The column-wings are coarsely serrated. The crest consists of nine to eleven blunt equal teeth, forming a narrow line thus

$$\begin{array}{c} 2 \\ 3 \\ 2 \text{ or } 4 \\ 2 \end{array}$$

Wild in Peru; on trees near Pampayaco—Pöppig; Mathews 1917.

Lindl. Sert. sub 48:

Scapi paniculati ramis racemosis divaricatis, floribus sterilibus astylis minutis, perfectorum sepalis oblongo spathulatis planis, labello quadrangulati apice lateribusque emarginato, crista multituberculata, columnae alis ultra medium decurrentibus magnis semisagittatis serratis, anthera rostrata.

Peru.

Leaves about 3, small narrow, on slender pseudobulbs. Panicle 1½' long. Flowers apparently yellow. Remarkable for a mixture of perfect and sterile flowers on the same branches. Details of Pöppig fig. very faulty.

188. *ONCIDIUM CHRYSOMORPHUM* Lindl. in Bot. Mag. ined. L. F. p. 54:

O. foliis loratis obtusis, panicula pyramidali heterantha ramis recurvantibus flexuosis basi spathaceis, sepalis petalisque obovatis obtusis reflexis, labelli basi latioris apice bilobi isthmo oblongo lobis imbricantibus, crista 3-carinata utrinque versus basin crenata callo crenato utrinque adstante, columna fere aptera basi plana elevata.

Leaves like those of *panchrysum*, but broader and stouter. Panicle rather taller, about a foot high, with a stiff peduncle clothed with three or four spathaceous sheaths, and similar conspicuous bracts at the base of each branch; quite erect, every division flexuose, with the lateral branches curving downwards. Flowers pure golden yellow, with paler ends, the size of *O. panchrysum*, with remarkably obtuse sepals and petals.

Wild in the Caraccas; Santa Martha—Purdie.

189. *ONCIDIUM ORNITHORHYNCHUM* HBK. LO. 204. Bateman Orch. Mex. t. 4. Bot. Reg. 1840. t. 10. B. M. t. 3912. L. F. p. 54:

This well-known plant, remarkable for its clear rose-coloured flowers, with scarcely a tinge of yellow, in a genus so very generally of that colour, varies much in the size and tint of their parts. In some states the flowers are large and deep-coloured; in others they are small, pallid, and unattractive. It naturally inhabits shady damp places, where the temperature varies between 68° and 75°.

Wild in Mexico; llano verde — Hartweg; Mechoacan — Humb. and Bonpl.; Oaxaca—Galeotti, 5019; Vera Cruz—Linden 195; Guatemala—Skinner; Peru; woods near Pasto—Jamieson in hb. Hooker.

Lindl. Bot. Reg. l. c.:

Pseudobulbis ovatis diphyllis, foliis ensiformibus, recurvis, scapo paniculato brevioribus, sepalis lineari-oblongis undulatis, reflexis, omnino liberis; labelli panduriformis lobis lateralibus acutis intermedio bilobo, crista e lamellis 5 crenatis apice rostratis constante, columnae alis cuneatis dentatis, stigmatate longirostrato.

Humb. Bonpl. and Kunth n. g. et sp. plant. I. 345. t. 80. (in the coloured copies yellow!) — *O. roseum* Hort.

Skinner found it in Guatemala. Odour = agreeable new hay according to Bateman. Humboldt found it 6000 above the sea.

Floral Cab. III. 1840. Tab. 136.

190. *ONCIDIUM TRULLIFERUM* Lindl. in B. R. 1839. t. 57. L. F. 54:

Panicle short, with a few densely-flowered drooping branches springing from coarse spathaceous bracts. The petals are wider than the sepals, but not much. The crest requires to be re-examined in a fresh state. When dried it loses all form. The stigma is rostrate. Flower yellow and brown.

Wild in Brazil; Pedro Bonito—Miers.

Lindl. l. c.:

Pseudobulbis elongatis ovalibus compressis, 2—3-phyllis, foliis ovalibus fere aequalibus, scapo radicali rigido semel ramoso, sepalis lateralibus distinctis superioribus petalisque concavis, obtusis, labelli lobis lateralibus nanis rotundatis, intermedio trulliformi serrulato, crista verrucosa medio depresso laevi antice dente ascendente serrato apice appendiculato, columnae alis integerrimis ovatis obtusis.

Perigonium flavum, rubro notatum. Brazil. Loddiges. Small close panicle.

191. *ONCIDIUM PHYMATOCHEILUM* Lindl. in Paxton's Fl. Gard. nr. 123, ic. sub t. 18. L. F. p. 54:

The native country of this beautiful thing is unknown. Prof. Rehb. who, like myself, has seen no wild specimen, informs me, that the Hamburg gardeners are unanimous in asserting that it came from Brazil. In this country it is reputed Mexican. Its long linear-lanceolate green sepals, banded with brown, remind one of *Brassia*; while its ivory lip and column just stained with yellow near the base, is that of genuine *Oncidium*.

Wild in ———.

Paxt. Fl. G. I. p. 78. Nr. 121:

Racemo subpaniculato, sepalis linearibus acuminatis apice recurvis, lateralibus longissimis, labelli auriculis convexis dilatatis crenatis, lobo intermedio unguiculato ovato acuminato, basi multituberculato, columnae alis semicordatis acuminatis.

Flowers greenish, lip snowwhite. Erect, 2 edged pseudobulbs tinged with purple, surrounded by scales, which when young are olive green spotted with crimson. Leaves thin, linear lanceolate oblong. Flowers have appearance of some *Brassia*. Lip white with yellow tubercles and a few yellow stains.

Mexico. Ic. Xyl. ibid. p. 88. — G. Chr. 1848. 139. — *Pescatorea* t. 53.

193. *ONCIDIUM OCHMATOCHILUM* Rehb. fl. in Bot. Ztg. 1852. p. 698. L. F. 55:

This is described with olive-green flowers, flecked with golden. Lip white, with brown and violet flecks and bands. Its affinity is undoubtedly with *O. phymatochilum*; but its lateral sepals are connate at the base, and its petals are three times as wide; on which account it would rather seem referable to the Tetrapetalous macropetalous group (see p. 17). My specimen, for which I am indebted to Prof. G. Reichenbach, is a portion of a long zigzag panicle, the bracts of which are almost obsolete. The flowers are much smaller than in *O. phymatochilum*, and apparently of a firmer texture. The lateral sepals are linear-lanceolate, canaliculate, united for about a quarter their length, and longer than the other parts. The dorsal sepal and petals are alike lanceolate acuminate and recurved as well as channelled at the end; but the latter are at least twice as wide. The lip is hastate with the lateral lobes rounded, passing into an inversely cuneate isthmus which expands into an ovate lobe, much narrower than the base. The crest consists of six thick short plates, the middle basal one of which has a slightly elevated crest. The column has a pair of very prominent narrow cheeks; its wings are reduced to a pair of pointed rudiments opposite the base of the stigmatic cavity. It would seem to be a very pretty plant when fresh.

Wild in Veragua; Chiriqui—Warszewicz.

Rehb. l. c.:

Panicula flexuosa, diffusissima, perigonii phyllo summo ligulato, acuto, ph. lateralibus externis subaequalibus, acuminatis, basi ima unguiculato connatis, illo tertia parte longioribus, ph. lateralibus internis oblongis acuminatis, prope triplo latioribus, supremo aequilongis, apice recurvis, labello basi lato, marginibus posticis rectis, utrinque auriculato, dein sensim angustius cuneato, antice in laminam reniformem, acutam apice recurvam dilatato, callo basilari erectiusculo, dorso carinato, utrinque biauriculato, gynostemii gracilis utrinque pone foveam angustissime alati alis subintegris, infra utrinque minute auriculato.

Blüthen olivengrün und gelb gefleckt. „Lippe weiss, mit braunen und violetten Flecken und Bändern.“ Das verwandte *O. phymatochilum* Lindl. hat dreieckige, oben spitze, grosse Flügel. *O. nigratum* hat gleichlange Hüllblätter. *O. trulliferum* dazu eine vielbucklige Lippe.

194. *ONCIDIUM RANIFERUM* Lindl. in B. R. sub t. 1920. 1838. t. 48. B. M. t. 3712. L. F. p. 55:

The flowers are too diminutive to render this useful to cultivators; they are wholly yellow, except the crest and base of the lip, which are reddish-brown. Sometimes the panicle becomes leafy, with a few scattered flowers only at the end of its branches.

Wild in Brazil; Organ mountains—Gardner 637.

B. R. l. c. sub t. 1920: 3

Pseudobulbis ovatis sulcatis diphyllis, foliis lato-linearibus acutis scapo paniculato brevioribus, sepalis petalisque oblongis acutis patulis, labelli laciniis lateralibus triangulis, intermedia cuneata emarginata, crista depressa medio constricta, dimidio posteriore quadrata basi utrinque callosa medio tuberculata anteriore triangulari, apice emarginata utrinque foveata, alis columnae integris. — Brazil.

A smallflowered species with the lower half of the lip chesnut coloured; it exists in Mr. Knight's coll.

Bot. Reg. (XXIV) 48: native of Brazil. Mr. Descourtilz met with it in damp forests near Bananal. This traveller observed, that it fixes itself to branches not exceeding 12 feet in distance from the earth. — Var. major Hook. B. Mag. 3712.

195. *ONCIDIUM WENTWORTHIANUM* Batem. in Bot. Reg. 1840. Misc. 194. Paxtons Fl. Gard. II., ic. 127. L. F. p. 55:

There are two varieties in cultivation, of which one, sent me by Sir Philip Egerton, has brilliant yellow flowers much larger than in the original, and barred with the richest possible brown.

Wild in Guatemala—Skinner; mountains of Santa Rosa, in May—Hartweg.

B. R. XXVI. (1840.) Misc. 194:

Pseudobulbis nebulosis oblongis compressis ancipitibus diphyllis, panicle angusta elongata ramulis 3-floris, sepalis liberis petalisque oblongo lanceolatis acutis, labelli cordati laciniis lateralibus rotundatis grosse crenatis intermedia multo brevioribus, intermediae ungue basi lato apice angustiore lateribus rectis lamina reniformi denticulata basi ipsa labelli duplo angustiore, crista 5-dentata denticulis 2 anticis aucta, columnae alis erosis brevibus.

Approaches *O. Baueri* and *altissimum*, but the flowers are very differently shaped, and richly stained with crimson upon a yellow ground.

„Is much used in adorning altars.“ Skinner.

The beautifully mottled pseudobulbs at once distinguish it from every other species; it has flowered here, and I have had it drawn. In habit it is never $\frac{1}{2}$ the size of *O. Baueri* and *altissimum*, though it rivals them in the length of its stems; neither does it ever form compound lateral branches from the spike.

In complim. to Lord Fitzwilliam. Bateman O. Mex. 39. 1842. — Lindl. in Benth. Pl. Hartw. p. 94: Santa Rosa Mexici Hartweg!

196. *ONCIDIUM PERGAMENEUM* Lindl. in Benth. Pl. Hartw. p. 93. B. R. 1842. Misc. 7. L. F. p. 55:

To the pseudobulbs and leaves of *O. tenue* this almost adds the flowers of *Wentworthianum*, with the same broad base of the lip and similar spotting. The crest is formed by a heap of about nine short stumpy tubercles. The inflorescence is that of *O. suave*.

Wild in Guatemala; montana en medio. Aug.—Hartweg.

Lindl. Benth. Pl. Hartw. l. c.:

Pseudobulbis ancipitibus lucidis costatis diphyllis, foliis patentibus pergamensis oblongis acutis undulatis, panicle longissima divaricata, sepalis liberis petalisque lanceolatis acuminatis patentissimis, labello trilobo basi latiore, laciniis lateralibus cordatis undulatis medio subemarginatis, intermedia emarginata apiculata paullo latiore quam longa, cristae tuberculis 5 parallelis linearibus undulatis subpubescentibus, columnae alis triangularibus acutis.

Mexico. Hartweg.

Bot. Reg. XXVIII. 1842. Misc. 7:

Leaves 5—6" long, $1\frac{1}{2}$ —2 wide, of a thin parchment like texture. Panicle weak, loose, 2—3" long, much appearance of *O. Baueri*. Sepals and petals wavy and brown tipped with yellow, lip yellow except a dull brown stain on each side of the base of the middle lobe. The lip is in form like that of *O. Wentworthianum*, that is to say, it is broader at the base than the apex, which is transversely oblong, with a small point in front. The wings of the column are small, short, and curved like a bird's bill with a few obscure toothings on the upper edge.

Lindl. Sert. sub 48:

Very thin pseudobulbs, sharp edged and somewhat furrowed on each side. Leaves in pairs, from 5—6" long by one, and $\frac{1}{2}$ —2 inches wide, of a thin parchment like texture, oblong, narrowing down to their base and sharp pointed. The flowers are in a weak loose panicle, about 2—3" long, have much the appearance of *O. Baueri*. Sepals and petals narrow, sharp pointed, every brown tipped with yellow; lip is a dull yellow; except a dull brown on each side of the base of the middle lobe. Lip in form like that of *O. Wentworthianum*, that is to say it is broader at the base than the apex, which is transversely oblong, with a small point in front. Wings of the column are small, short curved like a bird's bill, with a few obscure toothings on the upper edge.

§. 14. *Glanduligera*. L. F. 56.

* It is difficult to find a satisfactory place for *O. Papilio*; and now that a second species is known, equally furnished with petals and dorsal sepal much longer than the laterals, it seems desirable to associate them in one small group quite apart from the others.

197. *ONCIDIUM PAPILIO* L. O. 203. B. Reg. t. 940. B. M. t. 2795. B. C. t. 1086. L. F. p. 56:

(A.) Lip yellow, mottled all over with brown.

(B.) *limbatum*. Lip yellow, with a cinnamon-brown border. B. M. t. 3733. B. C. t. 1086.

(C.) *albiflorum*. Flowers white. (A specimen once found in the Caraccas, according to Rehb. fl.)

(D.) *Kramerianum* Rehb. fl. in litt. Xenia t. 33. Flowers denticulate and crisp over all their edge, bright yellow with a few brown spots.

This well-known plant is remarkable not only for its very long linear dorsal sepal and petals, but also for the singular glands which surround the antherbed. They vary somewhat in number and position; but I do not see how any distinction can be derived from their condition.

Wild in Trinidad—Woodford; Caraccas; near Merida, at the height of 4—5000 ft. on precipitous cliffs—Wagner; Dominica—Imray, in hb. Hooker, „not indigenous“; D. on Chimborazo, at 3000 ft.—Warszewicz.

Lindl. Paxt. Fl. G. I. 104:

O. pseudobulbis subrotundis compressis rugosis monophyllis, foliis oblongis coriaceis obtusis maculatis, scapo perrennante debili ancipiti articulato apice paucifloro, sepalo supremo petalisque linearibus longissimis basi angustatis, sepalis lateralibus latis revolutis undulatis, labello longioribus, labelli lacinia intermedia oblonga emarginata subrotunda crispa basi valide angustata lateralibus rotundatis, cristae glandulis formae ranae cubantis, columnae alis serratis. — Trinidad.

No resemblance to others. It probably forms a section (genus?) by itself.

Rehb. fl. Bonpl. II. 13. Caraccas. Merida. October—December. 4—5000'. Meist wächst diese Pflanze an jähren Felsabhängen, sodass die Sammler sich an Seiten herablassen müssen, um sie zu erlangen. Auch eine weissblühende Pflanze wurde einmal angetroffen. Wagener.

197 b. *ONCIDIUM KRAMERIANUM* Rehb. fl. Xenia I. p. 80. t. 33:

Aff. *Oncidio Papiloni* Lindl. minus, pseudobulbis obtusis quadri—septangulatis (nec ancipilibus), pedunculi internodiis omnibus teretibus, labello et sepalis lateralibus serrulatis, illo antice crispissimo, carina basilari obtusangula crenata, alis gynostemii inferioribus integerrimis.

Pseudobulbus rotundulus, viridiviolaceus, obtuse quadri—septemangulatus, angulis obtusis. Folium cuneato oblongum acutum valde coriaceum, obscure viride, maculis striolisque atrovioleaceis; usque octo pollices longum, supra medium quatuorve latum. Pedunculus more *Oncidii Papilonis* Lindl. perennis, raro superne ramosus ex axillis vaginarum praesertim laeso internodio supremo. Internodia omnia — et suprema quidem haud minus — teretiuscula, nec ancipitia more *Oncidii Papilonis* Lindl. Vaginae appressae apice acuminatae acutaeve. Bractee subaequales. Perigonium tenuissimum, membranaceum, telae *Dendrobii Palpebrae* similiumque plantarum, vix per duos dies bene servatum, flore *Oncidii Papilonis*, bene culti duabus tertiis minus. Sepalum dorsale et tepala linearia ante apicem acutum paulo dilatata et undulata; brunnea basi flava; ascendentia. Sepala lateralibus cuneata ligulata acuta margine minute serrulata, crispa nunc lobulata flaveola maculis brunneis. Labellum (an semper?) per longitudinem complicatum, a basi cordata panduratum, antice valde dilatatum, crispulobulatum, margine denticulato serrulatum; carina baseos obtusangula, lateribus papulosa, vertice crenata; flaveolum brunneo maculatum disco antice unicolori. Gynostemii alae superiores lineares apice capitatae, alae inferiores obtuse quadratae integerrimae. Pollinia sessilia in lamina semilunata brevissima (quam in *O. Papilione* bis seu ter breviori).

Chimborasso v. Warscewicz.

198. *ONCIDIUM LIMMINGHII* E. Morren f. in litt. L. F. p. 56:

O. sepalis dorsalis petalisque lanceolatis inferioribus quadruplo majoribus, labelli basi latioris auriculis rotundatis isthmo obtusato elongato in laminam subrotundo-reniformem expanso, crista . . . , columnae alis 4 laceris fimbriatis, 2 lateralibus angustioribus, 2 apicularibus inflexis.

For this very curious plant I am indebted to Mr. Edward Morren of Liège, who has named it after Count Alfred Limminghe, a distinguished Orchidophilist. M. Morren informs me, that it was sent to Belgium, it is believed, from the Caraccas, by Mr. Van Lansberghe, consul for the Netherlands. It has entirely the aspect, at first sight, of *O. Papilio* on a very small scale. Pseudobulbs roundish, compressed, wrinkled, about three quarters of an inch long. Leaf solitary, little more than an inch across. Peduncle filiform, terete, between four and five inches long, with three membranous close-pressed acute sheaths. The sepals and petals appear to be dull olive-green; the lip the same colour, but paler. The structure of the crest cannot be determined without destroying my solitary flower.

Wild in the Caraccas—Edward Morren.

Species insufficiently known L. F. 57.

Oncidium funereum Llave L. O. p. 201:

Pseudobulbis subrotundis depressis hyalino-virescentibus diphyllis, foliis lanceolatis spithamaeis, scapo tenuissimo simplici elongato, sepalis petalisque aequalibus patulis apice reflexis, labello carnoso convexo emarginato, cristae tuberculis variis denticulisque.

Mexico.

Known only from the description of La Llave. It is said to be used by the people of Mechoacan as an ornament of their tombs. The lip is described as yellow, the segments of the flower as olive-brown spotted. The leaves are a span long.

„*O. filipes?*“ Rehb.

Oncidium olivaceum H. B. K. L. O. p. 202:

Bulbo ovato-oblongo, foliis oblongo-lanceolatis, pedunculo simplici multifloro, foliis calycis carnosus reflexis, labello trifido, lacinia intermedia subreniformi emarginata, gynostemio basi alis rotundatis instructo, apice cucullato.

Popayan.

Leaves three or four inches long. Scape one to two feet high. Petals oblong-nute, shorter than the sepals. Lip very large, with the middle lobe crenulated, fleshy pink, an inch broad, narrowed at the base, with a conical yellow crest; the lateral lobes obliquely ovate, wavy, distinct, spotted with red, from four to five lines long.

„*Oncid. cucullatum?*“ Rehb.

Oncid. emarginatum Meyer L. O. p. 206:

Foliis lanceolato-linearibus obtusis emarginatis, floribus terminalibus, labello obovato integerrimo, gynostemii alis ovato subrotundis.

Essequibo.

Caules spithamaei, sulcati. Folia 2—2½ poll. longa. Flores parvi, purpurei, punctis argenteis notati. Sepala oblongo-acuminata, inferiora 2 paululum breviora, acuta. Labellum obovatum, basi attenuatum, integerrimum, planum, supra tuberculis rugaeformibus notatum. Columna brevis, apice alis 2 parvis, patenti erectis, rotundatis instructa.

Obs. Est *Epidendrum stenopetalum* Hook! Rehb.

Oncidium rariflorum Ach, Richard in Ann. Sc. Jan. 1845:

Pumilum, pseudobulbis ovoideis compressis, 1-phyllis; folio lanceolato acuto; scapo radicali 2-floro; gynostemio bialato; labello trilobo, lobo medio obcordato.

Mexico.

Oncid. brevifolium A. Richard l. c.:

Pseudobulbis ovoideis 2-phyllis, foliis ellipticis acutis coriaceis, brevibus; scapo paniculato, subsimplici, floribus luteis maculatis: labelli lobis lateralibus angustis, intermedio orbiculari bifido.

Mexico.

Oncidium amoenum A. Richard l. c.:

Pumilum; pseudobulbis oblongis compressis diphyllis, floribus parvulis paniculatis, sepalis oblongis, reflexis, obtusis, pallide brunneis, labello luteo trilobo, lobo medio obovato, spatulato, emarginato.

Mexico.

Oncidium Ghiesbreghtianum A. Richard l. c.:

Pseudobulbis compressis ovoideis 1 — 2-phyllis; foliis lanceolatis acutis; floribus pallide purpureis, racemo simplici, labelli lobis lateralibus obtusis, intermedio late obcordato.

Mexico.

1461. **LOCKHARTIA** Hook.

Bot. Mag. 2715.

Rchb. fl. v. Schl. Bot. Ztg. 1862. p. 766:

Ein Blick auf die Tafel XXVII. des Prodr. Peruv. belehrt mich, dass Herr Prof. Lindley und ihm folgend auch ich Unrecht hatten, die Hooker'sche Gattung Lockhartia nicht anzunehmen. Die Abbildung zeigt Blüten einer Dichaea und eines (wenn anders treu dargestellte) neuen Centropetalum, das Niemand nennen möge, ehe er nicht dazu Exemplare hat. Man würde wieder zu weit gehen, wenn man eine dieser zwei Lindley'schen Gattungen einziehen wollte. Die Gattung Fernandezia hat gar keinen Anspruch auf Fortexistenz, da sie ein heterogenes Gemenge ist. Die Arten von Lockhartia sind folgende: 1) *L. elegans* Hook. (F. e. Lindl.). 2) *L. lunifera* (F. l. Lindl.). 3) *L. acuta* (F. acuta Lindl.). 4) *L. parthenocomos* (F. parthenocomos Rchb. fl.). *Fernandezia longifolia* Lindl. übergehe ich mit Absicht. Ohne Blüten beschrieben kann sie der Autor selbst nicht wiedererkennen, da mehrere Arten dieselben Blätter und Blütenstände haben können. Man muss sie fallen lassen. — Bei Teoxomulco in Mexico wächst eine neue Art, deren Blüten ich nicht kenne; die Blätter sind ganz kurz, sehr breit und decken einander ganz dachziegeln, so dass eine Spitze auf dem Grunde des folgenden Blattes liegt.

Rchb. fl. Xenia I. p. 99: Pollinia pyriformiclavata sessilia in glandula ovata parva: quo caractere deficiente Lockhartia esset inter Oncidia, quod Aporum inter Dendrobia.

Fernandezia fl. Peruv. Lindl. Orchid. 1832—1833. 207.

Cf. tamen Prodr. Peruv. Tab. XXVII.: icones sunt Centropetali et Dichaeae, unde patet, Hookerianum genus esse praefereendum.

subito reniformis bilobi; carina obovatula a basi labelli ad medium unguem usque, ibi fasciculo dentium collecto. Gynostemii minutissimi alae quadratae excisulae.

v. Warscewicz! Xen. I. Tab. 40. 10. 11.

8. LOCKHARTIA OERSTEDII Rehb. fil. Xen. I. p. 100:

Lobo medio ligulato apice cuneato dilatato bilobo.

L. ? *Oerstedii* Rehb. fil. in v. M. und v. Schl. B. Z. 767.

Xen. I. p. 105: Caules erecti usque octopollicares. Folia triangula apice obtuse retusa. Pedunculi pauciflori racemosi abbreviati. Bractee oblongae acutae cucullatae hyalinae ovariis pedicellatis multo breviores. Sepala ovata obtuse acuta. Tepala subaequalia. Labelli lobi postici lineari ligulati obtusi basi antica semicordati; lobus medius late ligulatus apice dilatatus, bilobulus, lobulis rhombeoovatis hinc crenulatis; lamina depressa antice acuta in ima basi; calcaea prope quinqueseriatae super discum lobi medii. Gynostemium minutum; androclinii cucullus denticulatus cum alis latis lateralibus confluens (an bene visus?). Flores aurei maculis striolisque purpureis super labellum ac gynostemium.

Auf dem Vulcan Barba in Costa Rica bei 7000' Seehöhe am 7. Mai von Herrn Dr. Oersted gesammelt. — Tab. 40. III.

9. LOCKHARTIA LUNIFERA Rehb. fil. in v. Schl. B. Z. 1852. 767:

Lobo medio quadrilobo lobis lateralibus posticis obtusangulis, sinu interjecto magno, tepalis ligulatis, alis triangulis retusis quadratisve.

Fernandezia lunifera Lindl. B. R. XXV. 1839. Misc. 147.

Fernandezia robusta Klotzsch in hort. Jenisch.

Rehb. fil. Xen. I. Tab. 39. III. 8—12, und p. 103:

Caulis erectus. Folia ensiformia triangula obtusa acuta arcta. Pedunculus pauciflorus folia vix excedens. Bractee cucullato triangulae acutae. Ovarium pedicellatum bracteam longissime excedens. Sepala oblonga apiculata tandem reversa. Tepala lineari ligulata apice nunc emarginatula. Labelli lacinae posticae lineares basi antica subsemicordatae; lamina quadrilobula, lobuli postici obtuse trianguli sinu magno ab anticis profunde divisus lobulatis latioribus divisi; callus cordiformis in ima basi, squamulae plurimae per totum discum. Gynostemii alae lato triangulae apice basilari seu retuso quadratae. Color citrinus maculis purpureis super labelli discum ac in alarum basibus.

Diese Art wurde von Herrn Baron von Descourtilz nächst Bananal in Brasilien entdeckt („Epidendre anthropomorphe“), wo sie sehr gemein sein soll. Derselbe vergleicht die Büschel, die sie auf dem Bäumen bildet, mit Buchsbaum. Später blühte sie bei den Herrn Loddiges. Nach Herrn Prof. Lindley sammelte sie Herr Hofrath v. Martius um Ilheos in Wäldern. Aus Peru wurde sie in den Garten des Herrn Senator Jenisch eingeführt, cultivirt von Herrn Kramer (*Fernandezia robusta* Klotzsch.)

Huc: *Fernandezia lunifera* Lindl. l. c.:

Folliis obtusis, petalis incurvis falcatis reduplicatis obtusis emarginatis, labelli trilobi disco tuberculato laciniis infimis linearibus falcatis petalorum longitudine lateralibus nanis rotundatis intermedia dilatata biloba, columna a dorso compressa latiore quam longa, dentata, stigmatibus verticali rimaeformi.

Resembles *F. elegans* in foliage, but the flowers are thrice as large, and quite differently formed, especially as regards the great extension of a pair of supernumerary lobes situated at the base of the labell, where they stand erect like 2 curved horns. Brazil imp. Loddiges. First discov. by M. Descourtilz, who in his Mss. states that it grows upon trees, forming tufts of verdure, which from distance remind one of the box of Europe. It is exceedingly common near Bananal. From the singular form of the lip he called it *Epidendre anthropomorphe*. Dr. v. Martius also found it in woods near Ilheos.

10. LOCKHARTIA GOYAZENSIS Rehb. fl. in v. Schl. B. Z. 18552. 768:

Lobo medio quadrilobo, lobis lateralibus magis anticis; lobis mediis angustioribus, tepalis ovatis, alis angulatis superne denticulatis.

Xenia Tab. 39. H. u. p. 102:

Caulis spithamaeus; erectus. Folia ensiformia obtusata, producta, subpollicaria. Pedunculus axillaris abbreviatus, ramosulus. Bracteae oblongae acutae membranaceae nervo dorsali valde carinatae. Flores illis Lockhartiae acutae Rehb. fl. aequales. Sepala et tepala oblongo cuneata acuta, tepala magis flabellata subretusa. Labelli lobi postici lineari falcati divaricati, portio antica quadrilobata; lobuli laterales obtusanguli antici, lobus medius sinibus parvis distinctus emarginatus aequilatus linea triangula angulo antrorsa in basi, papulae plurimae per discum. Gynostemii alae obovatae superne retusae denticulatae.

Goyaz Gardner 4360!

Xen. I. p. 101: Species obscurissima et ob florum defectum non recognoscenda, igitur delenda:

Fernandezia longifolia Lindl. Orch. Lindl. p. 13:

Foliis lanceolatis acuminatis, elongatis, corymbo paucifloro sessili contracto longioribus.

A yellow flowered epiphyte from the neighbourhood of Venezuela in the province of Merida, at the height of 5000'. Jul. 1842. (N. 660.) Flower structure unknown to me."

Habemus iconem in horto Lindeniano confectam Lockhartiae cujusdam venezolanae „*Fernandezia longifolia* Lindl." dictae, quae forsitan eadem est, cujus iconem transmisit dom. Lansberg; distat inflorescentiis folia excedentibus.

1462. **PACHYPHYLLUM** H. B. Kth.

Nov. Gen. et Sp. I. 339.

1. PACHYPHYLLUM DISTICHUM Hb. B. Kth. Rehb. fl. in Bonpl. III. 219:

Aff. P. Hartwegii, vaginis vernixis transverse rugulosis, nervis non prominulis, foliis oblongis acutis microscopice denticulatis, tepalis lanceolatis acutis, labello oblongoligulato acuto utrinque obtusangulo, callo apice bilobo in disco inter utrumque lobum.

2. PACHYPHYLLUM HARTWEGII Rehb. fl. in Bonpl. III. 219:

Aff. P. disticho: vaginis nervosis opacis, foliis ovatis acutis margine microscopice denticulatis, tepalis ligulatis apice obtusato acutis, labello ligulato medio bipapulato.

Pachyphyllum distichum Lindl. Pl. Hartweg. nec Hb. B. Kth.!

Quito. Hartweg! Cf. Xenia Orchidacea.

3. PACHYPHYLLUM SERRA Rehb. fl. in Bonpl. III. 219:

Vaginis vernixis nervosis et transverse rugulosis, margine laevibus, foliis oblongis acutis complicatis margine minutissime crenulatis, tepalis cuneatoligulatis acutis, labello pandurato ligulato acuto, carinis 2 apice praeruptis elongatis utrinque in medio labello.

Peru: Chachapoyas, Matthews.

4. PACHYPHYLLUM CRYSTALLINUM Lindl. in Pl. Hartweg. p. 18. 1846:

Foliis parvis squarrosis, floribus minimis fasciculatis crystallinis, sepalis carinatis obtusis, petalis oblongis acutis serrulatis, labello anguste rhombeo laevi medio bituberculato.

„On scrubby trees of the Paramo de la Tulata, in the prov. of Merida, at the height of 10000'. Aug. Flowers yellowish". (V. 6 86. Inconsp. near *P. parvifolium*) Rchb. fil. Bonpl. II. 15; Caracas 4000'. April. Wagner.

5. *PACHYPHYLLUM PARVIFOLIUM* Lindl. Hook. p. H. 1837. CVII:

Foliis ovalibus planis, spicis subaequalibus, labello mutico.

Chachapoyas, Peru. Matthews 1836.

Hitherto only one species of this genus has been described, the *P. distichum* of the Humb. and Knth. Nov. Gen. et Sp. n. 1. t. 77., an inhabitant of Loxa and Gonzana in Peru. From that our plant is abundantly distinguished by its much slenderer stems, smaller and by no means falcate leaves, by the few (apparently constantly) 3-flowered spikes. The sepals are singularly (fig. 4!) grooved and carinated, the labellum (scarcely differing in form from the petals) is destitute of tubercles, which have been considered an essential character of the genus; but Prof. Lindley doubts whether those represented by Humboldt are not so done by mistake.

6. *PACHYPHYLLUM SQUARROSUM* Lindl. in Taylor Ann. and Mag. of Nat. Hist. Vol. XV. N. 96. Febr. 1845. p. 107:

Foliis recurvis squarrosis, labello obsolete trilobo callo a marginibus longe distante.

Popayan. (Hartweg).

Much like *P. distichum*, except in the leaves and the form and callosity of the labellum.

1463. **DICHAEA** Lindl.

Gen. et Sp. Orch. p. 208.

1. *DICHAEA GRAMINOIDES* Lindl. Orch. p. 209. Rchb. fil. Bonpl. II. 15. Caracas. Wagener. Bonpl. III. 67: Ocanna: 2000'. Wagener.

2. *DICHAEA SQUARROSA* Lindl. in Ann. Nat. Hist. 1840. IV. p. 384:

Foliis linearibus squarroso-recurvis, floribus subterminalibus, labello cymbiformi sessili apiculato, columna glabra antice unidentata.

Mexico, Hartweg.

Flowers large for the genus, apparently white. — Lindl. In Benth, Hartw. 72: in montibus Tuquila Mexici Hartweg.

3. *DICHAEA OCHRACEA* Lindl. B. Reg. XXV. 1839. Misc. 71:

Foliis linearibus acutis carinatis, pedunculis foliorum fere longitudine, bractea cucullata ovarii longitudine, sepalis petalisque oblongis acutis, labello subrotundo rhomboideo sessili, columna pilosa, clinandrio membranaceo-marginato, anthera bigibbosa.

A small Demerara plant, with narrow leaves, and pale yellow ochre-coloured flowers. It is next *D. graminoides*, which differs in having smaller flowers with very short peduncles and both shorter and flatter leaves. Messrs. Loddiges obtained it from Demerara.

4. *DICHAEA GLAUCA* Lindl. Orch. 209. Bot. Reg. XXX. 1844. Misc. 67:

This the finest of the genus, delightfully sweetscented, flowered with Messrs. Loddiges; he received it from Oaxaca, where as in other parts of Mexico, it is common. The leaves, which are placed in two rows, in an imbricated manner, are quite blue with bloom on the underside. The flowers are pure white, except a spot of yellow at the very base of each division. — Lindl. in Pl. Hartw. 72: in montibus inter Villa alta et Betecza Mexici Hartweg!

5. *DICHAEA OERSTEDII* Rehb. fl. Bonpl. III. 219:

Aff. *D. glaucae* Lindl. foliis brevioribus (sesquipollicaribus) latioribus, labelli bene unguiculati lamina oblonga utrinque ter sinuata.

Caules adsunt ultrapedales. Folia praesertim vaginas subcoeruleo pruinosas offerentia ligulatooblonga apice obtusata cum apiculo. Flores numerosi — nobis tantum ex icone Oerstediana noti. Sepala triangulolanceolata subacuta. Tepala breviora latiora. In summo monte El Viego. Oersted.

1466. **ODONTOGLOSSUM** H. B. K.

Nov. Gen. et Sp. I. 351. L. O. p. 211.

Lindl. Fol. *Odontoglossum* haec:

Sepala explanata, libera; lateralibus nunc basi connatis, nunc unguiculatis elongatis. Petala subaequalia, nunc paulo teneriora. Labellum basi cum columna parallelum eique medio adnatum, limbo deflexo, basi varie cristatum rarissime nudum. Columna clavata, saepius elongata, basi angusta nunc in membranam utrinque expansa, apice auriculata aut aptera. Stigma fovea circularis. Pollinia 2, pyriformia, solida aut postice excavata; caudicula lineari; glandula ovali. Herbae epiphytae et terrestres, Mexicanae, Peruvianae et Novogranatenses, pseudobulbosae. Folia coriacea v. papyracea. Racemi radicales 1-100-flori, aut paniculae, saepe speciosissimae.

A genus allied to *Oncidium* from which it is chiefly distinguishable by its column being long, and usually narrow at the base, or at all events not tumid there and by the base of the lip being always parallel with the face of the column. No other difference has yet been observed; but it may be added, that the lateral sepals are very rarely united. The two genera unite by *Od. naevium*, which is very like *Oncidium phymatochilum*, and by *Od. costatum* and its allies, which run into the *Oncidia microchila*. The crest is extremely variable in its composition, but it usually consists of a pair of parallel lamellae, between which arise various tumours and plates, the central one of which always really occupies the axis of the lip. In some instances, however, especially among the *Trymenia*, little or no trace is discoverable of that mode of arrangement.

Analysis of the sections.

Clinandrium nudum.

Columna cirrhata §. 1. *Euodontoglossum*.

Columna auriculata aut aptera.

Labellum manifeste unguiculatum, luteum §. 2. *Xanthoglossum*.

„ album aut roseum §. 3. *Leucoglossum*.

Labellum sessile.

Sepala lateralia parallela elongata unguiculata §. 4. *Myanthium*.

a. Labellum cordatum in apicem longum productum.

b. „ oblongum vel basi angustatum.

Sepala radiantia subaequalia; lateralibus sessilibus aut

parum unguiculatis §. 5. *Isanthium*.

a. Sepala et petala sub anthesi longe distantia.

b. „ „ imbricata.

Clinandrium cucullatum, margine membranaceo §. 6. *Trymenium*.

§. 1. *Euodontoglossum* Lindl. F. l. c. p. 2:

Columna apice alis longis acuminatis erectis aut cirrhosis instructa.

This, the original form of the genus, is readily known by the attenuation of the column-ears, which are never rounded and broad, but invariably tapered into a narrow point, which is often extended into a bristle-like appendage.

1. ODONTOGLOSSUM LINDLEYANUM Rehb. fil. Wrszw. Bonpl. II. 99:

Aff. *O. constricto* Lindl. labello linearilanceo utroque latere angulato in disco bifalcigero, basi per carinam cum gynostemio connato.

Pseudobulbi obovati compressi, folia linearilanceolata acuta pedunculos haud aequantia, pedunculi gracilenti, longiuscule articulati, apice flexuosi, racemus 3—12 florus, bractee oblongae acutae apiculatae scariosae ovaria pedicellata dimidio seu tertia parte aequantes. Flores stellati, sepala a basi anguste cuneata linearilanceolata acutoacuminata, tepala paulo latiora, sublongiora, labellum linearilanceolatum ante medium trilobum, lobi laterales obtusanguli, lobus medius anguste linearilanceus, productus; pars tertia infima carina interposita cum gynostemio connata (more *Trichopiliae*); anteposita linea callosa sulcata in basi lobi medii in cornicula ancipitia ligulata retusa, ascendente excurrente; gynostemium gracile velutinum; auriculae erectae lanceofalcatae juxta antheram conicam, vertice gibberosam antice rostratam. Blüten goldgelb mit Purpurflecken, wenig kleiner, aber in allen Theilen schmaler, als die des *Odontoglossum epidendroides* Hb. Kth. Die Lippe weiss mit Purpur und gelber Spitze. — Der eine von uns hielt das *Odontoglossum epidendroides* Lindl. (nicht Hb. Kth.: dieses hat halbrunde häutige, nach vorn gerichtete Oehrchen) für das *O. Schillerianum*. Jenes passt aber noch besser auf diese Art. Neu-Granada. 3—6000'. v. Warscewicz.

Huc: *Odontoglossum epidendroides* Lindl. Fol. l. c. N. 1. (non Hb. Kth. N. G.):

Pseudobulbis ovato oblongis compressis, foliis lanceolatis subcoriaceis, scapo racemoso multifloro, sepalis petalisque lineari-lanceolatis acuminatis, labello angusto unguiculato hastato acuminato basi bicorni, columna tomentosa, auriculis erectis angustis acuminatis.

Damp forests of Pamplona, at the height of 8500 feet: November—Linden, 1261.

Flowers large, yellow, scentless, with broad brown blotches, according to Humboldt and Bonpland. The plant from Mr. Linden, which I suppose to be the same as this, is described by that traveller as having pseudobulbs small, oval, leaves strait, lanceolate; stem twelve to sixteen inches long; flowers fragrant; sepals linear, golden-yellow, spotted with purple; lip white, spotted with purple. The column is very downy; and the claw of the labellum is united half way to the face of the column.

Rehb. fil. Bonpl. II. 278: Ocanna: Wälder bis 9000'. N. 1162. Schlim. Rehb. fil. Bonpl. III. 66: b. majus: flore duplo majore. Ocanna. Wagener.

2. ODONTOGLOSSUM CONSTRICTUM Lindl. in Bot. Reg. 1843, Misc. 25. L. F. l. c. n. 2:

Follii lineari-lanceolatis pergameneis basi valde angustatis, panicula laxa racemosa, sepalis petalisque lineari-lanceolatis acuminatis, labello medio constricto; hypochilio oblongo, epichilio subpandurato cuspidato serrato basi lamellis 2 serratis aucto, columna bicirrhosa.

(B.) *majus*. Flowers larger. Epichil hastate.

Wild in La Guayra, gardens: B. in the Caraccas; April 1842—Linden, 623.

A much more slender plant than the last, without the long horns at the base of the lamina of the lip. Flowers yellow, spotted with brown, except the lip which is white stained with violet.

Rehb. fil. Bonpl. II. 12. Caracas. Wagener.

3. ODONTOGLOSSUM NAEVIUM Lindl. in Paxtons Fl. Gard. I. t. 48. F. l. c. N. 3:

Pseudobulbis costatis, foliis tenuibus lanceolatis basi angustatis, panicula diffusa, sepalis petalisque angustis ovato-lanceolatis acuminatis un-

dulatis, labello subconformi pubescente vix hastato; cristae dentibus 2 grossis subtrilobis pubescentibus, columnae cirrhis subulatis patulis.

B. majus. Flowers much larger. Lip not hastate, but rounded at the base, very slightly serrate. Spots much more rose-coloured.

Wild in Demerara—Schomburgk; Venezuela—Funck and Schlim. 721; in the province of Truxillo, near S. Lazaro and La Penna, at the height of 6000 feet, flowering in August; B. New-Granada, in the province of Pamplona, at the height of 8000 feet—Linden, 146.

Flowers white, spotted with purple or rose-colour; according to Funck and Schlim the lip of this plant is yellow, a circumstance due perhaps to the fading of the flowers. Very much like *Oncid. phymatochilum*, which is however a true *Oncid.*

Rehb. fl. Bonpl. II. 278. S. Marta 5—6000'. Schlim 1202. Bonpl. III. 66. Ocanna 4000'. Wagener. — Walp. Ann. III. p. 560.

4. *ODONTOGLOSSUM ODORATUM* Lindl. in Orch. Linden., N. 86. L. F. Nr. 4:

Foliis anguste ensiformibus pergameneis, panicula amplissima, labello hastato lobis lateralibus rotundatis intermedio acuminato apice subundulato pubescente disco bidentato, columnae pubescentis cirrhis duobus runcinatis setaceis duobus minimis recurvis.

Wild in Venezuela; in the damp and gloomy forests of the Sierra Nevada, of Merida, at a height of 5000 to 7000 feet; June, August—Linden, 623.

Pseudobulbus oval, acute, ribbed; leaves lanceolate; flowers numerous, sweet-scented. Sepals golden-yellow, spotted with red. Lip white, purple at the base, according to Linden. The difference in the form of the lip, as well as in the colour of the sepals, makes it easy to distinguish this from *O. naevium*. The appearance of the plant when dried is very much like that of *O. pardinum*.

Rehb. fl. in Bonpl. II. 12. Merida. December. 6000'. Dazu eine kleine verkümmerte Form mit weniglüthiger Traube, welche auch Herr Moritz sammelte. Caracas. Wagener.

5. *ODONTOGLOSSUM GLORIOSUM* Lindl., Rehb. fl. Rehb. fl. Bonpl. II. 278:

Aff. *Odontoglossum naevium* Lindl., paniculatum, labello margine plano nec crispulo, antrorsum valde attenuato, carina in ima basi praeurupta exeunte in callum quadrigemium, dentibus acutis ascendentibus velutinis, nec antrorsis rhombeis serratis, gynostemio gracili longiori. (*Odontoglossum naevium majus* Hort. Lind. verosimiliter Lindl.)

Panicula effusa ampla. Flores illis *Odontoglossi naevii* multo (duplo) majores; candidi, carmineo-purpureo guttati. Sepala ac tepala lanceolata acuta, paulisper undulata. Labello ligulatum, basi rotundatum, ante basin utrinque bidentatum. Gynostemium gracile, medio valide angulatum, apice utrinque erecto acuminatoque auriculatum. — Steht zwischen *Od. naevium* Lindl. und *praestans* Rehb. fl., Wsewz.; letzteres hat eine Lippe, welche viel kürzer, als tepala, völlig verschiedene Schwielen der Säule und breitere Ohrchen. — Neu-Granada: Provinz Soto in Eichenwäldern. 8—9000'. Nr. 406. Schlim. — L. c. III. 66: Ocanna. 6000'. Wagener.

6. *ONCIDIUM SCHLIMII* Lindl., Rehb. fl. Bonpl. II. 278:

Aff. *O. epidendroidi* Hb. B. Kth., sepalis petalisque integerrimis, labello pandurato acuto denticulato; carinis apice falcatis radiantibus in basi 5—7; alis gynostemii rhombeis apice laceris.

Folium oblongolanceolatum acutum. Pedunculus ultrapedalis, rariflorus, superne flexuosus, bractee ovatae acutae tertiam ad quintam ovarii pedicellati aequantes, sepalis oblonga acuta basi cuneata, tepala basi paulo latiora, labelli unguis linearis laminae 5. vel 6. partem aequans bicarinatus, lamina plicata refracta, margine minute denticulata, pandurata, triloba, lobi postici rotundati, sinu obtuse triangulo a lobo medio sejuncto, lobus medius postice hastatus, ceterum rotundatus, apice apiculatus,

lamellae 2 a basi usque ad ortum lobi medii, carnoso falcatae, apice subulatae, interjecta carinula brevior, utrinque superadditae 3 carinulae brevissimae, extrorsae; denticulus falcatus a carinis liber utrinque in disco; gynostemium curvum, apice dilatatum, androclinium postice angulatum, alae quadratae retusae, saepius 2—3-fidae; sinus inter alas summas ac basilares anguste exciso semilunatus duas quintas partes longitudinis gynostemii occupans, anthera galeata, apice tridentata, dente medio longiori. — Ocanna, Januar 7000—8000'. Nr. 405. Schlim. — Bonpl. III. 66. Ocanna. Wagerer.

7. *ODONTOGLOSSUM PRAESTANS* Rehb. fil. v. Wswcz. Bonpl. II. 99:

Aff. *O. naevio* Lindl. labelli lobo medio laevi, cristis in basi 4 carinaeformibus, rhombeis, externis 2—3-dentatis, mediis productis 4—6-dentatis.

Folia linearilanceolata acuta. „Paniculata macroclada“, rami densiflori (—15), bractee lanceolatae acutae ovaria dimidio aequantes, sepala ac tepala linearilancea acuminata, labellum trilobum, angustum, lobi laterales erecti cartilaginei abbreviati rotundati dense sericeo puberuli, lobus medius refractus oblongolanceus basi utrinque semicordatus omnino laevis, cristae inter lobos laterales 4 cariniformes, rhombeae, externae superne 2—3-dentatae, mediae paulo anteriores, 4—6-dentatae; gynostemium erectum, androclinium postice triangulo elevatum, alae apicales porrectae falcatae nunc runcinatae, dens productus parvus utrinque in medio gynostemii angulo. Nächst *O. naevium*, dem es an Grösse gleichkommt, allein durch die Leisten auf Lippe und durch ganz glatte Mittellappen ohne Sammt leicht zu unterscheiden. Blüten gelb, purpurfleckig. v. Warszewicz.

Bonpl. III. 66: Ocanna. Wagerer l. c. 226: „Hallii“ hort. Rollisson.

8. *ODONTOGLOSSUM SCHILLERIANUM* Rehb. fil. in Bonpl. II. 12:

Racemo quinquefloro, grandifloro, bracteis squamatis parvis, sepalis tepalisque oblongis acutis expansis, labelli ungue angusto complicato, erecto, lamina cordato triangula acuta patula basi bicarinata, carinis divergentibus, gynostemio apice biauriculato, auriculis linearibus acutis erectis.

Eine wunderschöne Art, Herrn Consul Schiller gewidmet. Trugknollen länglich, klein, Stützblätter mit länglichen, spitzen Platten. Oberes Blatt länger (1 Fuss lang), am Grunde sehr verschmälert. Der oben zickzackige Blütenstiel über fusshoch trägt fünf Blüten von der Grösse derer des *Od. nobile* Rehb. fil. Aeusserlich sind die fünf Hüllblätter mattgelb mit röthlich angehauchten Flecken. Innerlich dagegen prangen sie in der Farbe des reinsten Goldes und zahlreiche Purpurflecken sind über sie ausgegossen. Die Lippe ist am Grunde schneeweiss, um die zwei Kiele stehen ein paar Purpurflecken, vor ihnen theilt sie sich in eine mittlere violette und eine vordere goldgelbe Zone. Die Säule ist weiss, mit einigen rothen Fleckchen. Wahrscheinlich fällt diese Art mit *Odontogl. epidendroides* „Humb. Kunth.“ Lindl. Folia *Odontoglossum* Nr. 1. zusammen. Ein Blick auf die citirte Tafel beweist, dass Humboldt's Pflanze durch runde seitliche Oerchen himmelweit verschieden ist — eine Blüthe im Berliner Herbar bezeugt die Richtigkeit der Abbildung.

Rehb. fil. Xen. I. Tab. 22. I. pag. 58.

9. *ODONTOGLOSSUM CIRRHOSUM* Lindl. Orch. p. 211. N. 2. L. F. N. 5:

Sepalis lanceolatis petalisque latioribus undulatis acuminatissimis maculatis labello longioribus, labelli unguiculati lamina cordata acuminatissima basi cornubus duobus longis porrectis instructa, columna apice bicirrhosa.

Wild in Guayaquil; in the valley of Mindo, at the height of 6000 feet—Colonel Hall.

Nothing more is known of this plant than could be gathered from the examination of a few dried flowers. They appear to be yellow, with some broad purplish blotches.

10. ODONTOGLOSSUM HALLII Lindl. Bot. Reg. t. 1992. L. F. Nr. 6:

Pseudobulbis ovatis acuminatis ancipitibus, foliis ensiformibus in basi angustatis, scapo paniculato, sepalis petalisque ovato-lanceolatis acuminatis unguiculatis, labello oblongo acuminato lacero, crista baseos lamellata multifida, columnae alis bidentatis dente superiore aristato.

Wild in Peru; in the woods of Guayaz on the western declivity of Pichincha—Hartweg: on trees in the valley of Lloa, at the height of 8000 feet—Colonel Hall; in New-Granada, in the forests of Pamplona, at the height of 8500 feet; November—Linden 1263.

A most beautiful species. Petals yellow, spotted with purple; lip white. — Linden. Flowers three inches and a half in diameter.

11. ODONTOGLOSSUM LUTEOPURPUREUM Lindl. Orch. Linden. Nr. 85. L. F. Nr. 7:

Foliis ensiformibus basi longe angustatis, floribus racemosis, bracteis ovatis squamaeformibus, labello obovato quadrilobo limbriato lamellis quinque laceris pubescentibus, columna pubescente alis in cirrhos numerosos longos solutis.

Wild in Neu-Granada; in the thick forests of Quindiu, at the height of 8000 feet; February—Linden, 1284.

Leaves two feet long. Flowers three inches in diameter and more. *Pseudobulbs* oval thick, two or three inches long. Stem a yard high. Flowers large (like those of *O. Hallii*); petals bright yellow, spotted with purple; lip yellowish white, spotted with rose. A magnificent species.

12. ODONTOGLOSSUM INSLEAYI Lindl. Fol. Nr. 8:

Pseudobulbis ovatis compressis diphyllis, foliis coriaceis oblongo-ensiformibus subundulatis apice recurvis racemo paucifloro erecto rigido brevioribus, sepalis petalisque oblongis subaequalibus undulatis infimis basi connatis, labello angusto obovato reflexo basi auriculato, disci crista apice biloba dilatata utrinque in medio dente refracto aucta, columnae alis incurvis cirrhatis.

Oncidium Insleayi Barker in Bot. Reg. 1840, misc. 21. Bateman Orch. Mex. t. 21. Van Houtte, Flore des Serres, 1818, t. 62.

(*B.*) *macranthum*. Flowers twice as large, thinner, and much paler, without the rich red spots on the lip.

Wild in Mexico—Barker; Oaxaca—Loddiges.

Flowers two and half to three inches in diameter, yellowish, spotted with rich brown; the lip brighter yellow, spotted with red, chiefly round the edge. This plant has much the habit of *O. grande*, from which it differs in the form of the lip, and in the column being furnished with red subulate horns curved forwards instead of having a pair of broad rounded membranous ears. The slight union of the lateral sepals occurs also in a few other species.

§. 2. *Xanthoglossum* L. F. p. 4;

Columna auriculata vel aptera. Labellum ungue longo lineari (saepius bilamellato) instructum semper luteum.

With this section the attenuated or cirrhose condition of the auricles of the column disappears, not to recur through the remainder of the genus. *O. grande* is notoriously very near *O. Insleayi*, and the two connect the sections *Euodontoglossum* and *Xanthoglossum*. The present and following sections are well marked by the long narrow unguis of the lip, beyond which the limb suddenly expands into a thin plate.

12. ODONTOGLOSSUM GRANDE Lindl. in B. R. 1840. Misc. Nr. 91. Bat. Orch. Mex. Guat. t. 24. Morren Ann. Gand, I. t. 37. Bot. Mag. t. 35. Lindl. Fol. Nr. 9:

Sepalis lanceolatis lateralibus convexis falcatis petalisque oblongis obtusiusculis latioribus subundulatis, labello subrotundo basi auriculato

sepalis plus duplo brevioribus: disci crista apice truncata bituberculata utrinque in medio dente calloque aucta, columnae tomentosae auriculis rotundatis convexis incurvis.

Wild in the cooler parts of Guatemala—Skinner, Hartweg.

The dried flowers measure six inches and a half from the tip of the petals, and the fresh ones are even larger. They are yellow, almost covered with cinnamon-brown bands and blotches. The auricles at the base of the lip turn their posterior edges down and inwards till they meet beneath the unguis and there grow together. Two to five flowers grow together on a scape, which is seldom more than five or six inches long. This noble species, now so common in gardens, has been found by Mr. Trevor Clarke to live in health and to flower in the open air in England under the shade of the laurel, during the summer. Mr. Skinner states that in its native country it lives in a climate the extreme temperatures of which are sixty and seventy degrees, and prefers damp shade.

Obs. *Odontoglossum tigrinum* L. F. Nr. 10. cf. *Oncid. tigrinum* Lex. supra p. 794.

14. ODONTOGLOSSUM MACULATUM Llave Orch. Mex. 2. 35. B. R. 1840. t. 30. L. F. 11:

Pseudobulbis oblongis compressis monophyllis, foliis oblongis nervosis acutiusculis racemis pendulis multifloris brevioribus, bracteis navicularibus herbaceis ovario brevioribus, sepalis lineari-lanceolatis acuminatis discoloribus, petalis oblongis undulatis acuminatis, labello cordato acuminato subcrenato; appendice unguis bivalvi concava cochleari apice libera bidentata per medium argute serrulata, columna pubescente subaptera.

Wild in Mexico—Barker, Karwinski.

Sepals chestnut-brown. Petals and lip clear yellow, spotted with brown. Differs from *O. cordatum* chiefly in the petals being broader than the sepals and much more acuminate, the racemes drooping, not stiff and erect, the lower bracts about half as long, and the upper quite as long as the ovary, and in the want of a double tooth which, in *O. cordatum* standing at the very base of the stalk of the lip, presses itself against the foot of the column.

Pescatorea t. 28.

15. ODONTOGLOSSUM CORDATUM Lindl. in Bot. Reg. 1838. Misc. 90. Knowles and Westcott, Floral Cabinet t. 100. L. F. N. 12:

Pseudobulbis oblongis compressis diphyllis, foliis latooblongis planis aculis scapo squamis carinatis vaginato brevioribus, racemo stricto disticho, bracteis navicularibus acuminatis membranaceis ovario multo brevioribus, sepalis petalisque lineari-lanceolatis acuminatissimis, labello cordato acuminatissimo integerrimo appendice unguis carnosae apice biloba basi utrinque dente unico aucta, columna pubescente clavata subaptera.

Wild in Mexico—Barker; in Guatemala—Hartweg; on the Cumbre of Choacás.

Sepals and petals richly blotched with brown upon a yellowish green ground. Lip white, with the crest at the base purplish, and the apex spotted and blotched with rich brown.

Pescatorea t. 26. — Hook. B. M. 4878. (sub *O. maculato*).

Obs. *Odontoglossum umbrosum* Rehb. L. F. Nr. 13. cf. *Oncid. linguiforme* Lindl.

16. ODONTOGLOSSUM MYSTACINUM Rehb. fil. v. Schl. B. Z. 1852. et L. F. Nr. 14:

Pseudobulbis ovalibus compressis corrugatis monophyllis basi polyphyllis, foliis ligulatis acutis planiusculis carinatis scapo gracili subramoso multo brevioribus, bracteis herbaceis lanceolatis, pedunculis duplo brevioribus, sepalis petalisque ovatis acuminatis, labello unguiculato

cordato obovato subrependo plano apice reflexo medio pubescente ungue obsolete lamellato, columnae alis multifidis.

Cyrtochilum mystacinum Lindl. in B. R. 1838, Misc. 38. 1839, t. 62.

Wild in Peru—R. Harrison.

A slender plant, with distant yellow whole-coloured flowers the size of *O. Bictoriense*.

17. **ODONTOGLOSSUM CARINIFERUM** Rehb. fl. in B. Z. 1832. p. 638. L. F. Nr. 14:

O. paniculatum, sepalis petalisque oblongis acutiusculis basi subcuneatis dorso carina crassa auctis pergameneis, labello sessili ligulato dimidio anteriore subito in laminam reniformem denticulatam medio antice apiculatam extenso membranaceo, lamellis rhombeis extrorsum tri-quadridentatis supinis utrinque in ligula labelli basilari, raphi utriusque lamellae carinatae antrorsum in tres digitos excurrente, columna elongata alis elongatis crenulatis hyalinis inferioribus 3 utrinque obtusatis, crassioribus, clinandrio vix marginato. — Rehb.

Wild in Central-America—Rehb.

Panicle zigzag branches. Bracts triangular, short. Flowers yellowish green, stained with olive-brown. Lip whitish yellow, with purple crests. No other species hitherto known has carinate sepals and petals. — Rehb. Described by Mr. Reichenbach from fresh specimens cultivated in Germany.

18. **ONCIDIUM BICOLOR** Lindl. in Benth. Pl. Hartw., Jan. 1845. B. R. 1845. Misc. p. 59. L. F. Nr. 16:

O. foliis lanceolatis scapo simplici paucifloro flexuoso subaequalibus, sepalis petalisque ovatis acutis subundulatis aequalibus, labello unguiculato obovato apiculato basi cuneato, denticulis quibusdam (sex) in unguem, columnae brevis alis linearibus decurvis serratis.

Wild in Peru—Ruiz and Pavon.

Only known from a drawing in Sir W. Hooker's Herbarium, copied by Mathews from the figures of Peruvian plants left at Lima by Ruiz and Pavon, Nr. 112. The flowers are large, bright violet, with a great whole coloured yellow lip. It would appear from the figure that each edge of the unguis is occupied by three strong equal curved teeth, which meet at the point of the unguis.

19. **ODONTOGLOSSUM TRIPUDIANS** Rehb. fl. Warscewcz. Bonpl. II. 100:

Aff. *O. rigido* sepalis tepalisque subaequalibus, sepalis lateralibus margine inferiori unidentatis, labelli ungue brevissimo, lamina pandurata bicarinata, carinis contiguis apice divaricatis, papulis filiformibus utrinque in basi liberis, alis rhombeis trifidis.

Racemus elongatus, pluriflorus, bracteae triangulae ovaria pedicellata brevia dimidium prope usque aequantes, tepala oblonga acuta basi cuneata, lateralia prope rhombea, utrinque medio angulata, angulo inferiori unidentigero, tepala subaequalia, lobellum ab ungue brevissimo panduratum, angustum, lobi basillares obtuse angulati antrorsum angustati, lobus medius tertia brevior apicularis reniformis acutus, lobulatus, denticulatus, crispus, carinae 2 a basi ad medium contiguae, ibi in carinas superne laceras divergentes, foveam sub se et inter se mittentes, carinulae apice filiformi liberae extrorsae utrinque in lobis lateralibus, gynostemium incurvum, limbi foveae stigmaticae magnae producti, androclinium membrana humili denticulata marginatum; alae antrorsae rhombeae trifidae, alae obtusangulae super imam lobelli partem, anthera antice bene rostrata. Goldgelb mit braunrothen Flecken. Peru. v. Wswz.

20. **ODONTOGLOSSUM RIGIDUM** Lindl. in Benth. Pl. Hartw., p. 152. Bot. Reg. 1845. Misc. p. 58. L. F. Nr. 17:

O. foliis oblongis basi angustatis scapo paniculato contracto pyramidalis brevioribus, sepalis lateralibus lineari-lanceolatis dorsali petalis-

que lanceolatis, labello unguiculato obovato cordato apiculato lineis duabus elevatis ex ungue in limbum divergentibus, columnae alis angustis decurvatis.

Wild in Peru; heights of Chachapoyas—Mathews, 168; growing on the ground in the Cordillera, near Loxa—Hartweg.

Panicle stiff, erect, pyramidal, with short ascending zigzag branches clothed at the base with mucronate scales. Bracts ovate, concave, mucronate. Flowers yellow, whole-coloured, with a very long narrow stalk to the lip.

21. ODONTOGLOSSUM EPIDENDROIDES Hb. Kth. N. G. Sp. Pl. I. 351. t. 85. Rehb. fil. Bonpl. II. 99:

Pedunculus validus pedalis simplex racemosus, rariflorus, bracteae triangulae ovario multoties breviores, sepala oblongolancea acuta basi anguste cuneata, lateralia labello supposita, tepala latiora et latius cuneata, subfalcata, labellum gynostemio basi adnatum, unguis linearis arrectus per totam superficiem margine omisso bicarinatus, lamina refracta anguste elliptica, acutiuscula, minute lobulata, minutissime denticulata, ungue longior, callus a basi usque ante medium in dentes 2 ancipites acutissimos excurrentes, interjecto denticulo multo breviori, superaddito utrinque callo dentiformi extrorso minuto; gynostemium gracilentum, semiteres, apice curvulodeclinatum, auriculae juxta foveam rotundatae, nunc bilobae minute denticulatae, alae a medio gynostemio basin usque pergameneae, sinu exciso ab alis superioribus sejunctae.

Rehb. fil. Xenia I. Tab. 22. II. 1. 2. p. 59.

22. ODONTOGLOSSUM SCEPTRUM Rehb. fil. Wrszw. Bonpl. II. 99:

Aff. *O. triumphantii*, carinis radiantibus in basi laminae labelli 12, gynostemii alis lobato laceris.

Pedunculus pedalis, racemosus, pluriflorus (8—9), bracteae lato triangulae quartam seu quintam ovarii pedicellati aequantes, sepala oblonga acuta basi cuneata, tepala rhombea acuminata, margine lacera, hinc inde semihastato dentata, lacera, crispa, labelli unguis brevissimus, lato linearis, laminae quintam vix aequans, lamina pandurata, refracta, lobi laterales obtusanguli margine denticulati, sinu minuto transeuntes in lobum medianum anticum prope duplo latiore, transverso ovatum, apiculatum margine lobato denticulatum, carinis radiantibus in basi 12, mediis lateralibus productis, rhombeis, dorso laceris, antice apiculatis, gynostemii incurvi alis apicularibus rhombeis lobatolaceris, lobis fissis, sinu semicirculari exciso alas inter et alas baseos mox in unguem medio adnatum labelli transeuntes. Blüten etwas grösser als die des *O. luteopurpureum* Lindl. Sepala fast ganz braun; Lippe und Tepala hell, weisslichgelb mit Purpurflecken. Neu-Granada. v. Warszewicz.

23. ODONTOGLOSSUM TRIUMPHANS Rehb. fil. Bonpl. II. 99:

Aff. *O. luteopurpureo* tepalis erosis, labello basi bifalci, utrinque bicalloso, gynostemii alis rhombeis ascendentibus margine externo erosulis.

Folia oblonga lanceolata acuminata, basi attenuata, pedunculus elongatus, racemosus, internodia elongata, bracteae triangulae ovarii pedicellatis 4.—5. breviores, sepala oblonga acuta, basi bene angustata, tepala subaequalia, latiora, magis acuminata, utrinque hinc illinc lobulata, sinuato dentata (1), labelli unguis linearis laminae tertiam adaequans, disco bicarinatus, dimidio cum gynostemio connatus, lamina pandurata, apiculata, margine denticulata, paulo ante apicem unguis utrinque sub plica extrorsa refractum, carinae unguis excurrentes in dentes antrorsos falcatos tertiam laminae aequantes, interposita in sinu utriusque papula minutissima, papulae 2 majores extrorsae pone carinas, gynostemium semiteres apicem versus curvatum, alae pone foveam rhombeae minute denticulatae, sinu quadrato separatae ab alis inferioribus rectilineis basin usque progredientibus. Blüten noch um $\frac{1}{4}$ grösser als bei *Hallii*, unter dessen Namen es in Gärten geht; auch jedenfalls das sogenannte *O. Hallii* in Orchideae Lindenianae. Neu-Granada. v. Warszewicz.

Rehb. fil. in Bonpl. II. 218:

Eine der stolzesten Arten dieser herrlichen Gattung. Nur *O. grande* hat grössere Blüten. Ocanna. Wälder 7—8000'. Nr. 404. Schl. Bonpl. III. 66. Ocanna. 6000'. Wagener. — Pescatorea t. 46.

24. *ODONTOGLOSSUM SPECTATISSIMUM* Lindl. Fol. Nr. 55:

Pseudobulbis ovatis monophyllis, foliis lanceolatis in petiolum canaliculatum angustatis scapo simplici stricto 3—4-floro aequalibus, bracteis ovatis brevibus membranaceis, sepalis petalisque lanceolatis acutissimis aequalibus, labelli basi angustati limbo ovato apiculato denticulato crista simplici antrorsum bicurvi denticulo utrinque adjecto, columnae alis membranaceis denticulatis aculis.

Wild in Neu-Granada—Linden, 147.

Whole plant about a foot high. Flowers nearly three inches in diameter, strongly blotched with some very dark colour upon a pale ground. One of the finest species, with the sepals and petals so broad that it approaches nearly to the next division.

§. 3. *Leucoglossum* L. F. p. 8:

Columna auriculata vel aptera. Labellum ungue longo lineari (semper bilamellato) instructum, album aut purpureum.

These species have in general membranous delicate flowers, and never show the least tendency to produce a yellow colour in their lip. Yellow indeed is unknown among them except in the two plates that surmount the unguis of the lip.

25. *ODONTOGLOSSUM STELLATUM* Lindl. in B. R. 1841. Misc. 25. L. F. Nr. 18:

Pseudobulbo ovali compresso, folio solitario lanceolato recurvo, scapo subbifloro, bracteis ovarii triquetri medium haud attingentibus, sepalis petalisque aequalibus linearibus acuminatis herbaceis, labello rhomboideo subrotundo grosse dentato appendice unguis truncata quadridentata apice libera.

Wild in Mexico—Hartweg; Guatemala, on the Volcan del Fuego and Cuesta of Argueta—Skinner.

Of nearly the same size and habit as *O. Rossii*, from which it differs in the sepals and petals being equally herbaceous and narrow, of a dull olive green, faintly spotted or rather clouded with purple. It has a pure white lip.

Huc: *O. (Leucoglossum) erosum* Rehb. fil. v. Warscewz. Bonpl. II. 99:

Aff. *O. rubescenti* tepalis sepalisque aequalibus.

Pedunculus 2—3florus, a spatha ancipiti acuta membranacea fultus, bractee membranaceae lanceolatae acutae ovarii pedicellatis sexies — decies breviores, sepala ac tepala linearia acuminata, lamella unguis oblonga excavata apice libero quadriloba, lobis mediis parvulis, lamina triangula, lateribus posticis paulo ascendentibus integris, limbo reliquo eroso lobulato; gynostemium gracile, apterum. Blüthe so gross, wie bei *O. stellatum*, Hülle und Lippe purpurn. Veraguas. v. Warscewicz.

Huc: *Odontoglossum erosum* A. Rich. Gal. in Ann. Sc. nat. Jan. 1845:

Pseudobulbo ovoideo oblongo 1-phylo; fol. lanceolatis acutis; scapo 1-floro; sepalis luteis; labello lilacino late ovali margine eroso-denticulato. — Mexico.

25. *ODONTOGLOSSUM EHRENBERGII* Link, Klotzsch, and Otto, Ic. p. 38. t. 16. Paxton's Fl. Gard., III.; gleanings Nr. 496. Ic. 247. L. F. Nr. 19:

Pseudobulbis caespitosis globoso-subelongatis compressis, foliis solitariis ellipticis acutis membranaceis rigidis margine subreflexis, scapo unifloro medio articulo bibracteato, sepalis lanceolatis acuminatis dorso longitudinaliter carinatis patentibus, petalis latioribus oblongis acutis utrinque attenuatis recurvis, labello subcordato acuto undulato crenu-

lato; lamellis unguis callosis integerrimis antice in rostrum obtusum breve confluentibus, columna aptera puberula.

Wild in Mexico; on oaks near San Onofro, on the banks of the Zimapore river. — C. Ehrenberg.

This is one of the prettiest of the white-lipped *Odontoglossa*. In habit it is hardly distinguishable from *O. Rossii*, to which I formerly referred it; but it seems to have a dwarfer habit, smaller flowers, and especially thin delicate white sepals banded with brown, instead of green ones; the lip too is acuminate, not rounded, each stem bears but one flower, and the processes at the base of the lip are white, not yellow, and join into an undivided apex instead of a two-lobed one. It is just intermediate between *O. Rossii* and *O. stellatum*.

27. ODONTOGLOSSUM APTERUM Lex. Llave, Nov. Descr. 2. 35. L. O. Nr. 5. L. F. 21:

O. „bulbis ovalis depressis; foliis lato-lanceolatis nervosis conduplicatis; scapo tereti paucifloro; gynostemio aptero crasso.“

Wild in Mexico; on trees near Irape, flowering in March—La Llave.

Flowers white, with roundish purple spots collected near the base. Lip with a fleshy two-lobed unguis, having in front a pair of diverging teeth, and a crenated limb. Said by La Llave to be very like *O. Cervantesii*. Seems allied to *O. maxillare*, which has entire lip.

Huc: *Odontogl. Rossii* Lindl. Sert. Orch. sub t. 25. B. R. 1839. t. 48. L. F. 20:

O. pseudobulbis ovalis caespitosis ancipitibus monophyllis, foliis oblongo-lanceolatis scapo radicali subbifloro longioribus, bracteis membranaceis carinatis acuminatis, sepalis linearilanceolatis carinatis acuminatis patentibus, petalis oblongis obtusis revolutis, labello subrotundo ovato emarginato undulato lamellis unguis confluentibus rotundatis denticulis 2 anterioribus obtusis, columna aptera pubescente.

O. acuminatum Hort.

Wild in Mexico—Barker.

A small species, with one or two flowers only on the scape. The sepals are yellowish-green, blotched with brown; the petals are white, spotted with purple at the base. The lip is pure white, and slightly downy.

Huc: *Odontogl. Ehrenbergii* Van Houtte Fl. Serr. IX. 846.

28. ODONTOGLOSSUM NEBULOSUM Lindl. Sert. Orch. sub t. 25. L. F. Nr. 21:

O. pseudobulbis 2—3-phyllis, foliis oblongis acutis basi conduplicatis pedunculo terminali erecto paucifloro brevioribus, bracteis scariosis amplexicaulis ovario duplo brevioribus, sepalis petalisque latioribus membranaceis oblongis undulatis basi pubescentibus apiculo recurvo, labelli ungue cucullato carnosio lamellis duabus erectis dentibusque totidem anticis, limbo ovato acuto dentato pubescente, columna aptera elongata tomentosa.

Wild in Mexico—Karwinski, Galeotti.

This is the largest of the race with which it is associated; the scape which appears with the young leaves is about a foot high; and the flowers are three inches and a half in diameter. The lip varies in the degree of toothing, being either coarsely toothed, or merely denticulate.

29. ODONTOGLOSSUM GALEOTTIANUM A. Rich. in Ann. Sc. 1815. Jan. L. F. 22:

Pseudobulbis aggregatis 1-phyllis, folio elliptico lanceolato acuto, scapo foliis duplo longiore 3-floro, labelli „alis erectis obtusis truncatis“, limbo subcordato-acuminato, columnae margine alato alis angustis longis.

Wild in Mexico—Galeotti.

„Flowers large, white.“

30. ODONTOGLOSSUM MAXILLARE Lindl. in B. R. 1847. t. 62. L. F. Nr. 23:

O. sepalis lanceolatis acutis petalisque latioribus sanguineo-maculatis, labello ovato acuto integro basi maculato appendice unguis maxima alte concava carnosae glabra lutea antice bidentata bilamellata columnae apterae fere longitudine.

Wild in Mexico? —

I have only seen one flower of this beautiful plant, which might at first sight be mistaken for *O. Cervantesii*. It is, however, readily known by its wingless column, and especially by the very large size of the yellow appendage, seated at the base of the lip, which is scarcely shorter than the column. The flowers are pure white, with rich crimson spots at the base of all the six parts.

31. ODONTOGLOSSUM CERVANTESII Llave, Orch. Mex., 2. 31. L. O., Nr. 4. B. R. 1845. t. 36. Paxtons Flower Garden I. t. 15. L. F. Nr. 25:

Pseudobulbis ovatis angulatis; foliis solitariis oblongis in petiolum canaliculatum angustatis, scapo paucifloro, bracteis vaginisque membranaceis acutissimis equitantibus elongatis, sepalis membranaceis oblongo-lanceolatis acutis, petalis latioribus subunguiculatis acutis, labello cordato-ovato ungue carnosae cyathiformi pubescente antice bidentato medio tuberculato processibus 2 elongatis pilosis ante cyathum, columnae pubescentis auriculis rotundatis.

(A.) Lip slightly cordate, acute. Flowers very pale pink.

(B.) *membranaceum*. Lip deeply cordate, retuse. Flowers white.

O. membranaceum Lindl. Sert. Orch. sub t. 25; B. R. 1846, t. 34. Morren, Ann. Gand, I, t. 10.

Wild in Mexico—Karwinski, Barker; B. near Oaxaca—Loddiges.

Flowers large, with broken red concentric bands at the base of the sepals and petals; very sweet-scented.

Ad b. *membranaceum*: *Pescatorea* I. t. 5. Lem. Ill. I. c. t. 12.

32. ODONTOGLOSSUM COERULESCENS Ach. Richard, in Ann. Sc. 1845. Jan. L. F. Nr. 26:

„*Pseudobulbis ovoideo-oblongis compressis 1-phyllis, folio oblongo lanceolato acutissimo; scapo 1—2-floro; floribus albido-coerulescentibus; labello cordato, membranaceo, acuto, margine sinuoso, eroso; gynostemio clavato, pubente.*“

Wild in Mexico—Galeotti.

I have from M. Galeotti, without name, what may possibly be this species. If so, it resembles the preceding in its manner of growth, but the lip is ovate, repand, and obtuse, and the sepals are three times as narrow as the petals. In that case this and *O. rubescens* may have to be united; but the flowers of the latter are much smaller.

33. ODONTOGLOSSUM RUBESCENS Lindl. in Journ. of Hort. Soc. V. 35. L. F. Nr. 27:

Pseudobulbis uncialibus oblongis compressis monophyllis, racemo 2—6-floro folii longitudine, sepalis lineari-lanceolatis acuminatissimis rectis, petalis tenuibus oblongis undulatis, labello cordato obtuso crispo, unguis lamellis carnosae antice liberis medio cochleatis, columna angusta aptera tomentosa.

Wild in Nicaragua—Skinner.

Remarkable among the white-lipped species for its flowers being suffused with a tender blush colour. The sepals are very narrow, straight and sharp-pointed, richly spotted all over with crimson. The petals are twice as broad, and have similar spots, but only near their base; the lip is spotless, crisp, and cordate.

34. ODONTOGLOSSUM BICTONIENSE Lindl. in B. R. 1840. t. 66; Sert. Orch. sub t. 25. L. F. Nr. 28:

Pseudobulbis oblongis compressis 2—3-phyllis, foliis ensiformibus undulatis patentibus scapo racemoso duplo brevioribus, bracteis herbaeis lanceolatis acuminatis ovario duplo brevioribus, sepalis petalisque subaequalibus lineari-lanceolatis maculatis, labelli ungue bilamellato limbo cordato acuminato undulato, columnae alis transverse oblongis integris.

Cyrtorchilum Bictoniense Bat. Orch. Mex. et Guat. t. 6.

Zygopetalum africanum Hooker in B. Mag. t. 3812.

A stately species with very bright upright racemes of flowers, whose sepals and petals are green spotted with brown, and the lip either lilac or nearly white. It was stated in the „Botanical Magazine“, by mistake, to be African.

§. 4. *Myanthium* L. F. p. 11:

Columna auriculata vel aptera. Labellum sessile, vel saltem haud ungue lineari instructum. Sepala lateralia parallela, elongata, manifeste unguiculata. Flores saepe inconspicui.

In this section are collected all the small-flowered species, in which the prevailing colours are yellow and brown, with little brilliancy of tone. They all possess a peculiar irregularity of appearance in consequence of the length and parallelism of the lateral sepals, which project considerably below and beyond the lip. This is especially observable, when the flowers are expanding and when the real proportions between the parts are most readily observable.

a. Labellum cordatum aut basi valde obtusum, in apicem longum carnosum productum.

Obs. *Odontoglossum divaricatum* Lindl. O. Lind. Nr. 89. Tab. Nr. 29: cf. *Oncidium refractum* Rehb. fil. supra p. 707:

35. ODONTOGLOSSUM COSTATUM Lindl. Fol. Nr. 30:

Foliis lanceolatis tenuibus basi angustatis, panícula longa laxa subvolubili, floribus parvis distantibus internodiis duplo brevioribus, sepalis petalisque lanceolatis undulato-crispis recurvis imis semiconnatis, labello basi subrotundo 5-costato limbo longo angusto linguiformi, columnae alis angustis apice dentatis.

Wild in Venezuela; in the province of Truxillo, near Agua de Obispo, at the height of 8000 feet; August—Funck and Schlim, 1028.

A long straggling species, with the aspect of a small-lipped Oncid, but the column is clavate, and distinctly united with the base of the lip. When very young the lip has three central ridges which touch each other, and a pair of tubercles on each side; when the flower is full grown each pair of tubercles has become a rib, and the middle ribs have separated from each other by a considerable interval.

36. ODONTOGLOSSUM DIPTERUM Lindl. Orch. Linden Nr. 87. L. F. Nr. 31:

O. foliis ensiformibus versus apicem latioribus, panícula stricta racemiformi, sepalis lanceolatis sessilibus petalisque oblongis unguiculatis undulatis obtusis, labelli hastati glabri lobis lateralibus rotundatis porrectis subrenatis intermedio elongato, tuberculis disci duobus acinaciformibus ascendentibus quinque a fronte cuneatis minoribus, columna aptera, anthera pubescente.

Wild in New-Grenada; in the province of Mariquita, at the height of 9000 feet; January—Linden, 1277.

Terrestrial. Pseudobulbs oval, acute. Flower white spotted with purple, the size of *Oncidium altissimum*.

- b. Labellum oblongum, vel basi angustatum in linguam haud productum.

37. ODONTOGLOSSUM DENSIFLORUM Lindl. Orch. Linden Nr. 88. L. F., Nr. 32:

O. foliis lanceolatis elongatis coriaceis basi angustatis panicula contracta paulo brevioribus, paniculae ramulis brevibus flexuosis, sepalis obovatis apiculatis, petalis oblongis unguiculatis, labello oblongo obtuso plano lamellis 3 carnosis subpubescentibus intermedia abbreviata lateralibus antice dentatis, columnae angulis superioribus in dentem productis.

Wild in New-Grenada; the Paramo, near Boyaca, in the province of Tunja, at the height of 11,000 feet; March—Linden, 1877.

Terrestrial with oval roundish pseudobulbs. Flowers yellow, spotted with red; small, and apparently unwilling to spread flat.

38. ODONTOGLOSSUM ROBUSTUM Rehb. fil. v. Warscewz. Bonpl. II. 100:

Aff. O. densifloro labello oblongo retuso a basi in discum bicarinato, carinis contiguis basi paulisper divergentibus, serie transversa pappularum 4 anteposita, gynostemio apice utrinque obtusangulo.

Pedunculus calamum aserinum crassus, validus, ramuli a spathis ovatis acutis membranaceis stipati, flexuosi, pluriflori (—10), internodiis suis breviores, bracteae ovatae apiculatae cucullatae ovaria pedicellata dimidio aequantes, sepalis unguiculata, elliptica, apiculata, lateralia strenue deflexa, tepala late unguiculata ovata apiculata, labellum oblongum retusum, a basi medium versus bicarinatum (carinae humillimae), calli quaterni parvi antepositi una serie transversa; gynostemium gracile apice utrinque obtusangulo auriculatum, dorso apiculatum. Blüten trocken mennigroth, so gross wie die des O. ramulosum. Neu-Granada. v. Warscewicz.

39. ODONTOGLOSSUM MACRUM L. F. Nr. 33:

O. foliis lanceolatis elongatis basi in petiolum canaliculatum angustatis paniculae contractae aequalibus, paniculae ramulis brevissimis, bracteis scariosis ovario aequalibus, sepalis dorsali lanceolato erecto lateralibus unguiculatis crasse carinatis, petalis lanceolatis, labello ovato basi concavo medio constricto limbo linguiformi lamellis 2 ad basin 2 a fronte plicaque flexuosa utrinque, columna aptera.

Wild in Central-America; Puerto Muelo, at the height of 7000 feet.

A very small-flowered species, with the habit of O. densiflorum. Pseudobulbs terete, semitransparent. Flowers whitish yellow, with purple spots on the labellum. I am unacquainted with the handwriting of the ticket in my herbarium, and do not know from whom I received the specimen, which is numbered 1490.

40. ODONTOGLOSSUM IXIODES Lindl. in B. R. 1845. Misc. p. 55. L. F. Nr. 34:

O. caespitosum, fere ebulbe, foliis lineari-lanceolatis acutis striatis scapo simplici apice racemoso triplo brevioribus, bracteis ovario subaequalibus ovatis cucullatis, sepalis petalisque unguiculatis obtusiusculis, labello oblongo obtuso basi bilamellato medio tuberculato ($\frac{3}{2}$), columna aptera.

Cyrtochilum ixioides Lindl. Orch. p. 211.

Wild in New-Grenada; on the Paramo St. Fortunato—Gudot.

Scape a foot and a half high; flowers small, apparently yellow, in a short simple raceme, with two or three cucullate bracts a short distance below it.

41. ODONTOGLOSSUM RAMULOSUM Lindl. Fol. Nr. 35:

O. foliis loratis coriaceis panicula angusta racemosa brevioribus, bracteis minutis squamaeformibus, pedunculis divaricatis, sepalis petalis

lisque unguiculatis dorsali duplo latiore, labello oblongo obtuso basi bilamellato medio tuberculato ($\frac{3}{2}$), columna aptera.

Wild in Neu-Granada—Funck and Schlim, 1450.

Flowers small, yellow, with a deep brown stain at the base of each sepal and petal. Lip with a brown stain on each side of the principal lamellae. Column purple-brown. In the structure of the flowers this is extremely like *O. ixiodes*; but the peltate is long and narrow, with divaricating flowers, whose stalks are much longer, than the scale-like bracts

Rehb. fil. Bonpl. III. 66. Ocanna, 5000'. Wagener.

42. ODONTOGLOSSUM LONGIPES Rehb. fil. v. Warscwz. Bonpl. II. 100 :

Aff. *O. ramuloso* ovarii pedicellatis longissimis, labello ligulato rhombeo, utrinque medio antrorsum obsolete lobulato, carinis 2 a basi contiguis in disco divergentibus, interjecto denticulo in sinu.

Pedunculus validus calamum columbinum crassus, internodia inter ramulos inaequalia, summa valde approximata, ramuli a vagina ochreate retusa acuta stipati tenues, flexuosi, abbreviati, bracteae triangulae apiculatae cucullatae ovaria pedicellata prope pollicaria vix decima parte aequantes, sepalum summum oblongum apiculatum cuneatum, sepala lateralia longiora, longius unguiculata, elliptica acuta, tepala rhombea obtusangula, labellum rhombeum, ad angulos laterales obtusatos utrinque antrorsum lobulatum, hinc trilobum, carinae 2 a basi ad medium (inter lobulos laterales), ibi divergentes addito in sinu denticulo parvo, gynostemium humile, androclinium marginatum, alae ab angulis summis basin usque descendentes integerrimae. Blüten trocken rötlichgelb. Peru. v. Warszewicz.

43. ODONTOGLOSSUM MELANTHES Rehb. fil. v. Warscwz. Bonpl. II. 100 :

Aff. *O. ramuloso* labello in medio trilobo, lobis lateralibus rhombeis antrorsis, carinis 2 a basi parallelis contiguis, apice divergentibus.

Pedunculus validus, calamum corvinum crassus, rami a vaginis ochreatis apiculatis medianis stipati, flexuosi, paniculati, ramuli —4-flori, bracteae ochreae acutae, minimae, ovarii pedicellati subpollicaris nonam aequantes, sepalum dorsale unguiculatum ellipticum acutum, seu lateralia longius unguiculata, ceterum subaequalia, tepala oblongocuneata acuta, labelli lobi laterales antrorsum rhombi, lobus medius a latiuscula basi paulo dilatatus dein triangulus (igitur trapezoideus, lateribus anticis multo longioribus), carinae 2 contiguae apice paulo divergentes a basi usque ante ortum lobi medii, gynostemium humile, dorsum versus retractum, utroque angulo latius integreque alatum, alae apice obtuse apiculatae. Blüten so gross, wie die des *O. ramulosum* Lindl., schwarzpurpurn, Lippe weissgelb. Peru, v. Warscwz.

44. ODONTOGLOSSUM RETUSUM Lindl. in Benth. Pl. Hartweg. p. 152. L. F. Nr. 36 :

O. foliis lineari-lanceolatis papyraceis scapo paniculato brevioribus, bracteis ovatis, sepalis petalisque subsessilibus lanceolatis acutis supremo canaliculato, labello oblongo retuso basi bilamellato, columnae nanae alis maximis oblongis.

Wild in Peru; on rocks on the mountains of Saraguro; August—Hartweg.

Flowers small, apparently deep yellow.

45. ODONTOGLOSSUM DISTANS Rehb. fil. in Linnaea XXII., p. 848. L. F. Nr. 37 :

O. foliis oblongo-lanceolatis acutis basi angustatis pergamenis, panicula diffusa ramis distantibus, bracteis ovatis acutis pedicellis elongatis multo brevioribus, sepalo supremo oblongo acuto basi unguiculato lateralibus subaequalibus medium usque connatis dein divaricatis, petalis duplo latioribus basi subcuneatis sessilibus, labello oblongo acuto basi angustato lanellis 2 erectis carnosissimis emarginatis in limite unguis lamellaeque, „ovario“ brevi crasso aptero.

Wild in Venezuela; in the province of Merida, at Lagunete and Valle, at the height of 7—8000 feet—Funck and Schlim, 1031.

„Petals yellow, sometimes white. Lip rose-coloured at the base. Pseudobulbs creeping.“ — Funck and Schlim.

Cf. Walp. Ann. III. 559.

46. ODONTOGLOSSUM MYANTHUM Lindl. in Benth. Pl. Hartw. p. 152. L. F. Nr. 38:

O. foliis basi canaliculatis erectis scapo paniculato elongato flexuoso brevioribus, bracteis minutis, sepalis petalisque lineari-lanceolatis unguiculatis acutis, labello lanceolato acuto basi bilineato limbo deflexo, columnae crassae alis obsolete subulatis.

Wild in Peru; mountains near Loxa—Hartweg.

Leaves a foot and a half long; the scape twice as long; the panicle zigzag, narrow, and very much branched; the flowers minute.

47. ODONTOGLOSSUM LONGIFOLIUM Lindl. in Benth. Pl. Hartw. L. F. Nr. 39:

O. foliis lanceolatis papyraceis basi longe canaliculatis scapo subpaniculato gracili brevioribus, bracteis minutis, sepalis petalisque lanceolatis acutis longe unguiculatis, labello bilamellato oblongo acuto medio deflexo apicibus lamellarum auriformibus divergentibus, columnae alis falcatis minimis.

Wild in Peru; on the Cordillera, near Loxa, in July—Hartweg.

A small-flowered species with a little tendency to branch at the base of a slender few-flowered raceme.

Obs. *Odontoglossum zebrinum* Rehb. fil. Fol. Nr. 39. cf. *Oncid. zebrinum* Rehb. fil. supra p. 709.

48. ODONTOGLOSSUM MEGALOPHIUM Lindl. Orch. Linden, Nr. 83. —L. F. Nr. 40:

O. foliis lanceolatis in petiolum gracilem canaliculatum angustatis, panicula stricta racemosa ramulis subcompositis flexuosis, bracteis membranaceis acutis, sepalis spathulatis apiculatis lateralibus unguiculatis, petalis duplo latioribus sessilibus, labello subcordato-ovato obtuso subapice carinato, cristae lamellis 2 maximis, columna aptera.

Wild in Venezuela; in the thick forests of the Sierra Nevada, in Merida, at the height of 7000 feet; August—Linden, 682.

A small-flowered plant nearly allied to *O. longifolium* and *myanthum*. Pseudobulbs oval, acute, ribbed. Flowers yellow.

49. ODONTOGLOSSUM GRACILE Lindl. in Benth. Pl. Hartw., p. 151. L. F. Nr. 42:

O. foliis oblongis papyraceis basi canaliculatis angustatis scapo stricto gracili subpaniculato brevioribus, bracteis minutis, sepalis petalisque oblongis obtusis longe unguiculatis illis dorso carinatis, labello bilamellato oblongo obtuso limbo deflexo, columnae alis falcatis incurvis acutis.

Wild in Peru; on the Cordillera near Loxa—Hartweg.

Flowers small, reddish brown, with usually flat rounded sepals and petals. The scape is less than a foot high, with a slender raceme of seven or eight flowers at the end, and a very short branch with two or three flowers near its base.

Obs. *Odontogl. cimiciferum* Rehb. fil. L. F. Nr. 43. cf. *Oncid. cimiciferum* Rehb. fil. supra p. 712.

50. ODONTOGLOSSUM MENTIGERUM Rehb. fil. v. Wrsewz. II. 100:

Mento producto, labello cordato oblongo acuto subtrilobo, carinis undulatis 2 parallelis per discum.

Panicula diffusa, ramorum ramuli abbreviati, flexuosi, pauciflori, bractee squamiformes quartam ovarii pedicellati aequantes, sepala anguste unguiculata

ovata acuta, lateralia paulo longiora, tepala obovata acuta, labellum trilobum, lobi laterales rotundati, basi semicordati incisura minuta disjuncti a lobo antico ovato acuto, carinae 2 a basi usque ante apicem labelli erectae undulatae, gynostemii androclinium marginatum, quinquelobum, anguli alati, alae ab apice gynostemii pedem (!!) brevem usque descendentes integerrimae (anthera ac pollinia geneticae). Braunblühig. Blüthchen halb so gross, wie die des *O. ramulosum* Lindl.

Peru. v. Warscewicz.

51. ODONTOGLOSSUM FORCIPATUM Lind., Rehb. fil. Bonpl. II. 279:

Affine *Od. mentigero* labello ambitu triangulo basi utrinque rotundato, lateribus utrinque angulis insilientibus trilobo, lobo medio triangulo acuto, carina humili a basi in discum, carinis 2 semiovatis antice acutis inter sinus lorum in medio labello, gynostemio superne clavato aptero basi in pedem descendente.

Folium oblongum acutum basi cuneatum 6—8-pollicare. Panicula ramosissima, polyclada, flexuosa. Bracteae triangulae abbreviatae. Flores parvi, clausi. Sepalum summum ligulato ovatum acutum. Sepala lateralia more tribus labello bene supposita a basi angusta cuneata oblonga acuta. Tepala ovata acuta basi cuneata, breviora, latiora. Labelli trilobi lobi laterales semiovati, lobus medius triangulus; carinae 2 semiovatae antice acutangulae in disco. Blüthen gelb, braun gefleckt. Neu-Granada. Wälder Ocanas. Juni 1852. 1160. Schlim.

§. 5. *Isanthium* L. F. p. 15:

Columna auriculata vel aptera. Labellum sessile, vel saltem haud ungue lineari instructum. Sepala subaequalia, radiantia, lateralibus omnino sessilibus, aut parum unguiculata. Flores speciosi.

The species thus separated from *Myanthium* approach that section by *O. auro-purpureum* and its allies, but they never have in the same degree that manifest prolongation and parallelism of the lateral sepals which characterises *Myanthium*, as is readily seen upon inspecting the expanding flower-buds. All the species are handsome, with large yellow or white flowers; some preeminently so. In the first division the sepals and petals are narrow, and stand wide apart when expanded; in the second division, in consequence of their increased breadth, those organs almost or quite overlap each other.

a. Sepala et petala sub anthesi longe distantia.

52. ODONTOGLOSSUM AUROPURPUREUM Reichenbach fil. in Linnaea 22. 848. L. F. 15

O. foliis planis lanceolatis acutis angustatis, panicula diffusa maxima, bracteis oblongis apiculatis cucullatis, sepalis oblongis acuminatis unguiculatis undulatis lateralibus paulo longioribus basi subconnatis, petalis conformibus brevioribus basi cuneatis, labello sessili acuminato convexo basi dilatato rotundato laevissime trilobo, cristae carnosae glabrae laminis lateralibus magnis integerrimis callis teretibus ($\frac{3}{2}$), columna aptera.

Wild in Peru — W. Lobb; in Venezuela—Funck and Schlim, 1430.

Stem six feet high.—F. and S. Flowers golden-yellow, marked with purple.—Rb. A noble species with a stiff much-branched panicle of flowers, the stalks of which are twice as long as the internodes. Each flower measures about two inches in diameter. The bracts are almost equal to the internodes in some cases. Mr. Lobb's Peruvian specimens have a more compact inflorescence and larger flowers than those from Venezuela.

Walp. Ann. III. 559. — Rehb. fil. in Bonpl. II. 279: Blüthen goldgelb, gefleckt mit karminroth — Pamplona, 9—10000'. Januar Nr. 1185. Schlim.

53. ODONTOGLOSSUM REVOLUTUM Lindl. in Ann. Nat. Hist. 15. 256. L. F. Nr. 45:

O. foliis ensiformibus rigidis margine revolutis scapo rigido apice pyramidali paniculato brevioribus, bracteis laxis acutis cucullatis internodiis paulo brevioribus, sepalis petalisque lanceolatis unguiculatis undulatis acuminatis lateralibus paulo longioribus, labello cordato subrotundo in limbum linearem cuspidatum producto, cristae carnosae glabrae laminis lateralibus maximis intermedia filiformi apice in dentem validum producta digitis 2 utrinque, columna aptera.

Wild in Popayan; on the Paramo of Guanacas, at the height of 11,000 feet—Hartw.

This differs from the last in having a dense pyramidal panicle about eight inches long by five wide, and stiff leaves rolled back on either side up to the midrib. The crest is similar, except that the middle of the three anterior lobes is much larger than the others near it. The flowers appear to be yellow.

54. ODONTOGLOSSUM LINDENII L. F. Nr. 46:

O. foliis erectis ensiformibus scapo paniculato duplo brevioribus, paniculae ramis patentibus distantibus secundifloris, bracteis membranaceis cucullatis oblongis apiculatis internodiis aequalibus, sepalis petalisque unguiculatis lanceolatis undulatis acutis, labello ovato-lanceolato, cristae carnosae glabrae laminis lateralibus maximis intermedia filiformi apice dilatata libera digitis 2 utrinque teretibus in 4 planas emarginatas suppositas incumbentibus, columna aptera.

Wild in New-Granada, at the height of 9000 feet—Linden, 82.

Smaller than *auropurpureum*, larger than *revolutum*. Leaves not quite a foot long; scape from two to three feet high, with uniform lateral arms for more than half its length, each arm bearing from seven to five flowers, which form a regular unilateral rank directed upwards. The crest has, in addition to the parts found in the two previous species, four irregular flaps placed below the finger-like processes of its extremity.

55. ODONTOGLOSSUM RAMOSISSIMUM L. F. Nr. 47:

O. foliis longissimis ensiformibus acutis gramineis basi angustatis, panicula maxima ramosa divaricata, bracteis obtusis membranaceis ovario paulo brevioribus, sepalis unguiculatis petalisque angustis lanceolatis undulatis, labello sessili cordato basi dilatato undulato tomentoso in limbum convexum lanceolatum extenso, crista tomentosa lamellis 2 lateralibus latis antice cirrhatibus quinque brevibus à fronte, columna aptera.

O. angustatum Lindl. Orchid. Linden Nr. 90.

Wild in Venezuela; in the thick forests in the neighbourhood of Merida, at the height of 6500 feet—Linden, 661.

„A magnificent epiphyte. Pseudobulbs oval, compressed; stem three or four feet high, covered with innumerable flowers of a brilliant white. Petals rosy-purple at the base. Lip purple.“ — Linden. The panicle of this plant is very stiff and excessively branched in an angular straggling manner. In the general form of the parts it much resembles *O. angustatum*, to which I formerly referred it; but a more accurate examination shows that it is essentially different, the lip being cordate, not narrowed to the base, and the crest downy all over with a different arrangement and form of the lobes.

I am unacquainted with the variety *heterosepalum*, mentioned by Mr. Reichenbach in the „*Linnaea*“; Nr. 1242. of Funck and Schlim's collection not having reached me.

Rchb. fl. Bonpl. II. 12: Diese Pflanze ist unsern Orchideenfreunden nicht genug zu wünschen. Wohl hundert grosse rosenrothe Blüten mit Purpurlippe prangen an weiter Risper. Merida, Wagener.

56. ODONTOGLOSSUM ANGUSTATUM Lindl. in Bot. Reg. sub t. 1992. L. F. Nr. 49:

O. pseudobulbis compressis, foliis longis lato-lanceolatis erectis scapo gracili brevioribus, panicula flexili, bracteis carinatis cucullatis acutis internodiis duplo brevioribus, sepalis linearibus acuminatissimis lateralibus unguiculatis, petalis latioribus et brevioribus, labello ovato-lanceolato acuminato basi angustato, cristae lamellis lateralibus membranaceis tridentatis glabris intermedia triplici filiformi tomentosa apice in callum et cornua 2 lateralia expansa in appendicem bicornem pariter tomentosum suppositum incumbentia, columna elongata aptera.

Wild in Peru; in the valley of Lloa, at the height of 8000 feet—Hall; in the woods of Guayan, on the western declivity of Pichincha—Hartweg.

A much more slender plant than the preceding. Sepals one inch and a half long and scarcely more than a line broad. The flowers appear to be spotted. The membranous smooth-toothed side lobes of the crest of the lip and the long downy horns which terminate it are remarkable.

57. ODONTOGLOSSUM PARDINUM Lindl. in Sert. Orch. sub t. 25. L. F. Nr. 49:

O. foliis lineari-oblongis basi angustatis striatis scapo stricto laxo paniculato subaequalibus, bracteis membranaceis cucullatis acutissimis, petalis undulatis sepalisque angustioribus lanceolatis, labello unguiculato ovato-lanceolato acuminato, cristae pubescentis lamellis lateralibus basi dentatis apice 3-partitis intermedia elevata in fronte adjectis callis quibusdam teretibus, columna aptera.

Wild in Peru; on the ground near Surucucho—Jamieson; the Andes of Popayan—Hartweg.

Flowers handsome, yellow, spotted with brown in the original form sent to Sir William Hooker by Professor Jamieson. The Popayan plant is somewhat different; the flowers are smaller and apparently not spotted; and the crest of the lip is more downy with a few more teeth in front. The two plants can hardly however be distinct. I have from Professor Jamieson what appears to be identical with the Popayan form.

58. ODONTOGLOSSUM WAGENERI Rchb. fl. in Bonpl. II. 12:

Panicula brachyclada rariflora, bracteis membranaceis obtusis ovaria crassa dimidio aequantibus, floribus illos O. revoluti subaequantibus, sepalis cuneato unguiculatis paulo dilatatis lanceolatis acutis, summo breviori, tepalis cuneato oblongis acutis sursum falcatis sessilibus lamina sepali summi ter latioribus, labello a cuneata basi ovali tertio antico proboscideo lineari retuso, callis acutiusculis subvelutinis quatuor biserialis in disco, quinto aequali in disco illis interposito, gynostemio crasso aptero dimidium labellum aequante.

Sepala grün mit violetten Flecken. Tepala violett mit goldgelber Spitze. Lippe violett, Schwielen und Saum gelb. Säule unten grün, oben violett. Spitze gelb. Neben Od. *revolutum* Lindl., das einen herzförmigen Grund der Lippe und eine weitere Rispe besitzt. Caracas. 6000'. Mai. Wagener.

59. ODONTOGLOSSUM SPATHACEUM L. F. Nr. 50:

O. foliis oblongis basi conduplicatis, scapo erecto dense paniculato, bracteis oblongis spathaceis apiculatis internodiis longioribus, sepalis angustis acuminatis, petalis duplo latioribus, labello ovato-lanceolato, cristae pubescentis lamellis lateralibus apice unidentatis et bicirrhosis in appendicem bilobum bifalcem longiorem suppositam incumbentibus, columna elongata aptera.

Wild in New Grenada—Purdie.

A noble plant, with large panicles of spotted flowers, apparently yellow, with sepals an inch and a half long. The bracts are much larger and more spathaceous, than in the allied species.

60. *ODONTOGLOSSUM HASTILABIUM* Lindl. in Orch. Linden, Nr. 84; Hooker Bot. Mag. tab. 4272. L. F. Nr. 51:

O. foliis oblongis coriaceis, paniculae ramis spicatis, bracteis cymboformibus acuminatis ovario aequalibus, sepalis petalisque lineari-lanceolatis acuminatis undulatis, labello apice subrotundo-ovato acuto basi auriculis acutis lanceolatis porrectis aucto lamellis 5 elevatis, columnae alis obsolete undulatis margine versus basin membranaceo dilatato.

Wild in New Grenada; Tesqua, in the province of Pamplona, at the elevation of 2500 feet; April—Linden, 1376; on the road from Santa Martha to the Sierra Nevada—Purdie.

This handsome species has flowers three inches in diameter, with the appearance when dried, of *O. laeve*, but the flowers are white and sweet-scented. Petals and sepals greenish or greenish white, barred with red. Lip white, purple at the base. The base of the column, which is expanded on either side into an inflexed membrane, resembles that of *cristatum* and some others, but is very different from the tumid base of the genus *Oncidium*.

Bonpl. II. 219: Ocanna. Januar 5—6000'. Schlim 414. — Bonpl. III. 66. Ocanna 5000'. Wagener. — Pescatorea I. t. 11.

61. *ODONTOGLOSSUM LAEVE* Lindl. in Bot. Reg. 1844. t. 39 L. F. Nr. 52:

O. pseudobulbis compressis sulcatis, foliis oblongo-ensiformibus obtusis apice obliquis, floribus laxo racemoso-paniculatis, bracteis brevibus membranaceis, sepalis petalisque oblongo-linearibus acutis planis, labelli limbo panduriformi apiculato ungue laevi obsolete bidentato, columnae alis apice rotundatis crispis basi planis.

Wild in Guatemala—Skinner.

The fragrant flowers have cinnamon-brown blotches on the yellow ground of the petals and sepals; and the lip, which is white, is banded with violet across the middle. The absence of all but rudiments of a crest upon the lip is a very peculiar feature.

62. *ODONTOGLOSSUM KARWINSKII* Rehb. fl. in Bonpl. III. 214. Huc: *Miltonia Karwinskii* Lindl. Journ. Hort. Soc. IV. 77. c. ic.:

Scapo paniculato, sepalis petalisque oblongo-lanceolatis apiculatis, labello obovato rigido cristato venis centralibus recurvantibus lamellatis, auriculis columnae serratis, caudicula obovata.

Oncidium Karwinskii Lindl. Sert. sub t. 20.

Cyrtochilum Karwinskii Lindl. Bot. Reg. sub 1992.

Wild in Mexico: Karwinski in hb. reg. Monac.

A fine species with flowers $2\frac{1}{2}$ inches in diameter. Sepals and petals banded with brown on a yellow ground. Lip deep violet on the lower half, pale on the upper; the lateral sepals placed exactly beneath it. — Paxt. Mag. VI. XVI. Paxt. Fl. G. II. c. xyl. Van Houtte VII. p. 32. Xyl. ex Paxt. Mag. XVI. — Paxt. Fl. G. xyl. floris.

Obs. Mirum, plantam adeo spectabilem adeo rarissimam mansisse. Unde venerint, quae in Anglia florere specimina, non novi. In herbariis non nisi Karwinskiana occurrere mihi specimina.

63. *ODONTOGLOSSUM REICHENHEIMII* Lind. Rehb. fl. in Bonpl. III. 214:

Aff. *O. Karwinskii* Rehb. fl. (*Oncidium Karwinskii* Lindl.) et *O. laevi* Ldl. *gynostemii* alis obsolete apice et basi lobulum minutum sistentibus, labello oblongo basi cordato apice obtusato lobelato, callo tumido utrinque ante basin, carina gemina ante basin extabulatam *gynostemii* (cf. Pescatoream).

Tracht des *Odontoglossum laeve* Lindl. Dagegen in allen Theilen grösser. Der grosse Blütenstand zwei Fuss lang und länger, zickzackig, unten mit einigen Seitenzweigen; weder schlaff und stark rispig, wie bei *O. Karwinskii*, noch so gedrängt wie bei *O. laeve*. Blüthe wenig kleiner, als die des *O. Karwinskii*. Hüllblätter bedeutend schmaler, namentlich die Sepala; von Farbe grün mit Purpurbinden. Lippe am Grunde fleischig, vor dem Grunde purpurviolett, vorn weiss. Säule in der Mitte unter der Narbenhöhle mit Längskiel. *Odont. Karwinskii* ist vor Allem durch die oben und unten spitzen gesägten grossen Säulenflügel, viel breitere Hüllblätter, an der Spitze zweilappige und vorn sehr ausgebreitete, also geigenförmige Lippe gut unterschieden. Der Blütenstand ist bekanntlich eine schlaffe überhängende Rispe. Die Binden auf den Sepalen und Tepalen sind nach einem anderen Plane angelegt. Die Buckel auf dem Lippengrunde des Reichenheimii fehlen hier. *Odontoglossum laeve* Lindl. hat eine am Grunde ganz schmale und vorn ausgebuchtete Lippe, welche erst höher über der Basis umgeknickt ist, während *O. R.* und *K.* dieses gleich am Grunde thun. Ferner ist die Säule am *Od. laeve* unter der Narbe ausgehöhlt und hat keinen Kiel. Endlich sind die Säulenflügel sehr gross. — Diese Art theilt sich in den Wohlgeruch des *Odontogl. laeve* Lindl. und die Farbenpracht des *O. Karwinskii*. Aus Mexico von Herrn Ghiesbreght an Herrn Linden gesendet. — *Pescatorea* T. 19.

64. ODONTOGLOSSUM CRISTATUM Lindl. in Benth. Pl. Hartw. p. 152. L. F. Nr. 53:

O. foliis lineari-lanceolatis acutissimis scapo multifloro simplici paullo brevioribus, sepalis petalisque lanceolatis acuminalis, labello lanceolato acuminato limbo deflexo, crista glabra multipartita laciniis anticis latioribus, columna elongata basi membranaceo-marginata apice alis duabus uncinatis, anthera cristata.

Wild in Peru; mountains of Paccha—Hartweg.

Flowers spotted with brown, about as large as those of *O. cordatum*. Leaves very narrow.

65. ODONTOGLOSSUM LACERUM Lindl. in Sert. Orch. sub t. 25. L. F. Nr. 54:

O. pseudobulbis ovalibus ancipitibus, foliis lineari-oblongis in petiolum canaliculatum angustatis, racemo subpaniculato terminali gracili, bracteis longe distantibus ovatis acutis squamaeformibus, sepalis petalisque lanceolatis acuminatis, labelli limbo deflexo ovato-lanceolato lacero concavo apice cuspidato, cristae lamellis fimbriatis denticulis 2 anterioribus subulatis, columna glabra auriculis subtruncatis.

Wild in Peru; Casapi—Mathews, 1867.

Flowers large, bright lemon colour, with a brown blotch or two in the middle of the sepals and petals, and another at the upper half of the lip. Inflorescence very slender, with the flower-stalks not half the length of the internodes.

b. Sepala et petala sub anthesi imbricata.

66. ODONTOGLOSSUM PESCATOREI Linden in Paxt. Fl. Garden III. t. 90. L. F. N. 56:

O. pseudobulbis ovatis leviter costatis diphyllis, foliis loratis planis basi angustatis, panícula erecta diffusa multiflora, bracteis minutis, floribus membranaceis, sepalis ovato-oblongis apiculatis leviter undulatis, petalis conformibus duplo latioribus, labello cordato oblongo cuspidato subpandurato basi denticulato, cristae lamellis lateralibus distantibus cartilagineis laceris lineis duabus elevatis divergentibus apice denticulatis interjectis, columnae brevis alis brevibus laceris.

? *O. nobile* Reichenbach fil. in *Linnaea* 22. 850.

Wild in New-Grenada, in the province of Pamplona—Funck and Schlim.

Of this fine plant the panicle is from two to three feet high, and not much narrower. The flowers are of ample size, of a delicate semitransparent texture, with a faint blush line along the middle of the sepals, and a stain of yellow near the base of the lip, where also are found a pair of broad deep crimson lateral lamellae belonging to the crest, in the form of two lacerated appendages. The column itself is white. The ragged wings are stained with crimson. Since the publication of this in Paxton it has occurred to me that it is probably the *O. nobile* of Reichenbach fil., for which he quotes Funck and Schlim's collection, no. 1429, a number which I do not possess; but unless there is some typographical error in the learned author's specific character which destroys its meaning, his plant must be different, especially since he describes the lip as purple, and the other parts rose-coloured. My specimen of *Pescatorei* is without a number, but with a reference to an unpublished drawing, no. 69, which I have not seen. I am the more uncertain whether this can be *O. nobile*, because there is in reality nothing to separate it from *Odontoglossum*, as Professor Reichenbach partly suggests, the species being in truth extremely near *O. crispum*, the ragged crimson appendages at the base of the lip being evidently identical with the lateral plates so generally found in this genus.

Lindl. Paxt. Fl. G. III. 174:

It now appears that this beautiful plant fig. at plate 90. had been previously described by Mr. G. Reichenbach under the name of *Odontogl. nobile*, as has been suggested in the *Folia O.* It was however impossible to recognize the description, in consequence of the misprints which it contained; and we question whether under such circumstances Mr. Linden's name can be disturbed.

Obs. Lapsus non insunt in descriptione. Equidem amico Linden nomen pro hortis lubenter cessi. Sed modus lapsus indicandi, ubi lapsus non adsunt (calli enim carinae ipsi Lindley saepe synonyma), haud probandum. *Rchb. fil.* — Cf. v, Schl. B. Z. 1852. *Gartenorch.* Nr. 35. *Rchb. fil. Bonpl. II.* 278. *Ocanna. Wälder. Juli. 7000'.* *Schlim.* — *Bonpl. III.* 66. *Ocanna. Wagener.* — *Pescatorea I. t. 6.* — *Lem. Jard. Fl. IV.* 331. — *Walp. Ann. XIII.* 560.

67. *ODONTOGLOSSUM WARSCIEWICZII* *Rchb. fil. in v. Schl. B. Z. 1852. 692:*

Perigonii phyllo summo oblongo cuneato, obtusato, phyllis lateralibus externis oblongis acutis, angustioribus, lateralibus internis oblongis, cuneatis; labello a basi latissime cuneata dilatato, pandurato-quadrilobo, lobis lateralibus obtusatis, minoribus, vix productis, lobo anteriori late cuneato, alte bilobo, lobo utroque obtuse rhombeo, marginibus externis hinc sinuato, denticulo minutissimo interposito inter utrumque; callo erecto hippocrepico (maxillari) antrorsum clauso papillis velutino cum denticulo corneo inflexo in medio, basilari in ima labelli parte suberecto, gynostemio humillimo, fovea stigmatica magna, oblonga, denticulo in limbo inferiori, alis integris, angustissimis, foveam stigmaticam marginantibus.

Eine der herrlichsten Entdeckungen unseres Reisenden. Die schneeweissen Blüten tragen einen goldigen Kamm, der von dem schönsten Purpurroth gesäumt ist. Meine grösste Blüthe ist zwei Mal so gross als die des *Oncidium sessile* (im getrockneten Zustande): mithin nächst *O. grande* eine der grössten Blüten neben *O. nebulosum*. Blätter länglich, spitz. Deckblätter spitz-dreieckig, häutig, einnervig, sieben Mal kürzer als der Stiel des langen Fruchtknotens. Blütenstiel wenigblüthig. *Cordillera de Chiriqui. 8000' auf Leguminosen. October—Januar. L. F. sub 21' addit.*

68. *ODONTOGLOSSUM PHALAEOPSIS* *Lind. Rchb. fil. in Bonpl. II.* 278:

Affine *Odontoglossum Warscewiczii* *Rchb. fil.*, foliis linearibus acutis, racemo bifloro, sepalis oblongo-ligulatis acutis, tepalis obovatis obtusis, labelli pandurati portione antica latiori emarginata hinc lobulata, carinis 2 ad pedem gynostemii, una in medio anteposita, carinulis 2 antice

nunc unilamelligeris verruculis quibusdam utrinque circumjectis, disco velutino, gynostemii minuti alis membranaceis abbreviatis integris.

Pseudobulbus ligulatus anceps basi subdilatus monophyllus. Folium ultra pedale apice acutissimum. Pedunculus nunc spithamaeus. Flores illis *Odontoglossi Warscewiczii* nunc aequales. Perigonium candidum. Labellum hinc roseo aspersum. — Eine treffliche Acquisition für unsere Häuser! Die schönen grossen Blüten sind geeignet, mit *Miltonia spectabilis* und mit *Phalaenopsis* in die Schranken zu treten. Ein treffliches Bild liegt für die *Pescatorea* vorbereitet. Ocaña. Wälder bis 4000'. Nr. 501. Schlim.

Pescat. t. 41. — Bonpl. III. 66. Ocaña. 6000'. März. Wagener.

69. ODONTOGLOSSUM OERSTEDII Rehb. fl. Bonpl. III. 214:

Sepalis triangulis, tepalis obovatis retusiusculis, labello flabellato apice quadrilobo, sinu medio profundo, callo depresso ante basin angustam cordatam rhombeo apice bilobo, tumore velutino papuloso in centro, gynostemio aptero postice velutino.

Pseudobulbus anceps pollicaris. Folium tripollicare — quadripollicare, basi petiolato angustatum, lamina cuneato oblonga acuta. Pedunculus gracilis paucivaginatus uniflorus. Flos albus callo aureo maculis purpureis picto lineolis tribus flavis antepositis illi *Odontoglossi pulchelli* Bat. aequalis. In monte Irasu ad St. Juan. 9000'. Oersted! Adest etiam icon a cl. Warscewicz confecta.

70. ODONTOGLOSSUM CRISPUM Lindl. in Ann. Nat. Hist. 15. 256. L. F. Nr. 57:

O. foliis lanceolatis scapo multifloro paniculato (nunc brevi racemoso) brevioribus, bracteis ovatis acutis cucullatis internodiis multo brevioribus, sepalis ovato-lanceolatis petalisque ovatis acutissimis crispis laceris membranaceis, labello subconformi basi cuneato, cristae lamellis lateralibus brevibus tridentatis duabus alteris linearibus apice liberis interjectis, columnae alis rotundatis laceris.

Wild in New-Grenada; in the woods between the villages of Ziquapira and Pacho, in the province of Bogota—Hartweg.

A most beautiful species, occasionally as much as three feet high and more. Flowers large, yellow, with a purple spotted centre. Column deep purple. Differs from the last in the colour of the flowers, and in the form of the lip and its crest, but otherwise very similar.

71. ODONTOGLOSSUM PYGMAEUM Lindl. in Benth. Pl. Hartw. p. 82:

O. pseudobulbis ovalibus vaginis membranaceis acuminatis vestitis, foliis anguste ovalibus in petiolum angustatis racemo paucifloro flexuoso duplo longioribus, sepalis petalisque subaequalibus, labelli pubescentis rhombi dentati sessilis crista maxima bivalvi in medio tumida; valvis erectis rotundatis, columna brevi clavata aptera, ovario triptero.

Wild in Guatemala; at the foot of the active volcano Xetuch, about 8000 feet above the sea, near Quezaltenango—Hartweg.

This curious little alpine plant forms tufts of pseudobulbs and membranous sheaths, from among which just peep out the tiny colourless flowers, which are not above three lines in diameter, even if spread out. I have not seen the pollen-masses and it may not belong to this genus.

Huc: *Rhynchostele* Rehb. fl. in v. Schl. B. Z. 1852. 771:

Perigoni phylla lanceolata acuto-acuminata. Labellum trilobum. Lobi laterales basilares trianguli, subcarnosi, margine antico incrassato transcendentibus basin lobi medii, lateribus erecti, margine postico gynostemio appressi, fundo inter utrumque bilobo tumido; lobus medius membranaceus obtuse rhombeus, margine lobulato subtiliter denticulatus, primum ascendens. Gynostemium ab angusta basi transsectione

perpendiculari rhombeum postice tricaratum, limbo pone stigma tumido. Androclinium terminale, horizontale, quadratum, basin versus dilatatum limbosum, descendens in processum rostellarem oblongum, retusum, canaliculate limbosum ultra medium, stigma ovatum, basi angulato-protensum, maximum. Pollinia duo globosa, nullo pacto sulcata; caudicula linearis, glandula oblonga utrinque acutiuscula.

Rh. pygmaea (*Odontogl. pygmaeum* Lindl. in Benth. Pl. Hartw. 82.): Ich glaube, dass die ganz eigenthümliche Narbendecke, die ungespaltenen Pollinia, die eigene Gestalt der Säule und die Lippe diese Pflanze völlig von den ächten *Odontoglossen* unterscheiden.

§. 6. *Trymenium* Lindl. in Bot. Reg. 1843. t. 3. L. F. p. 21:

Clinandrium cucullatum, margine membranaceo saepe tripartito.

At first sight this would seem to be a distinct genus, and it may be hereafter considered so. But if any botanist should think the structure of the crest available for a generic character, I would remind him, that, although there is no apparent analogy between the crest of some of the *Trymenia* and that of the *Isanthia*, so neither do agree among each other in that respect, the crests of every species except *brevifolium* and *coronarium* being formed upon a different plan, and *O. citrosimum* having no crest at all.

72. *ODONTOGLOSSUM CITROSMUM* Lindl. Bot. Reg. 1842. Misc. 68, 1843, t. 3. L. F. Nr. 59:

O. pseudobulbis subrotundis compressis laevibus, foliis oblongo-ligulatis obtusis racemo paulo brevioribus, sepalis oblongis obtusis petalisque conformibus subaequalibus, labello unguiculato reniformi basi excavato marginibus callosis, clinandrii alis lateralibus subtruncatis dorsalique rotundato denticulatis.

Wild in Mexico—Karwinski.

Flowers very large, white, fragrant, stained with pink; the violet-coloured lip orange-yellow at the base.

Lem. Jard. Fl. Tab. 90.

73. *ODONTOGLOSSUM CORONARIUM* L. F. Nr. 60:

O. pseudobulbis ovalibus compressis, folio oblongo coriaceo basi canaliculato, racemo longo multifloro, bracteis linearibus canaliculatis ovario triplo brevioribus, sepalis petalisque subrotundis unguiculatis planis, labello longe cuneato retuso basi auriculis unidentatis subfalcatis obtusis subtus in unam connatis aucto, inter auriculas tuberculis 2 hoc didymo illo inferiore simplici acuto, clinandrio subserrato lobis rotundatis.

Wild in Neu-Granada; province of Pamplona near La Baja, at the height of 7000 feet—Schlim, 1197.

One of the finest species in the genus. Leaves ten inches long by two and a quarter broad. Raceme a foot long, loaded with as many as eighteen flowers, all expanded at the same time, and one and three quarters of an inch in diameter; brown, the petals bordered with yellow, the lip brown and yellow, the column white. Terrestrial.

Pescar. t. 47.

74. *ODONTOGLOSSUM BREVIFOLIUM* Lindl. in Benth. Pl. Hartweg. p. 152. L. F. N. 61:

O. foliis ovato-oblongis oblongisque patentibus, scapo simplici, bracteis oblongis membranaceis pedicellorum longitudine, sepalis subrotundis unguiculatis undulatis, petalis paulo minoribus, labello unguiculato auriculato cuneato emarginato sepalis brevioribus basi tuberculis verrucosis 5 et appendice parva antica 3-dentata aucto, clinandrio cucullato serrato in marginem membranaceum alaeformem decurrente.

Wild in Peru; on the Cordillera near Loxa; July—Hartweg.

Pseudobulbs ovate oblong compressed, one leaved. Leaves two inches broad, and sometimes not much longer. Flowers an inch and a half or more in diameter, eleven or twelve in a drooping raceme, apparently purple.

75. ODONTOGLOSSUM CHIRIQUENSE H. G. Reichenbach in Bot. Ztg. Oct. I. 1852.
L. F. Nr. 62:

O. sepalis oblongo-cuneatis obtusis crenulato-crispulis, petalis subaequalibus vix brevioribus supra basin brevissime cuneatam hastatis, labello ima basi cum columna parallelo trilobo lobis basilaribus triangulis margine postico curvilineis divaricatis lobo medio longe producto a cuneata basi dilatato antice rotundato crenulato undulato, crista oblonga paucicrenata inter lobos laterales cristulis inde in marginem anteriorem laciniarum lateralium transeuntibus, columna gracili; alis triangulis margine superiori denticulatis, clinandrii cucullo acutiusculo denticulato, lacinula triangula sub stigmatis labium inferum sistente.

Wild in Veragua; on the Cordillera of Chiriqui, at the height of 9000 feet, on decayed trunks; in October—Warszewicz.

Flowers as large as in *Oncidium crispum*. — Rehb. Pseudobulbs oval. Leaves in twos, large and green. Sepals brown. Petals and lip golden-yellow. — Warszewicz.

Rehb. fl. l. c.:

Perigonii phyllis externis oblongo-cuneatis, obtusis, crenulato-crispulis, lateralibus internis subaequalibus, vix brevioribus, supra basin brevissime et anguste cuneatam tamen obtuse hastatis, labello ima basi cum gynostemio parallelo, trilobo, lobis lateralibus basilaribus triangulis margine postico (et inferiori) curvilineis, divaricatis, lobo medio longe producto, a cuneata basi dilatato, antice rotundato, crenulato, undulato, lamina oblonga depressa paucicrenata erecta in basi inter utrumque lobum lateralem cristulis inde in marginem anteriorem (et superiorem) laciniarum lateralium transeuntibus, gynostemio inferne gracili, alis lateralibus triangulis, margine superiori denticulatis, androclinio postice cucullato, cucullo acutiusculo denticulato membranaceo, lacinula triangula sub fovea stigmatica labium inferum sistente.

Ich erhielt nur Blüten. Sie sind so gross, wie die des *Oncidium crispum*, denen sie entfernt ähnlich sind. Nächst *O. brevifolium* Lindl.! Letzteres hat um ein Drittheil kleinere Blüten, viel feinere Kerbzähne; die seitlichen, inneren Hüllblätter sind sitzend. Der Plan der Lippe und Säule ist völlig derselbe, aber diese hat nur kleine Oehrchen, ein kurzes, buckeliges Anhängsel. Das Zäpfchen unter der Narbenhöhle ist stumpf. — „Trugknollen oval. Zwei grosse, grüne Blätter. Innere Hüllblätter und Lippe goldgelb. Aeussere Hüllblätter braun. Cordilleren von Chiriqui. 9000'. Auf verfaulten Baumstämmen. October. v. Warszewicz.

76. ODONTOGLOSSUM ARMINII Rehb. fl. Bonpl. III. 66:

Simillimum *Odontoglossum coronario* Lindl., labelli auriculis falcatis acutis postice serrulatis, in margine antico papulosis, callo teretiusculo apice papuloso ante pedem gynostemii eidem semiadnato, gynostemio brevi crasso apice triptero, ala postica semirotonda denticulata, alis anticis quadratis, margine externo denticulatis.

Rhizoma repens. Pseudobulbi ovati ancipites monophylli. Folia cuneato-oblonga acuta subtus obscure violacea. Pedunculus apice racemosus. Bractee lanceolatae acutae ovarii pedicellatis quinquies breviores. Flores illis *O. coronarii* subdimidio majores. Sepalum summum cuneato-obovatum. Sepala lateralia cuneato-ovata minor. Tepala a basi cuneata lato rotundato cordata subpanduraeformia. Omnia haec organa crispula denticulata. Labelli lobus medius cuneato-flabellatus verosimiliter albus. Ocaña. März. 7000'. Wagener.

77. *ODONTOGLOSSUM PULCHELLUM* Bateman in Bot. Reg. 1841. t. 48; Bot. Mag t. 4104. L. F. Nr. 63:

O, pseudobulbis oblongis compressis ancipitibus diphyllis, foliis linearibus (vix semuncialibus pedalibus) apice oblique emarginatis, scapo foliis aequali ancipiti debili apice racemifero 6-7-floro, bracteis herbaceis linearibus acuminatis, sepalis ovatis acutis, petalis obovatis acutis subundulatis, labelli trilobi laciniis lateralibus triangularibus intermedia oblonga subquadrata apice recurva, callo baseos carnosio antrorsum hypoprepico retrorsum trilobo, columnae alis et clinandrio laceris.

Wild in Guatemala—Skinner.

The more striking features in this species are long thin pseudobulbs, very narrow grassy leaves, and a single protuberance at the base of the white lip. This protuberance is deep yellow spotted with crimson, very fleshy, firm and shining, and is almost horseshoe-shaped in front, while it is distinctly three-lobed behind, in consequence of two deep depressions.

78. *ODONTOGLOSSUM EGERTONI* Lindl. Bot. Reg. 1845. Misc. p. 50. L. F. Nr. 64:

O. scapo ancipiti, racemo secundo, bracteis herbaceis linearibus acuminatis ovario duplo brevioribus, sepalis petalisque ovatis acutis, labello acuto basi excavato dentibus duobus supra excavationem inflexis postice rotundato cordato, clinandrii lobis subintegris.

Wild in Guatemala?

This is known in gardens as a variety of *O. pulchellum*, than which it is smaller in all its parts, and from which it differs in the lip being quite acute, by no means hastate, nor almost truncate, and with an excavation at its base in lieu of the triple fleshy tubercle of *O. pulchellum*. Flowers pure white. Its native country is not certainly known.

79. *ODONTOGLOSSUM ROSEUM* Lindl. in Benth. Pl. Hartw. p. 151. L. F. Nr. 65:

O. foliis oblongo-lanceolatis racemo gracili duplo brevioribus, bracteis ovatis concavis subangulatis pedicellis duplo brevioribus, sepalis petalisque lanceolatis, labello trilobo basi bilamellato; lobis lateralibus nanis rotundatis intermedio obcuneato acuto, columna elongata apice alis 3 membranaceis integris aucta.

Wild in Peru; Quebrada de las Juntas; August—Hartweg.

Leaves from three to five inches long. Raceme about a span long. Flowers bright rose-colour, something less than an inch in diameter.

Species insufficiently known.

80. *ODONTOGLOSSUM GHIESBREGHTIANUM* Ach. Rich. in Annal. Sc., Jan. 1845 L. F. Nr. 67:

Pseudobulbis ovoideis compressis 3-phyllis; scapo pedali 3-6-floro; floribus luteis brunneo-maculatis: labello luteo, longe unguiculato, transverse orbiculari, emarginato, sepalis duplo longiori, ungue lineari basi hinc et illic obtuse auriculato, superne bi-cristato.

Mexico.

Ad *Odontoglossa* porro iudice Rchb. fil. pertinent haec genera:

Aspasia Lindl.

Gen. et Sp. Orch. p. 139.

Rchb. fil. Xen. I. pag. 82:

Genus *Odontoglossa* perquam affine: sepalis lateralibus ima cum labelli ungue coalitis (labelli ungue cum gynostemii parte inferiori extabulata connato), anthera per verticem tumore longitudinali connectivi (nunc et antice gibbere tumido) ornata, caudicula ligulata utrinque curvilinea.

Perigonium coriaceo carnosum. Sepala et tepala subaequalia (excepta *A. epidendroide*) lancea. Labelli unguis gynostemii marginibus anticis inferioribus adnatus, lamina plus minus pandurata nervis mediis basi incrassatis. Gynostemii pars libera clavata seu semiteres. Androclinium marginatum membrana humillima denticulata. Fovea magna subquadrata visco eleganter striolato. Pollinia pyriformia, postice fissa, plus minus cava sessilia in apice caudiculae linearis utrinque curvilineae. — Plantae habitu *Miltoniarum* pauciflorarum pseudobulbis valde compressis, floribus odoris, viscidis.

Clavis generis ex Rchb. fil. l. c.

- A. Labellum basi quam antice manifeste angustius, panduratum*). (Pedunculus longe exsertus). *A. lyrata* Rchb. fil.
 B. Labellum basi aequale seu latius.
 §. 1. Sepalum dorsale et tepala prope libera. Sepala extus supra nervum medium manifeste carinata *A. lunata* Lindl.
 §. 2. Sepalum dorsale et tepala dorso gynostemii basi manifeste adnata. Sepala extus supra nervum medium ecarinata.
 Sepala lanceolata:
 tumores velutini in basi labelli gemini *A. variegata* Lindl.
 tumores velutini in basi labelli nulli *A. Biberiana* Rchb. fil.
 Sepala oblongo ligulata:
 labellum sepalis lateralibus brevius obovatum *A. epidendroides* Lindl.
 labellum sepalis lateralibus aequale obtuse quadratum *A. principissa* Rchb. fil.

81. ODONTOGLOSSUM LUNATUM. Huc: Rchb. fil. Xen. I. p. 82: *A. lunata* Lindl. Bot. Reg. XXII. 1836. sub 1907:

Sepalis tepalisque lanceis acutis, subaequalibus, labello pandurato. Xen. p. 85:

Sepalo dorsali ac tepalis a gynostemio subliberis, sepalis nervo medio extus manifeste carinatis, sepalis tepalisque lanceis acutis subaequalibus, labello pandurato.

Aspasia lunata Lindl. Bot. Reg. XXII. 1836. sub 1907, XXX. 1840 Misc. 49-

Trophianthes zonatus Scheidweiler in Otto und Dietrich Allg. Gartenzeitung 1844. Nr. 28. p. 218.

Miltonia odorata Hort.

Aspasia epidendroides Hort. plurim. pertinacissime.

*) Character omnino insufficiens ad divellendum genus: sed cum de specie prope nihil compertum habeamus dira necessitate adlatum.

Rhizoma vaginis ovatis acutis persistentibus bene squamatum. Squamae in caulibus secundariis in folia ligulata acuta fulgentia abeuntes quaterna, quinterna. Pseudobulbus ovatus seu oblongus, valde compressus, bene anceps (ubi vetustus costatus, qui character nil valet, nisi de juvene pseudobulbo agitur) uni- — diphyllus. Folia illis aequalia papyracea. Racemus uni — seu biflorus ex axillis foliorum stipantium, vulgo tamen solitarius, et pseudobulbo quidem non evoluto. Peduncululus obtusissime trigonus. Bractee triangulae acuminatae carinatae ovario pedicellato multo breviores. Ovarium pedicellatum bene trigonum, viscosum. Sepala lineari lanceolata acuminata et dorso quidem supra nervum medium egregie carinata, carnosio pergamenae, viridia seu flaveola maculis liturisque transversis violaceopurpureis, intus excepto apice picta; nunc cum tepalis stellata, nunc lateralialia labello supposita; nunc labello subaequalia, nunc Brassiarum more adeo extensa, ut novam speciem videre putares. Tepala contextu, ambitu, colore aequalia, subbreviora, dorso ecarinata. Labellum panduratum antice bilobum, antrorsum dilatatum, minute denticulatum, angulis lateralibus gynostemii anticis adeo adnatum, ut limbo libero alae instar utrinque descendat, nervi medii ante basin paulo elevati; color albus fascia semilunari continua seu interrupta seu panduraeformi violacea, purpureave in disco. Gynostemii clavati androclinium membranula crassa denticulata marginatum. Antherae gibber in hac valde evolutus. — Brasilia.

Huc: *Trophianthes* Scheidw. in Allg. Gtztg. 1844. N. 28. p. 218:

Perigonii patentis foliola libera subaequalia, lanceolata, carinata. Labellum indivisum cum columna connatum. Columna erecta rostello fisso. Anthera —. Pollinia duo oblonga postice sulcata, glandula hamata. Ovarium arcuatum, triangulatum, antice canaliculatum.

Trophianthes zonatus Scheidw. l. c.:

Pseudobulbi caulescentes oblongi, compressi, vaginati. Scapus brevissimus vaginatus axillaris uniflorus. Sepala lateralialia recta, supremum naviculare apice triangulare, petala recurvata.

Labelli margines ad medium inflexi, lobus transversus emarginatus. Folia 3—4 pollices longa, 1 pollicem lata. Petala et sepala carnosae pallide viridia usque ad medium sanguineo maculata. Labellum candidum in medio roseo-zonatum. Stigma purpureum. — Patria Brasilia.

Lindl. Bot. Reg. XXII. 1836. sub 1907: *Aspasia lunata* Lindl.

Pseudobulbis oblongis compressis laevibus, sepalis petalisque linearibus obtusis patentissimis, labelli lobis lateralibus nanis, intermedio plano subquadrato undulato, floribus solitariis.

Brasilia, on the Cedrela district of Bananal. Descourtilz.

Sepala et petala luteo-viridia, sanguineo-maculata. Labellum album, macula lunata in medio. Flores inodori.

A variety of it is mentioned by Descourtilz with a pale lilac lip, the stain on which is deep violet. He also represents the pollenmasses as each furnished with a separate caudicula. If this is correct it will be an additional measure for doubting how far that character is of importance is distinguishing genera.

Bot. Reg. XXXII. 1844. Misc. 49:

We have received this curious Brazilian epiphyte from J. C. Lyons, Esq. of Ladiston near Mullinger, by whom it was obtained from the country about Rio. It has exactly the structure of the other *Aspasia*s, and not a double caudicula, as appeared from the drawing of Mr. Descourtilz, on which the species was founded. The flowers have long, narrowed sepals and petals yellowish blotched with brown; the lip is large and white, and is stained in the middle with pale purple, which had not, in the specimens sent us, that distinct crescent form from which the name has been derived. The anther has a large tumor in front, and a serrated sharp ridged crest, which gives the column much the appearance of a parrot's head.

Notul. Rchb. fl. :

Gynostemium ad medium cum labello connatum semiteres, cristae binae externae labelli baseos labelli ad margines gynostemii decurrentes. Androclinium marginatum membranaceum, subdenticulatum. Labelli trilobi margines crenulati, cristis 4 in medio, lobis lateralibus rotundatis, medio trapezoideo obtusangulo transverso antice emarginato. Anthera antice gibbosa, crista denticulata super antheram ipsam cavum gibbus (est plane cellulosa).

Rio Janeiro Binns. Flor. apud Hoffgg. Maj. 46.

82. ODONTOGLOSSUM VARIEGATUM. Huc: Rchb. fl. Xen. I, p. 83: *A. variegata* Ldl Bot. Reg. Tab. 1907:

Sepalis lanceolatis acutis, tepalis cuneato oblongis; labello basin versus obtuse trilobo, lobis obtusis crispulis lobulatis, lobo medio producto, tumoribus velutinis geminis in basi.

Hook. Bot. Mag. XII. N. S. 3679. *Aspasia interrupta* Hoffmgge. Verz. Orch. 1844 44. *Aspasia liturata* Link! in iconib. horti Schoeneb.!

Pseudobulbi ovati oblongive. Folia oblongo lanceolata supra pseudobulbos gemina. Pedunculi obtusissime trigoni uni- triflori. Bractee triangulae carinatae ovario trigono multo breviores. Sepala lineari lancea, lateralia paulo longiora, viridula seu flaveola lineolis atropurpureis atroviolaceisve interruptis notata. Tepala cuneata ligulata apicem versus dilatata, apice acuta venis omnibus atroviolaceo pictis. Label- lum supra basin gynostemio adnatum, trilobum; lobi laterales obtusanguli divaricati undulati, lobus medius semiovatus undulatus nunc bilobulus, nunc integer; discus subvelutinus; calli gemini velutini in basi, in carinulas exeuntes (ad vivam!) sulco interjecto; candidum, basi flaveolum purpureo guttulatum; nervi plurimi violaceopur- purei. Gynostemium clavatum, antice canaliculatum, velutinum; fovea semioblonga. Anthera pyriformis, vertice carinata. Vulgo floret pseudobulbo evoluta.

Primum in hortos Anglorum ex hortis Trinitatis insulae advecta. — Guyana Rob. Schomburgk 425! ibid. Pirara Rich. Schomburgk! Surinam Kegel! Ex ditioe flumi- nensi Brasiliae (Rio Janeiro) nuper magna copia in hortos Hamburgensium allata.

83. ODONTOGLOSSUM BIBERIANUM. Huc: Rchb. fl. Xen. I. p. 83: *Aspasia Biberiana* Rchb. fl. in Seemann Bonpl. II. 1. April 1854. 90:

Recedit a praecedenti labello profundius inserto aequaliter pandu- rato, basi et apice aequilato, tumoribus velutinis in basi deficientibus, nervis quaternis mediis basi carinatis. — Uniflora (an semper?).

Perigonium quam in praecedenti duplo triplove majus; viride unicolor excepto la- bello flavo concolori. Sepala oblongolanceolata; tepala cuneata oblonga acutiuscula. Labelium oblongo quadratum obtusangulum, apice profunde emarginatum, margine denticulatum. Praeter cristulas quaternas venae radiantes superadditae. Gynoste- mium rectum clavatum; margo androclinii leviter membranaceus postice apiculatus. Angulus in basi gynostemii valde prominulus. — Dicata domino Biber, mercatori Ham- burgensi ac Paraënsi, de Orchideis introducendis in hortos nostros optime merito. Ex ditioe Paraënsi.

84. ODONTOGLOSSUM ASPASIA. Huc: Rchb. fl. Xen. I. p. 83: *Aspasia epidendroides* Lindl. n. et Sp. Orch. 139:

Sepalis oblongo ligulatis obtuse acutis, tepalis latioribus obtusiori- bus concavis, labello sepalis lateralibus breviori obovato (nunc quadri- lobulo), crenulato, tumoribus velutinis in basi nullis. B. Mag. 3962.

Pseudobulbus saepe exacte circularis valde anceps et valde compressus, nunc ligu- latus(!). Folia oblongo ligulata — et fulgentia quoque optime evoluta. Pedunculus quam in reliquis (excepta *A. lyrata* Rchb. fl.) longior, pluriflorus (racemum undecim- vaginatum tenemus). Bractee ovatae acutae brevissimae; flores sicci nunc occur- runt cinnabarini more Brassiarum quarundam Miltoniarumque. Carinae in labelli

basi quaternae. Ex colore floris duos — si placebit — habebis typos: altera pollet sepalis extus atroviolaceis, viridi irroratis, intus olivaceoviridibus, obscure atroviolaceo fasciato maculatis; tepalis concoloribus violaceis; labelli candidi disco purpureo-violaceo. Altera contra — et vulgo quidem minor — multo pallidior, tepalis pallidissime lilacinis, demum sordide flavidis. Haec nobis omnino videtur: *Aspasia fragrans* Klotzsch Ind. Semin. Berol. 1853. 12. Addimus quidem descriptionem ill. viri, sed eheu! ne vestigium quidem characteris reperimus, quod forsani ipsi ill. fautori accidit, qui alias diagnosin non omisisset. Hanc varietatem obtinimus ex hortis. — Vulgo florēt pseudobulbo evoluto.

Crescit in America vere centrali: Veraguas: Hinds! Costa Rica, Veraguas, Guatemala, Chiriqui (ubi vulgatissima 2000' Novembri) J. v. Warszewicz! Ex Nicaragua attulerunt in hortum schol. Med. Parisiensem. S. Baranka Costaricae Oersted!

Obs. En descriptio Klotzschiana *Aspasiae fragrantis* ex l. l. recepta:

„Pseudobulbis oblongis valde compressis sulcatis ancipitibus, apice emarginatis, diphyllis; foliis lanceolatis acuminatis papyraceis, basi conduplicatis, apice latiuscule recurvis, dorso longitudinaliter anguste carinatis; racemo brevi basilari trifloro; perigonii foliolis exterioribus luteis, maculis sordide fusciscentibus pallidis magnis dense fasciatis, dorsali patenti erecto apice bidentato*), lateralibus revolutis, interioribus dilutissime lilacinis, deinde sordide flavidis, oblongis, dorso convexis, cucullato-acutis erectis subbrevioribus; labello subintegro cordato-ovato obtuso candido violaceo-maculato, versus apicem denticulato, basi utrinque rectangulo, taeniis geminis integris a basi usque ad medium; gynostemio recto robusto sordide albido demum flavido.“

„Pseudobulbus valde compressus, 2½ pollices longus, 16 lineas latus. Folia papyracea, inaequilonga, minora 5½ pollices longa, 15 lineas lata, majora 8 pollices longa et 1½ pollices lata. Racemus crassitudine pennae columbinae, 2½ pollices longus. Perigonii foliola subaequalia, 10 lineas longa, 3—4 lineas lata. Labellum 7 lineas longum, ad basin 7, versus apicem 5—6 lineas latum.“

„Patria? Floruit in horto botanico Berolinensi M. Junio 1853.“

85. ODONTOGLOSSUM PRINCIPISSA. Huc: Rchb. fl. Xen. I. p. 84: *Aspasia principissa* Rchb. fl. in v. Mohl und v. Schlechtend. Bot. Ztg. X. 1852. 637.

Priori affinis, omnium maxima, labello obtuse quadrato apice bilobulo, sepalis lateralibus aequilongo, gynostemio arcuato gracillimo.

Habitus et organa vegetativa praecedentis. Sepala et tepala carneo brunnea; labello flavum striis radiantibus brunneis; umbo in gynostemii basi magnus; carinae labelli geminae in basi valde elevatae.

Veraguas Maio et Junio rarissima. J. de Warszewicz! (Habeo spec. sicc.). (Dicatur exstare in horto Allardt Berol.)

Species obscura, egregia.

86. ODONTOGLOSSUM LYRATUM. Huc: Rchb. fl. Xen. I. p. 84: *Aspasia lyrata* Rchb. fl. I. c. 721:

Pedunculo tenui supra folia obovato ligulata longe exserto, labello panduraeformi basi quam antice multo angustiore, obtuse acuto.

Epidendrum lyratum Fl. Flum. IX. 37. (1827).

Icon profert pseudobulbos pyriformes apice bene angustatos (costatos?), fere quinque pollices longos, supra basin duos latos; diphyllis; folia subaequilonga. Pedunculus ultra pedatis. Perigonium illi A. lunatae duplo minus. Sepala et tepala aequalia lanceolata acuta, intus et extus basi zonulis quibusdam obscuris notata.

*) Quod certe aut monstrose, aut adeo minute, ut vix commemorando dignum.

87. ODONTOGLOSSUM COCHLIODA. Huc: *Cochlioda* Lindl. Fol. I. „Feb. 21. 1853.“

Sepala petaloidea, patentissima, libera; lateralibus angustioribus labello suppositis. Petala tenera, patentissima, sepalo dorsali aequalia. Labellum tenerum, 3-partitum, ad medium usque columnae connatum, decurrens: callis 2 linearibus apice verticaliter bivalvibus (cochleae ad instar) sub anthera. Columna arcuata, elongata, apice auriculata; clinandrio cucullato. Pollinia 2, oblonga, solida; caudicula rhombeo-ovali; glandula oblonga parum majore. Herba epiphyta, Peruviana, pseudobulbosa. Folia coriacea. Racemus radicalis, densiflorus; pedunculo squamato, bracteis glumaceis. Flores conspicui.

The habit of this plant is that of *Odontoglossum*; the lip and column would refer it to *Epidendrum*; the pollen-masses and caudicle are such as we find in no neighbouring genus. The calli on the lip, placed just in front of the anther, are narrow, raised, and fleshy, and each is furnished at the point with a bivalve gland which opens vertically. The two narrow lateral sepals, standing apart from the others and beneath the lip, indicate an unmistakable affinity with *Oncidium*.

Cochlioda densiflora.

Wild in Peru—Matthews.

Pseudobulb oval, two-edged, something like that of *Oncidium tenue*, with one narrow coriaceous spreading leaf at the point, and a pair of smaller and more channelled ones at the base. Peduncle about as thick as a crowquill, five inches long before reaching the flowers, clothed through its entire length with close-pressed glumaceous sheaths. Raceme oblong, rather more than three inches long. Bracts glumaceous, cucullate, spreading, about as long as the ovary. Back sepals and petals roundish, acute, of the same size; lateral sepals spatulate-oblong, acute, nearly parallel. Lip three-lobed; lateral lobes roundish, middle one linear-oblong, dilated and two-lobed at the point. In their dried state the flowers are about one inch and a quarter across; their colour is unknown; it seems to have been yellowish, or white, and unspotted.

88. ODONTOGLOSSUM RECURVUM. Huc: *Gomezia recurva* R. Br. Bot. Mag. 1748. *Rodriguezia recurva* Lindl. Hort. Trans. VII. 67. L. O. 195.

89. ODONTOGLOSSUM PLANIFOLIUM. Huc: *Gomezia planifolia* Klotzsch Rchb. fl. in v. Schl. und v. Mohl Bot. Ztg. 1852. 772.

90. ODONTOGLOSSUM LAXIFLORUM. Huc: *Gomezia laxiflora* Klotzsch Rchb. fl. l. c. *Rodriguezia laxiflora* Lindl. Bot. Reg. XXV. 1837. Misc. 139.

Pseudobulbis ancipitibus ovalibus, foliis lineari-lanceolatis acutissimis, racemo laxo cernuo, bracteis ovaria subaequantibus, labelli recurvi obsolete bicristati appendice ungui aequali, sepalo antico angusto cuneato bifido postico petalisque planis.

I received it 1834 from Mr. Bateman, who first distinguished it from *R. planifolia* and *recurva*. Organ mountains of Brazil Gardner 654. Recently in the coll. of Loddiges. Palegreen flowered. Much smaller than those just mentioned, with a very lax nodding spike, on which the flowers are generally arranged at considerable intervals, not always however, for I have spec. with the inflorescence as compact as that of *R. secunda*.

91. ODONTOGLOSSUM CRISPATULUM. Huc: *Gomezia crispa* Klotzsch Rchb. fl. l. c. Huc: *Rodriguezia crispa* Lindl. Bot. Reg. XXV. 1839. Misc. 139.

Sepalis omnibus liberis petalisque undulato-crispis, labelli bicristati appendice ungue multo breviorē.

This is the finest of the green flowered species and is remarkable for the crisp appearance of its flowers, which are sea green bordered with yellow. Their fragrance is delicious, resembling that of Primroses. Brazil.

Bot. Reg. XXVI. 1840. 54:

Pseudobulbis ovatis elongatis compressis, diphyllis, foliis oblongolanceolatis patentibus undulatis, racemo elongato dorso pyramidato nutante.

Organ mountains.

Evidently near *R. suaveolens*, the *Pleurothallis foliosa* of Bot. Mag. t. 2746, a plant I have never seen. But according to the fig. and descript. the two lateral sepals of that species, are united at the base, and the flowers are very little crisped. — *Perigonium viridi flavum.*

92. ODONTOGLOSSUM FOLIOSUM. Huc: *Gomezia foliosa* Klotzsch Rehb. fl. l. c. *Rodriguezia suaveolens* Lindl. Orch. 195. *Pleurothallis foliosa* Hook. Bot. Mag. 2746.

93. ODONTOGLOSSUM BARKERI. Huc: *Rodriguezia Barkeri* Hook. Bot. Mag. 3497:

Bulbis ancipitibus compressis oblongis, foliis linearilanceolatis nervis laevibus, perianthio undulato, sepalo inferiori (duobus formato) fere ad medium bifido, segmentis patentibus, labello apice integro.

A Brazilian plant, imported from Brazil by George Barker, Esq. of Birmingham, and communicated to us in full flower Jan. 36 by Mr. Cameron of the Birmingham Bot Garden. — It is in many respects allied to the *Gomezia* (*Rodriguezia* Lindl.) *recurva* of Bot. Mag. t. 1748, and to the plant of the same name in Bot. Cab. t. 660. (*Rodriguezia planifolia* Lindl.). From the former it differs in the smooth, not striated and plaited leaves; and from both, as well as from *R. suaveolens* Lindl. (*Pleuroth. foliosa* Hook. B. M. 2746) by the very deep division and consequently long segments, which are spreading, of the lower (combined) sepal. The whole flower too, is of a uniforme pale green colour, nearly destitute of fragrance.

1466. 1/. **BRACHTIA** Rehb. fl.

Linnaea XXII. 853. Walp. Ann. III. p. 561.

Rehb. fl. Bonpl. II. 14:

Perigonium carnosum, clausum; sepala oblongolanceolata acuta, dorso longitudinaliter carinata, tepala ovata acuta ecarinata. Labellum obovatum seu panduratum, retusiusculum seu bilobulum, basi excavatum, carinulatum callis carnosae carinatis duobus a basi medium usque, antice et basi liberrimis, medio connatis (uti x littera), gynostemio brevi semitereti antice canaliculato, in pedem alatum producto, basi cum sepalorum tepalorumque basi connato, cum labello apici gynostemii parallelo arthrofi nec articulatione junctum, rostellari processu bidentato correcto, fovea stigmatica supposita parva. Anthera mitrata, dorso carinata. Pollinia globosa postice sulcata, in lamina oblonga sessilia (ad B. glumaceam).

Diess Alles nach neuen Blüten der *B. glumacea*, nur die Anthere und Pollinia entlehne ich meiner früheren Zeichnung. Eigenthümlich erscheint mir vor Allem die Vereinigung der Hüllblätter und Säule am Grunde. Der Fruchtknoten erweitert sich also in einen kegelförmigen Körper von etwa $\frac{1}{2}$ Linie Länge, dann werden die Organe frei. Das Mentum führt die Gattung den Maxillarien zu, die Tracht ist die einer *Brassia*. Herr Wagener hat die sogenannte *Brassia pumila* bei Herrn Linden gesehen und versichert, die Aehnlichkeit der Pflanzen wäre gross.

Rehb. fl. Xen. I. p. 114:

Genus Mesospindio quodammodo affine, nec Brassiæ admodum alienum labello basi gutturoso, sepals lateralibus basi connatis saccatis suppositis, gynostemii processu rostellari canaliformi, polliniis pyriformibus cavis postice fissis in caudicula curvata.

Perigonium carnosum clausum. Sepala subaequalia, lanceolata, carinata, lateralia basi connata, gibberem efformantia. Tepala subaequalia, tamen extus non carinata et latiora. Labellum a basi angustiori ovatum apiculatum, carnosum, basi saccatum, disco callosum; ante basin utrinque gynostemio accretum. Gynostemium crassum utrinque membranaceum marginatum. Androclinium ascendens, bicameratum. Rostellum utrinque retusum; medio lamina canaliculata, vexillo quasi, auctum pro caudicula recipienda. Anthera dorso carinato cristata ovata apice apiculata. Pollinia pyriformia, cava, postice fissa, sessilia in caudicula curvula oblongo-quadrata, seu cordata, basi glandulam triangulam seu oblongam gerente. Fovea subquadrata transversa, basi limbo prominulo angulato cincta.

1. BRACHTIA GLUMACEA. Rehb. fl. Linn. l. c. Walp. l. c. Rehb. fl. Bonpl. II. 14:

Humilis, pseudobulbis ancipitibus oblongis monophyllis, foliis oblongis apice obtuso inaequalibus vernixiis, 4—5 pollices longis, foliis stipantibus inferioribus squamaeformibus, superioribus illis subaequalibus, pedunculo infralbuli 4—6 pollicari, ex folio stipante axillari, erecto, foliis brevioribus nunc aequali, longiori, paucifloro, medio univaginato, apice flexuoso spicato, bracteis ovatis acutis scariosis glumaceis flores subaequantibus, labello apice obtuso. Die röthlichgelben Blüten im getrockneten Zustand halb so gross als die eines lebenden Scelochilus Ottonis. Die Tepala doppelt so breit als Sepala. Merida. (*Oncodia glumacea* Lindl. Fol.). W^agener.

Huc: *Oncodia* Lindl. Fol. I. Part. IV. April 1853:

Sepala erecta, costata, herbacea: lateralibus paulo obliquis, ovarii mento adnatis. Petala membranacea, latiora. Labellum membranaceum, indivisum, erectum, cum cavitate carnosam in ovarii apice mentiformi continuum, basi foveatum et bilamellatum. Columna brevis, erecta, aptera; margine membranaceo versus basin latiore. Ovarium ad columnae labellique junctionem in cavitatem carnosam mentiformem (cuniculum) dilatatum. Pollinia 2, ovalia, solida; caudicula lata lineari; glandula oblonga. Anthera apiculo recurvo. Herba epiphyta, Americae tropicae, pseudobulbosa. Folia coriacea. Racemi radicales. Bracteeae glumaceae.

In habit this resembles somewhat such plants as *Brassia glumacea*; but in structure it is extremely different. The small flowers, hidden within the bracts, have an anterior hollow tumour, like a goitre, arising from the top of the ovary, and answering to the cuniculus so common in *Epidendrum*. On the edge of the cavity of this tumour stand the lip and the pair of lateral sepals, which are widened on one side at the base so as to accommodate themselves to the form of the tumour. The column is exactly that of *Brassia*, to which the genus is nearly related.

Oncodia glumacea Lindl. Fol. l. c.

Wild in New-Granada—Funck and Schlim. 1499.

Pseudobulb narrow, two-edged, one-leaved. Leaf coriaceous, somewhat shining, linear-oblong, obtuse, channelled at the base and greatly narrowed. Peduncle erect, about as long as the leaf, terete, with an adpressed sheath near the middle, and another half way between it and the spike. The latter short, distichous, imbricated, with cucullate blunt glumaceous bracts, which are longer than the flowers. The sepals are narrowly triangular, with a sharp central rib. Petals twice as broad, roundish oblong, apiculate. Lip of the same form as the petals, with a pair of deep stout diverging plates near the base, between which, next the cavity or chin, is a small pit clothed with hairs.

Rchb. fl. Xenia I. p. 76. Tab. 29. II. 1—12:

Bracteis ovatis acutis, labello antice ovali apiculato disco calloso depresso quadrato unoquoque margine sinuato, postice velutino.

Planta statura valde varians: tripollicaris — ultra pedalis. Pseudobulbi ancipites oblongi monophylli. Folia oblongo ligulata apice obtuso inaequalia, vernixia, 3—5 pollices longa, nunc pedalia. Folia stipantia inferiora squamaeformia, vaginarum margine tenui membranaceo eleganter transverse plicatulo. Pedunculus infrabulbis nunc subnudus, nunc plurivaginat. Vaginae scariosae ancipites apice acutae. Bractee scariosae ovatae acutae cucullatae flores erectos (in sicca) cinnamomeos subaequantes. Perigonium supra descriptum, bene carnosum. Labellum margine nunc crenulatum; apice apiculatum. v. Warscewicz.

2. BRACHTIA SULPHUREA Rchb. fil. in Seemann Bonpl. II. 1854. 14:

Pseudobulbis ovatis ancipitibus, foliis oblongolanceolatis acutis summis subpedalibus, pedunculo gracilento subpedali trivaginato, apice spicato multifloro, inflexo, bracteis lanceolatis acutis floribus sulphureis longioribus, labello apice acuto.

Merida 5000'. Jan. 1853. Wagener.

Rchb. fl. Xenia I. p. 75. Tab. 29. I.

3. BRACHTIA ANDINA Rchb. fil. Bonplandia IV. 322.

1466². **MESOSPINIDIUM** Rchb. fil.

In v. Mohl und v. Schlechtendal Bot. Ztg. X. 1852. p. 929.

Rchb. fl. Xenia Orchid. I. 36:

Genus *Odontoglossum* Hb. B. Kth. inter et *Brachtiam* Rchb. fil. (*Oncodiam* Lindl.): ab utroque valde diversum rostello, limbo androclinii descendente, labello, mento spurio, gynostemio antice foveato, pollinario.

Perigonium subcarnosum, clausum. Sepalum summum lanceolatum, sepala lateralia connata, apice bifida, lacinia utraque lancea, basi subsaccata, labello, supposita; tepala triangulo lanceolata acuta, sepalis basi vix imbricantibus. Labellum cuneatum obcordatum limbo revoluto, carinae duae unguem marginales eboraceae nunc antice lobatae canalem velutinum inter se linquentes, lamella biloba depressa anteposita; subimmobile. Gynostemium semiteres, antice profunde excavatum. Androclinii limbus utrinque descendens, rostellum ascendens acuto triangulum bicuspidatum. Anthera depresso mitrata unilocularis antice retusa medio cuspidata. Pollinia globosa, postice minute perforata. Caudicula linearis basi latior; glandula lancea.

1. **MESOSPINIDIUM WARSCEWICZII** Rchb. fil. Xen. I. Tab. 16. I. 1—11. et l. c.:

Planta satis mira ob mentum spurium. Gynostemium enim in pedem non est productum, unde de vero mento sermo non fieri potest. Sed cum latera illius organa sint omnino protracta, effectus est idem ut perigonii phylla lateralia externa non sint super ovarium ipsum sed pone illud inserta. Folium basi breviter cuneatum oblongo lanceolatum acutum pergamenum. Flores illis *Oncidii umbrosi* Rchb. fil. subaequales, olivacei, purpureo guttati. Labelli cuneus albidus, limbus flaveolus purpureo guttatus, lamella biloba flaveola. — Habitus *Odontoglossorum* e Sect. *Myanthiorum* fid. Equite Kramer.

2. **MESOSPINIDIUM RADIATUM** Rchb. fil. Mss. *Abola* Lindl. Fol. I. April 1853:

Sepala subcoriacea, patentia; lateralibus connatis, labello suppositis. Petala membranacea, conformia. Labellum liberum, sessile, columnam amplectens, basi dilatatum, indivisum, membranaceum; callo triplici

carnosum. Columna nana, membranaceo-marginata; clinandrium marginato. Pollinia 2, oblonga; caudicula brevi, tenui; glandula minuta. Anthera subrotunda, ecristata. Herba epiphyta, Americae tropicae, ebulbis, acaulis. Folia pauca, coriacea. Flores parvi, racemosi; pedunculo radicali.

This curious little plant must be regarded as an ally of *Oncidium* and *Odontoglossum*, from both which, as well as their allies *Brassia* and *Miltonia*, it is distinguished by an extremely slender, delicate caudicle, minute circular gland, and solid pollen-masses. The column too forces down the sessile lip by its thin projecting edges, which thus rest upon the lip and partially surround the calli.

Abola radiata Lindl. Fol. l. c.:

Wild in Neu-Granada; in the province of Pamplona; at the height of 9500 feet; Schlim, 111.

The whole plant about five inches high. Leaves coriaceous, channelled, sessile, the uppermost not half the length of the raceme and perfect, the next imperfect, the remainder merely cartilaginous scales, from among which rises the scape, consisting of seven or eight small distant flowers seated on a flexuose rachis, with short cucullate striated acute bracts. The sepals seem to be rather coriaceous; the lateral separate only at the point. Petals linear-ovate, acute. Lip circular at the base, then contracted into a linear retuse upper half. Of the triple callus the middle is erect, the sides smaller and projecting. („Flowers brown with yellow rays. Column and lip white.“ — Schlim.)

3. *MESOSPINIDIUM AURANTIACUM* Rehb. fl. Mss. *Ada* Lindl. Fol. l. Febr. 1854:

Perianthium clausum, apice patulum. Sepala subaequalia, acuminata; lateralibus basi paulo obliquis. Petala conformia breviora. Labellum elongatum, indivisum, c. columna parallelum, eique basi adnatum; lamellis 2, membranaceis, in appendicem linearem truncatum connatis. Columna aptera, caeterum *Oncidii*, basi convexum dilatatum et marginatum. Stigma excavatum. Pollinia 2, cereacea, postice sulcata; caudicula brevi, obovata; glandula circulari. Anthera *Oncidii*, ecristata. Herba epiphyta, Americae tropicae, habitu omnino *Brassiae* cujusdam *glumaceae*. Scapus bisquamatus. Spica cylindracea, simplex, bracteis membranaceis. Flores xanthini.

This is a remarkable plant, with brilliant orange-coloured flowers collected in a close raceme enveloped in thin cucullate membranous bracts, and never opening except at their point. The leaf is about six inches long, narrow, and channelled; rather shorter than the scape, which bears two distant membranous sheaths. Mr. Linden referred it to *Brassia*; from which, however, it differs in some important particulars: — 1, the lamellae of the lip are confluent and membranous; 2, the lip is parallel with the column and solidly united to the base of it; 3, the column is twice as long as in other *Brassias*, and thin-edged at the base; 4, the caudicle is short and obovate, while the gland is circular. For this reason I place it at the end of the *glumaceous Brassias*. Possibly it may be related to Rehb.'s genus *Brachia*, a plant of which I have no knowledge.

Ada aurantiaca Lindl. Fol. l. c.:

Folium canaliculatum. Scapus longior bisquamatus. Bracteeae cucullatae membranaceae ovarii subsessilibus multo longiores. Flores apice tantum patuli, sepalis petalisque lineari-lanceolatis acuminatis. Labellum lineari-lanceolatum acutissimum convexum columnae elongatae basi adnatum; lamellis membranaceis connatis apice truncatis acutis basi intus pubescentibus.

Wild in New-Granada; in the province of Pamplona, at the height of 8500 feet above the sea—Schlim, 121.

4. MESOSPINIIDIUM CINNABARINUM Rehb. fl. Mss. Huc: *Brassia cinnabarina* Linden cf. supra sub *Oncidiis* p. 770.

5. MESOSPINIIDIUM SANGUINEUM Rehb. fl. Mss.:

Pseudobulbo ovali compresso, diphylo, folio uno stipante, foliis omnibus cuneato ligulatis acutis, racemo secundo (?semper), bracteis squamaeformibus minutis, sepalis oblongis acutis, lateralibus medium versus bifidis, tepalis cuneato ovato acutis, labello ligulato acuto, lateralibus erectis, carina lineari per disci basin superiorem apice, sc. medio labello divergenti bicurvi, androclinio minute lobulato.

Pseudobulbi viriduli punctis atropureis. Pedunculus et ovaria pedicellata violacea. Perigonia sanguinea, illis *Rodrigueziae* secundae aequalia.

Peru: Maranon Warscewicz! Quito. Jamieson!

1466³. SIGMATOSTALIX Rehb. fl.

In v. Mohl und v. Schl. B. Ztg. 1852. 769.

Perigonii phylla lanceolata acuta subaequalia. Labellum unguiculatum, dein semiellipticum, subito angulato-dilatatum, antice emarginatum, excavatum, membrana semicirculari antice aperta, postice angulato inflexa in disco baseos semiellipticae, carina erecta trapezoidea superne sulcata longitudinali in media illa lunula. Gynostemium gracillimum, sigmoideum, apice clavato in alas oblongas pone foveam stigmaticam productum. Androclinium elevatum, ascendens, submarginatum, antice angulatum, apice bidenticulatum, postice angulatum. Anthera mitrata. Pollinia duo oblonga, depressa. Caudicula —. Glandula —.

Planta habitu *Odontoglossi* cujusdam imminuti. Folia angustissime linearia, acuta. Pseudobulbi oblongi, apice attenuati, compressi. Pedunculi axillares in foliis pseudobulbos fulcientibus, basi nudi, apice 2—4-flori; capillares. Bracteeae ochreae, acutae, flores illos *Pleurothallidis* pictae vix attingentes.

Rehb. fl. Xen. I. p. 19:

Aff. *Rodrigueziae* gynostemio arcuato gracili apice utrinque producto oblongo auriculato, rostello triangulo bidentatulo ascendente, labello unguiculato basi gyroso calloso. Perigonii phylla lanceolata acuta subaequalia. Labellum unguiculatum dein utrinque humeratum angustum subito in trapezoideum obtusangulum antice emarginatum, antrorsum angustatum; excavatum. Carinula hippocrepica in basi, interjecta carina sulcata; apiculo postico. Gynostemium gracillimum arcuatum apice clavato in auriculas oblongas pone foveam stigmaticam productum. Androclinium ascendens, submarginatum, postice apiculatum, rostellum triangulum, minute bidentatum. Anthera mitrata. Pollinia duo oblonga, depressa. Caudicula —. Glandula —.

1. SIGMATOSTALIX GRAMINEA Rehb. fl. l. c. *Specklinia graminea* Pöpp. Endl. I. 89. b. „1007. Stelideae. Cuchero Peruv. 1829. Pöppig.“ Blüthe scheint goldgelb, am Grunde braun. Ich hatte nur 2 reife Knospen zur Verfügung, glaube aber Alles

richtig gesehen zu haben, nur dass mir unter solchen Verhältnissen der Winkel fehlt, den die Lippe zur Säule macht. — Die Stellung der Pflanze im System ist mir zweifelhaft. Die Säule hat einige Verwandtschaft mit der gewisser *Odontoglossa*, das *Androclinium* wie bei *Rodriguezia*. Die genagelte Lippe ist in dieser Verwandtschaft selten. Immerhin konnte ich nur 2 Pollenmassen finden. — Die *Rodriguezia cochlearis* Lindl. scheint mir nach der Beschreibung als zweite Art hierher zu gehören. Ich finde sie nicht unter den Massen von Orchideen, die mir vorliegen.

Xenia I. Tab. 8. III. 11—17. p. 20:

Plantula tenuis, pusilla. Caulis primarius dense squamatus ac rhizophorus. Pseudobulbi lineari oblongi basi a vaginis foliorum delapsorum margine membranaceo undulatis stipati, apice monophylli. Laminae lineari lanceolatae acutae. Pedunculi capillares in axillis foliorum suppositorum, apice racemose paniculati. Adsunt enim in spatharum axillis ramuli abbreviati tribracteati. Bracteae an omnes sint fertiles, an infirma fatua, non dijudicabo, cum flores deciderint.

2. SIGMATOSTALIX PICTA:

Racemo pendulo, sepalis tepalisque oblongis acuminatis, labello ungue canaliculato in laminam transversam subreniformi triangularem obtusam expanso, angulis posticis utrinque calcula introrsa ornatis, callo bicorni retrospectante, antice obtusato in basi hujus laminae, columna gracillima, apice dilatata, ima basi annulo prosilienti cincto, rostello elongato, lineari.

Flores pallidi purpureo picti. Tepala vulgo latiora quam sepal. Caudicula supra medium valde dilatata. Anthera antrorsum acuta. Quito. Jamieson.

3. SIGMATOSTALIX RADICANS:

Rhizomate valde radicante, pseudobulbis oblongoligulatis, foliis cuneato lineariligulatis acutis, geminis, foliis stipantibus 2—4, racemo elongato, usque undecimfloro, sepalis tepalisque cuneato oblongis acutis, labelli ungue tuberculis duobus deinceps positus onusto, lamina transversa sagittato ovato apice acuto uni-, bi-, trilobulata, callis triangulis 4—6 sex, uni-, seu biseriatis.

Flores viriduli flavidi. Columna antice valde violaceopurpurea. Brasilia, Rio grande. Porto Allegro.

1466⁴. MEIRACYLLIUM *Rchb. fil.*

Xen. I. p. 12.

Novum genus Vandearum nulli affine, habitu quodammodo *Sophranitidis*, labello calceolato apiculato more *Sarcochili* inserto, gynostemii androclinio bivalvi ab omnibus longe diversum. — Perigonium subcarnosum clausum; sepalum summum lanceolatum obovatum acutum; sepala lateralia triangula acuta; tepala cuneato ovata acuta. Labellum calceolare, gynostemio linea semilunari accretum, supra basin utrinque unidentatum, apice attenuata acutum. Gynostemium tereliusculum obliquum; androclinium a dorso valva semicirculari nunc bilobula tectum, immersum, antice in rostellum lineare rostriforme apice obtusatum seu bidentatum productum; fovea stigmatica in pagina rostelli inferiori, basi sua sinu obtuse triangulo insiliente notatum. Anthera oblonga antice rostrato attenuata, retusa, bilocularis. Pollinarium —.

1. MEIRACYLLIUM TRINASUTUM *Rchb. fil. l. c. et Tab. 6. II. 8—12:*

Caulis primarius calamum anserinum prope crassus, tortus, vaginis hyalinis apice triangulis obscuro colore transverse vittatis, radices adventitias obtuse flexuosas undique promens. Caules secundarii brevissimi uno internodio constituti a vaginis plane

absconditi, cicatrix insertionis folii semilunata. Folia crassissima, prope circularia, marginata, sicca juniora bene nervosa cum nervulis transversis aequè validis; adulta contra crassissima, transverse rugosa, inferne cutis rhinocerotinae instar rugis sulcisque quaquaversis arata, sulcata, tessellata. Pedunculi brevissimi, crassi. (ancipites?) supra basin bene articulati, dein calloso excisi pro bracteis minutissimis acutus ac pedicellis recipiendis. Ovaria pedicellata perigonis longiora. Flores supra descripti, verosimiliter lilacini.

1469. **PHALAEOPSIS** Blume.

Bijdr. 294. Tab. 44. Walp. Ann. I. 790. III. 561.

1. **PHALAEOPSIS DELICIOSA** Rehb. fil. Bonpl. II. 93:

Aff. *P. equestri* Rehb. fil. (roseae Lindl.): gracillima, pedunculo sex-pollicari, floribus paulo minoribus, sepalis tepalisque ovatis obtusis subaequalibus, labelli trifidi segmentis lateralibus ligulatis, medio obtuse rhombeo, callo depresso antice bicorni seu forcipato in unguem lobi medii, gynostemio humili.

2. **PHALAEOPSIS EQUESTRIS** Rehb. fil. Linn. XXII, 864. Walp. Ann. III. 562. (sub *P. rosea* Lindl.) Lem. I. c. 283. G. Chron. 1848. 671. Fl. G. 173. Pl. 72.

3. **PHALAEOPSIS INTERMEDIA** Lindl. in Paxt. Fl. G. III. 163. c. xyl.:

Petalis lato rhombeis acutis, labelli lobis lateralibus cuneatis obtusangulis intermedio ovato apice bicirrhoso.

Flowers white and deep rose. Veitch & Co. Natural mule between *P. amabilis* and *rosea*. Agrees with former in foliage and in the tendrils of the lip; with the latter in colour, in the acuteness of its petals and in the peculiar form of the middle lobe of the lip. The short description will enable it to be easily recognised. Axis of inflorescence deep brown rich purple, bearing flowers half way in the size between *P. amabilis* and *rosea*. Sepals pure white, concave, oblong acute. Petals much larger, lozenge shaped, acute, pure white with a few minute speckles at the base. Lip three-lobed, lateral divisions erect, wedgeshaped, with rounded angles, violet with a few crimson spots and dots. The middle division ovate, deep crimson, with the point separated into two short tendrils. Crest at the junction of the lobes of the lip nearly square, depressed in the middle, deep yellow with crimson dots.

4. **PHALAEOPSIS CORNU CERVI** Bl. et Rehb. fil. in Otto Hamb. Gartenztg. 1860. 161. Lindl. Folia I. Febr. 1854: *Polychilos* Kuhl and Hasselt, Genera et Sp., Orchid. et Aselep. (1827):

Sepala explanata, carnosae, angusta, libera; lateralibus subfalcatis, leviter incurvis. Petala conformia, minora. Labellum posticum, unguiculatum, in disco foveatum, cum columna continuo, carnosum, complicatum, tripartitum, laciniis lateralibus apice runcinatis, terminali lunato apiculato. Appendix circa foveam membranaceus, semicyathiformis, 5-aristatus, dentibus duobus auctus: altero minore a latere columnae, antico cultrato. Columna erecta, elongata, semiteres, basi bituberculata, clinandrio proclivi, rostello elongato decurvo. Stigma oblongum, excavatum. Pollinia 2, cereacea, postice fissa; caudicula elongata, obovata; glandula ovali. Anthera . . . Herba epiphyta, Asiae tropicae, caulescens. Folia coriacea, disticha. Pedunculus lateralis, erectus, multiflorus; rachi alata.

A remarkable genus, with the habit of the winged *Aerides*, for which the name *Dendrocolla* may be retained, but with a different lip, the appendix of which is a much more complex organ, and with a long narrow column. Perhaps it ought to be combined with *Phalaenopsis*, the sole distinctions between which and *Polychilos* consist in the foveated lip and complicated appendix of the latter.

Polychilos cornu-cervi Kuhl and Hasselt, l. c.:

Wild in Java — on the west side, in the province of Bantam—K. and H., T. Lobb ; Moulmein—Id.

A distichous-leaved plant, with coriaceous oblong leaves narrowed considerably to the base, where they are very fleshy. The peduncles, which are opposite the leaves and longer, terminate in a broad-winged toothed rachis, which is usually a little branched. The flowers are reddish yellow, not quite two inches across, a little speckled in lines with a deeper red. It appears that only two or three open at a time.

Die Inflorescenz scheint terminal, allein von der Achsel des zweitunteren Blattes entwickelt sich dann der neue Spross, der mit einer ungeheuern Luftwurzel ausgerüstet den ältern überwächst. Caracas. 6000'. Juni. Wagener. — Walp. III. 562.

8. *TELIPOGON FALCATUS* Lindl., Rehb. fl. Bonpl. II. 280:

Tepalis falcatis, labello cordato acuto.

Folia ensiformia utrinque attenuata apice acuta. Pedunculus anceps dense acuteque vaginatus. Flos speciosus illi *Teli Pogonis latifolii* paulo minor. Sepalum summum triangulum acutum per lineam mediam carinatum. Sepala lateralia latiora

subfalcata, dorsi nervo medio aequae carinata. Tepala lanceolato falcata, acuta, marginata. Labellum cordatum, cordiforme, acuminatum, papillis densis barbdatum. Gynostemium dense barbdatum. — Sepala flaveola, tepala (sicca) violaceo irrorata. Labellum et gynostemium atroviolacea. — Neugranada: Provinz Pamplona bei La Baja. 9000'. Januar. Nr. 1192. Schlim.

9. TELIPOGON HAUSMANNIANUS Rehb. fl. in Bonpl. IX. p. 213: *T. latifolius* H. B. Kth. Lindl. in Orchid. Lind. p. 231. N. 122: both terrestre and epiphyte. Flowers large, golden yellow, petals faintly streaked with purple. Violet hairs in the centre. The vast forests of Quindiu, province of Cauca 9840'. Los Volcanitos: Febr. 1843. N. 1285. Linden.

10. TELIPOGON ANGUSTIFOLIUS H. B. Kth. N. Gen. et Sp. I. 336. Lindl. Orch. Lind. 1846. p. 21. 23. N. 121:

Terrestre, at the entrance of the great Parano of Mucuchies, near the indian village of Chachopo. Leaves fleshy, imbricated, abbreviate. Flowers pale yellow. Petals transparent, rayed with purple, pollenmasses surrounded with violet hairs. Venezuela 10500'. N. 621.

11. TELIPOGON ASTROGLOSSUS Rehb. fl. Xen. I. Tab. 7. II. 12—19. p. 16:

Nulli affinis, tepalis ligulatis minute denticulatis, labello triangulo, acuto ante basin utrinque ligulato, dense papilloso velutino, fasciculis papillarum majorum 3 in disco, gynostemio utrinque fasciculo papillarum longarum extrorse barbato.

Plantula tenuissima, 2—4 pollicaris. Radices velatae obtuse flexuosae, tenues. Caulis internodia abbreviata. Vaginae membranaceae breves. Laminae lineari ligulatae acutae, basi paulo angustatae, margine tenuissime ac plane microscopice (apice praesertim) ciliolatae. Pedunculus terminalis filiformis, medio univaginat, apice spicatus. Bracteae ovato triangulae ovario pedicellato filiformi quater breviores. Perigonium hyalinum minutissimum. Sepala ovata acuta. Tepala ligulata retusa, microscopice serrulata. Labellum a basi breviter cuneata trilobum, lobi laterales postici retrorsi ligulati, lobus medius a basi latiori oblongus, apice apiculatus tota superficie papulis valde velutina, excepto plano basilari medio (pro recipiendo gynostemio) et apiculo; fasciculi papillarum longarum acuminatarum terni, alter major ante apicem, minores extrorsi posteriores utroque latere. Gynostemium a basi constricta dilatatum. Androclinium immersum rostello mediano anguste triangulo ascendente. Eovea immersa stigmatate quasi bilabiato, labium inferius rotundatum medio obtuse apiculatum limbo parce velutino. Fasciculus papillarum longarum in utroque latere extrorsus. Anthera cordiformis tenuissima. Pollinia quaterna oblongo compressa, externa minora; sessilia in caudiculae linearis basi dilatata rotundata. Glandula uncinata generis. Peru. Chachapoyas. Mathews.

1472. **VANDA** RBr.

In Bot. Reg. t. 506. L. O. p. 215. Bl. Rumphia IV. 48. — L. F. Aprili 1853:

Sepala explanata, omnia basi aequalia et angustata; saepius petaloidea. Petala sepalis conformia, saepius basi torta. Labellum basi saccatum vel calcaratum, cum basi columnae apodae continuum, carnosum, saepius sepalis multo brevius; subtrilobum aut integrum, ante calcar saepius callosum, auriculis nanis vel obsoletis. Columna crassa, nana, libera, apoda; clinandrio verticali. Stigma transversum; rostello obtuso vel retuso. Pollinia cereacea, plano-convexa, geminata, vel 2 alte bipartita; caudicula lorata aut cuneata, polliniis longior; glandula magna subrotunda vel triangulari. Anthera ovata, bilocularis, valvulis semilibris.

Herbae epiphytae Asiae tropicae. Folia coriacea, disticha, apice obliqua. Flores saepius racemosi, conspicui. Pedunculi laterales.

The limits of this genus are very difficult to ascertain; they are here defined by a saccate or calcarate lip continuous with the column, a truncate rostellum, and two or four pollen-masses attached to a broad caudicle having a large circular gland. It is very near *Luisia*, which is better known by its habit than by any very satisfactory peculiarity of structure, except having a very short broad caudicle, and thin gland. Probably *V. Lowei* at least will hereafter be separated, if other species agreeing with in its long drooping racemes and simple unguiculate lip should be discovered. The genus, as it now stands, may be divided into the following sections.

- §. 1. *Fieldia*. Lip obscurely auriculate, incurved, entire, concave at the base, with a strong tooth at or above its middle, Pollen-masses four.
- §. 2. *Euvanda*. Lip auriculate, straight, variously lobed, spurred, even or furrowed (usually with a tooth or callus in front of the spur).
- §. 3. *Lamellaria*. Lip auriculate, straight, variously lobed or entire, spurred, bearing from one to three perpendicular plates.
- §. 4. *Anota*. Lip without auricles, contracted and lobed at the point, spurred, with a pair of hairy elevated veins.
- §. 5. *Cristatae*. Lip auriculate, straight or recurved, quite naked, saccate or excavated at the base.

Obs. §. 1. *Fieldiam* pro genere enumeramus infra Rchb. fl.

§. 2. *Euvanda* Lindl. Fol.

1. *VANDA TESSELLOIDES* Rchb. fl. *V. Roxburghii* R. Brown in Bot. Reg. t. 506. L. O. 215. Bot. Mag. t. 2245. Van Houtte Fl. des Serres, Febr. 1846. Paxton's Flower Garden, t. 42. fig. 2. L. F. sub 4. (*V. Roxburghii*):

V. caule brevi crasso, foliis apice oblique tridentatis, racemis erectis foliis longioribus, sepalis petalisque oblongo-obovatis undulatis tessellatis obtusis, labelli lobo medio convexo ovato emarginato obtusissimo canaliculato ante calcar obtuse calloso auriculis acuminatis columnae subaequalibus.

Vanda Jones in As. Researches IV. 302.

Cymbidium tesselloides Rox. fl. ind. III. 463.

Wild on trees in many parts of Bengal, especially on the Mango—Roxb.

This fine species, the type of the genus, is readily known by its tessellated flowers and blue lip, the lateral lobes of which are sharp-pointed, and as long as the column.

2. *VANDA CONCOLOR* Blume Rumphia IV. p. 49. L. F. sub 5:

V. caule alto, foliis laxis membranaceis apice oblique tridentatis, racemis elongatis plurifloris, floribus distantibus, sepalis petalisque oblongo-obovatis unguiculatis undulatis unicoloribus obtusis, labelli lobo intermedio cuneato bilobo basi puberulo lineis elevatis, auriculis obtusis, calcare conico attenuato intus pubescente.

V. furva Bot. Reg. 1844. Misc. 42.

V. Roxburghii unicolor Hooker in Bot. Mag. t. 3416.

Wild in China—Loddiges.

According to Blume this is not the *Angraecum furvum* of Rumphius, but a distinct species. It has the habit of *V. Roxburghii*, but differs not only in whole colour of its sepals and petals, and the other characters above indicated, but also in being

a large lax-growing plant, five or six feet high, with much thinner and longer leaves. From the real *Vanda furva* it differs in the colour and form of the lip, in the attenuated spur, in the absence of a callus at the entrance of the latter, and in the total absence of the tessellation found in *V. furva*, as well as in *V. Roxburghii*.

3. VANDA FURVA Lindl. Orch. p. 215. Blume Rumphia IV. 48. t. 192. fig. 1 and t. 197. L. F. sub 6:

V. foliis canaliculatis rigidis apice oblique retusis, racemis erectis folio brevioribus laxis 3—5-floris, sepalis oblongo-obovatis, petalis unguiculatis obovatis falcatis aequalatis, labello patulo panduriformi glabro(?) apice rotundato emarginato plano lineis 5 elevatis, dente valido ante calcar obconicum obtusum auriculis obtusis ascendentibus.

Angraecum furvum Rumph. Herb. Amb., VI. t. 46. fig. 1.

Wild in the Moluccas and in Bima—Blume.

The figure in Blume's Rumphia, copied from an original in Professor Reinwardt's collection named *Aerides bicolor*, together with the details added by the former author seem to indicate that this is really a species distinct both from *V. fuscoviridis* and *concolor*, both which I have formerly supposed might be identified with it. The flowers are the size of *V. Roxburghii*, and grow in a few-flowered raceme much shorter than the leaves. The sepals and petals are of the same size, of a rich cinnamon colour distinctly tessellated; the petals are the same size as the sepals, but unguiculate and strongly falcate. The lip is rose coloured, apparently smooth, nearly oblong, with a shallow contraction below the round two-lobed point; at its base stands a stout tooth; its lateral lobes seem very short and blunt; the spur seems to be conical without attenuation. According to Blume it is called *Angrek Kitsjil glap* by the Malays.

4. VANDA INSIGNIS Blume Rumphia IV. p. 49, t. 192, fig. 2, and t. 197, b. Paxton's Flower Garden, t. 42, with a woodcut.

V. foliis rigidis canaliculatis apice inaequali abscissis vel dentatis, racemis erectis folia adaequantibus laxis 5—7-floris, phyllis perigonii obovato-oblongis rectiusculis, labelli lobis lateralibus ascendentibus obtusis intermedio arrecto apice dilatato rotundato undulato ad basin sub-hastatam e tuberculo obtuso cum lineis 2 elevatis, calcare obconico obtuso.—Blume.

Wild on the mountains of Timor—Blume.

According to Blume's figure this would seem to be a very handsome species. The flowers are two and a half inches in diameter; green outside, brownish inside. The lip is pink, white at the base, with a singular gauffered surface if we are to trust his figure 192, but flat as in other Vandas judging from his figure 197. The name is frequent in collections, but I have never seen the plant alive, unless it was a specimen flowered by Mr. Knowles of Manchester, in which the lip was furnished with larger side lobes than in Blume's figure 197, but otherwise identical, especially in the concave not convex state of the lip, and the two elevated lines which run along its middle. The sepals and petals were dull yellow-blotched with brown. The lip was white, with a faint shade of violet in the middle, and rich deep crimson streaks at the base. The flowers had a slight and agreeable fragrance, even when cut and kept in a sitting-room. See Paxton's Flower Garden, Nr. 311.

5. VANDA HINDSH Lindl. in Hook. Journ. Bot. 1844. II. 237. L. F. Nr. 8:

V. foliis arcuatis canaliculatis (pedalibus) apice oblique emarginatis et excisis, racemo horizontali laxo 10-floro foliorum longitudine, pedicellis floribus 3-plo longioribus, sepalis petalisque obovatis unguiculatis lobato-crispis, labelli cornu brevi obtuso lobo intermedio convexo cu-

neato apice rotundato bilineato ecalloso, lateralibus abbreviatis rotundatis hinc acutis explanatis, auriculis nanis.

Wild in the forests of Gew-Guinea—Hinds.

This has the habit of *Vanda suavis*, and its flowers seem to be of the same texture and size. Their colour cannot be judged of from the single dried specimen. The short blunt spur is downy inside; there is no callus at the base of the lip; the pollen and anther are those of *V. Roxburghii*, but the gland is much larger and rounder.

6. VANDA TRICOLOR Rehb. fil. in Otto Hamb. Gtz. 1860. p. 281.

a. *suavis* Rehb. fil. l. c. Huc: *Vanda suavis* L. F. sub 9:

V. foliis loratis flaccide recurvis apice oblique dentatis, racemis laxis elongatis, sepalis petalisque spathulatis retrorsis convexis valde undulatis sublobatis apice rotundatis, labello convexo trilobo lacinia media angusta alte bifida 3-costata lateralibus longis ovatis acutis patulis, auriculis erectis rotundatis.

(A). Flowers white, with blood-red scattered spots. Paxton's Flower Garden t. 42. fig. 3.

(B) *flava*. Flowers yellow, with broad oblong rich brown spots.

V. tricolor Hooker Bot. Mag. t. 4432.

Wild in Java.

This has the foliage of *V. Roxburghii*. Flowers large, deliciously fragrant, white or yellow, with rich marbling and spotting. Lip deep violet. The lobed sepals and petals are remarkable; they are both bent back at an angle of about 120°, and the petals are twisted round so as to present the principal part of their back to the eye. It is very rare in gardens, the plants thus called being almost always varieties of *V. tricolor*. The figure in the Botanical Magazine is characteristic, but I have never seen the flowers so yellow or the brown spots so large as they are there represented.

Pescat. 8. Rehb. fil. Xen. tab. 12. Rehb. fil. Bonpl. III. 219. Die äche Pflanze mit milchweissen Blüthengrunde blühte neulich sehr reich bei Herrn Consul Schiller, eine andere Form mit gelbweissen Grundtönen der Blüthe steht jetzt bei Herrn Senator Jenisch in voller Entwicklung. Wir möchten nunmehr bald fragen, ob diese letztere nicht eine Mittelform zwischen *Vanda tricolor* und *suavis* sein könnte.

b. *tricolor* Rehb. fil. l. c. Huc: *Vanda tricolor* Lindl. B. Reg. 1847. sub t. 59. Paxt. Fl. G. t. 42 et l. c. sub 10:

V. foliis canaliculatis racemo paucifloro longioribus, sepalis petalisque aequalibus coriaceis unguiculatis obovatis obtusis, labello aequilongo trilobo per axin 3-lineato basi vix calloso, laciniiis lateralibus rotundatis intermedio convexo cuneato emarginato latioribus, auriculis erectis rotundatis, calcare brevi obtuso.

V. suaveolens Blume Rumphia IV. p. 49. (1848).

(A) Sepals and petals cinnamon, blotched with brown; lip rose-colour.

(B) *flava*. Flowers wholly yellow, except a faint violet stain in the middle of the lip.

Wild in Java; on trees, especially *Saguerus saccharifer*, in woods on the mountains on the west side of the island—Blume.

This fine plant always has the sepals white at the back, whatever may be the colour of the inside. Some other varieties occur in collections, of which the three following are the most notable: — 1. *V. t. pallens*. Flowers cream-coloured, with scattered brown spots. 2. *V. t. cinnamomea*. Flowers yellower, with lines of close cinnamon-coloured spots. 3. *V. t. planilabris*. With a clear citron ground-colour, scattered broad brown spots, and a flat purple lip. This looks very distinct from the others.

Pescat. t. 44. Lem. Jard. Fl. II. t. 136. Blume in Ann. d'hort. Fl. Jard. pays bas II. 1.

7. VANDA BICOLOR Griffith notul. p. 351. ic. t. 330. L. F. sub 11:

V. foliis loratis coriaceis medio semitortis apice valde obliquis subtridentatis, racemis erectis rigidis paucifloris brevioribus, pedunculis angulatis, sepalis petalisque obovatis repandis falcatis tessellatis anticis duplo majoribus, labello linguæformi emarginato basi minute bicalloso auriculis latoribus columnæ margini connatis, calcare brevi conico obtuso.

Wild in Bootan, on trees on the banks of the Monass River, at the elevation of 2300 feet—Griffith.

Flowers less than two inch across, whit externally, yellowish brown inside, with obscure livid tessellations. Ovary very long, white. Lip lilac, with large white auricles, giving the base a broad cordate appearance, dotted with lilac and tinged with yellow. Capsule very large, club-shaped, six-winged, almost a span long. The length of the anterior sepals brings the species into the neighbourhood of *V. lamellata*.

8. VANDA FUSCOVIRIDIS Lindl. in Gard. Chron. 1848. p. 351, with a cut repeated in Paxtons Fl. Gard. under tab. 42 p. 20. no. 4. L. F. sub 12:

V. . . . ; racemo paucifloro brevi, sepalis oblongis planis obtusis, petalis unguiculatis obtusis falcatis subundulatis latoribus, labello basi tomentoso ecalloso 5-sulcato bilobo medio utrinque exciso auriculis erectis obtusis nanis, calcare cylindræco labelli dmidii longitudine.

Wild in (Java?).

The flowers are about as large as *V. furva*, dull brown, with a little greenish yellow at the edge, and a pure greenish yellow lip; they have a slightly fishy smell. The species seems to be distinct from all the others; *V. furva*, to which it approaches nearest, has no undulation of the sepals, nor it would seem any tomentum on the lip, which bears, at its base, a great tooth which is missing, I believe, in this species.

9. VANDA LIMBATA Blume Rumphia IV. p. 49. L. F. sub 13:

V. „labelli lobo medio arrecto panduriformi margine inferne revoluta apice rotundato-spathulato integerrimo.“

Wild in Java—Blume.

According to Blume the roots of this are very long. The leaves somewhat curved seven to eleven inches long, nearly an inch broad, obliquely retuse, channelled, and coriaceous. Racemes erect, lax. The flowers much spreading, about one and a half inch in diameter, ochre-yellow outside, clouded with brown inside; the two inner more narrowed at the base than the others. The lip much spreading, lilac, expanded at the base of the somewhat panduriform middle lobe, with five slightly elevated lines; spur compressed, obconical, with a flat transverse rounded callus.

10. VANDA HELVOLA Blume Rumphia IV. 49. L. F. sub 14:

V. „foliis rigidis subundulatis basi carinatis apice oblique retusis, racemis erectiusculis folio brevioribus laxè subtrifloris, phyllis perigonii oblongo-spathulatis lateralibus 2 exterioribus sub labello conniventibus, labelli saccati lobis lateralibus conniventibus obtusis intermedio patulo triangulari.“ — Blume.

Wild in mountain woods on the West of Java, flowering in March and April—Blume.

Blume states this to be a most magnificent species, forming a sort of transition between *Vanda*, *Renanthera*, and *Cleisostoma*. Flowers the size of *V. suaveolens* (my *tricolor*), wine-red, shading into pale purple, with the lateral lobes of the lip short and a brighter purple. Column much dilated at the base; the little sac of the lip has a pair of small callosities on the side opposite the column; the middle lobe is triangular-hastate, tumid inside, and a little furrowed, concave beneath.

Gardeners Chronicle 1855, 316: sent by Pass, gardener at the Fence near Macclesfield. Shorter in leaves, dwarfer in habit than *V. tricolor*. We have not seen more

than a couple of flowers, which by no means justifie the reputation, which the species has hitherto enjoyed. Dr. Blume calls it a magnificent species with wine red flowers shading into pale purple and a brighter purple lip. What we have seen were of a dirty straw colour, tinged with a brownish violet over the upper half of sepals and petals, while the triangular lip, although less yellow, was seen little brighter or deeper in colour, than the other parts.

11. VANDA STANGEANA Rehb. fil. in v. Schl. Bot. Ztg. 1858. p. 351.

Obs. *Vanda Sulingi* Bl. Lindl. Fol. Nr. 15. cf. *Renantheram*, p. 875.

12. VANDA TERES Lindl. in Wall. Cat., no. 7324. Bot. Reg. t. 1809. Bot. Mag. t. 4114. Griffith notul. 252. L. F. sub Nr. 16:

V. scandens, foliis teretibus, racemis ascendentibus subbifloris foliis aequalibus, sepalis oblongis obtusis; supremo erecto lateralibus semitortis labello suppositis, petalis majoribus suborbiculatis undulatis, labello maximo cucullato pubescente apice dilatato rotundato emarginato auriculis subrotundis maximis incurvis, calcare magno infundibulari.

Wild in hot damp jungles in Sylhet, Burmah, Martaban, scrambling up the bark of trees — Griffith.

Flowers very large; sepals white; petals sanguine, with a white border. Lip sanguine, strongly veined, yellow on the upper surface below the point, and speckled with crimson. A most beautiful species. Griffith says that the sepals and petals adhere at the base, and he questions its being a *Vanda* at all. No doubt in the triangular gland and cuneate caudicle it differs from other species. — Rev. Hort. Paris 1856. p. 421. t. 22.

13. VANDA HOOKERIANA Rehb. fil. in Bonpl. 1856. p. 324.

§. 3. Lamellaria.

14. VANDA HOERULEA Griffith Mss. Lindl. in Bot. Reg. 1847., sub t. 30. Nr. 1284. Griffith, itin. not. p. 88. Paxtons Fl. Gard. t. 36. L. F. sub 18:

V. foliis coriaceis apice aequalibus truncatis sinu concavo lobis lateralibus acutis, spicis densis erectis multifloris, bracteis oblongis concavis obtusissimis membranaceis, sepalis petalisque basi tortis azureis membranaceis oblongis obtusissimis planis subunguiculatis, labello coriaceo lineari-oblongo apice divergenti-bilobo obtuso per axin trilamellato auriculis triangularibus acuminatis, calcare curvo obtuso intus laevi.

Wild in Khasia, at the height of 3—4000 feet — J. D. Hooker and T. Thomson near the R. Borpane at an elevation of 2500 feet, on trees of *Gordonia*, in Pine and Oak forests—Griffith.

Leaves five inches long by nearly one wide; equally two-lobed, and sharp-pointed, so that the end looks as if a piece had been struck off by a circular punch. The bright blue flowers grow in upright spikes. Each flower is nearly four inches in diameter. The lip is barely three quarters of an inch long, narrow with a short spur and a two-lobed point. Its surface is broken by three deep parallel perpendicular plates, and the auricles of the base are triangular and acuminated.

Rehb. Xen. I. tab. 5. — Lindl. Journal II. S. 1851. VII. VIII. Lem. Gard. Fl. I. 102. Pescat. 32.

15. VANDA COERULESCENS Griffith Notulæ p. 352; Ic. t. 331. L. F. sub 19:

V. caule elongato, foliis angustis loratis bilobis, pedunculis nudis distanter vaginatis erectis multifloris foliis et caule multo longioribus,

pedunculis trigonis, sepalis petalisque basi tortis unguiculatis ovatis obtusis, labello ovato auriculato columnae adnato, calcare recto conico.

Wild in Burma, on trees at Tsenbo near Bamo—Griffith.

Only known from some notes of Griffith, and a rude figure. The species appears to be near *V. spatulata*. Sepals and petals pale blue; lip white at the base, blue at the point, with the auricles purplish lilac inside. Column blue, minutely dotted.

16. VANDA LAMELLATA Lindl. in Bot. Reg. Misc. 1838. Nr. 125. L. F. sub 20:

V. foliis coriaceis oblique et acute bidentatis, spica multiflora thyrsoides, sepalis petalisque obovatis obtusis undulatis inferioribus subincurvis majoribus, labello lineis 2 divergentibus elevatis acuto obtusato retuso pone apicem bituberculato, auriculis nanis rotundatis, calcare brevi cylindraco conico intus hirsuto.

Wild in the Philippines—Cuming.

Flowers in long loose erect racemes, pale yellow, streaked with dull pale red.

17. VANDA SPATHULATA Spreng. Syst. 3. 719. L. O. 216. L. F. sub 21:

V. caule elongato, foliis ovato-oblongis obtusis oblique emarginatis, pedunculis nudis distanter vaginatis erectis multifloris foliis et caule multo longioribus, sepalis petalisque oblongis obtusis planis, labello rhomboideo apice incurvo medio cristato basi infra calcar acute conicum bicalloso auriculis retusis, ovario hexaptero.

Wild in Mysore and Malabar.

A species with long corymbose racemes of golden-yellow flowers standing high above the short distichous leaves. Both leaves and flower-stalks are marked with crimson spots; the former vary in breadth and length. Inside the spur of the lip is a pair of linear diverging calli free at the upper end. — Wight Ic. III. 915.

§. 4. Anota.

18. VANDA DENSIFLORA Lindl. in Paxt. Fl. Garden, under t. 42. L. F. sub 22:

V. foliis latis loratis coriaceis apice uncinato-bilobis obliquis, racemis strictis cylindracois multifloris, sepalis oblongis obtusis, petalis angustioribus obovatis, labello edentulo inappendiculato lineis 2 elevatis juxta calcar pubescentibus oblongo carnosio infra apicem constricto exinde tripartito sub apice mucronato lobis rotundatis intermedio inflexo minore, calcare vacuo conico brevioris.

Saccolabium giganteum L. O. 221.

Wild in jungles in Burma; near Prome—Wallich.

Although the pollen apparatus of this is not known to me, yet its habit, so much like that of *V. gigantea*, and its thick leathery lip, lead to the placing it in *Vanda*. The leaves in the specimen before me are nearly a foot long and one and three-quarters of an inch broad. The racemes are erect, very dense, with broad short membranous reflexed bracts when the flowers have fallen. The latter are much less fleshy than in *V. gigantea* etc. Two elevated hairy lines pass from within the spur diverging in the middle and reuniting at the contracted portion of the lip.

§. 5. Cristatae.

19. VANDA CRISTATA L. O. 216. Sertum Orchidaceum, fig. 3. in front. B. R. t. 48. 1842. L. F. sub 23:

V. foliis canaliculatis recurvis apice truncatis oblique excisis tridentatis, racemo erecto trifloro, foliis brevioris, sepalis oblongis obtusis

fornicatis, petalis angustioribus incurvis, labello oblongo convexo sulcato apice saccato inaequaliter tricorni, auriculis ovatis, calcare conico vacuo.

(B.) Flowers much paler. Lip without the apical horns.

Wild in Nepal—Wallich; Bootan—Griffith; B. Sikkim—Catheart.

Flowers green; lip regularly striped with rich purple on a buff ground, and divided at the end into two or three narrow acute diverging unequal lobes. This is the plant mentioned in Griffith's Itinerary Notes p. 203. Nr. 1188, as an *Aerides* growing on trees at Chuka, remarkable for smelling of Cockroaches.

The var. B. is only known to me by one of Mr. Catheart's drawings. It brings *V. cristata* still nearer to *V. alpina*.

20. *VANDA GRIFFITHII* Lindl. in Paxt. Flow. Gard. under t. 42. L. F. sub 24:

V. foliis canaliculatis recurvis acute inaequaliter tridentatis, racemis erectis 5-floris foliis brevioribus, sepalis linear-oblongis recurvantibus, petalis acuminatis, labello ovato elongato sulcato mucico basi concavo vacuo.

Wild in Bootan—Griffith.

Very like *cristata*; but perfectly distinct in the termination of the leaves, which are sharply and unequally three-lobed, not truncate and praemorse; and in the form of the lip. The flowers are much smaller. A wrong reference in my herbarium led me to refer this to 546 of Griffith's Bootan plants, which the publication of his *Icones* shows to belong to *V. bicolor*.

21. *VANDA ALPINA* Lindl. Fol. sub 25:

V. foliis canaliculatis recurvis oblique (nunc acute) bilobis mucronulo saepius interjecto, racemis subsessilibus erectis 2—3-floris, sepalis oblongis sub apice incrassatis, petalis paulo minoribus, labello oblongo concavo nudo sub apice gibboso emarginato, auriculis cum lamina confluentibus.

Luisia alpina Lindl. in B. R. 1838, Misc. 101.

Wild in Khasia, at the height of 5—6000 feet—J. D. Hooker and T. Thomson; near Nungklow—Gibson.

The habit is that of *V. cristata*; the flowers approach so nearly to those of *Luisia*, that it is a question to which genus it belongs; the pollen apparatus is more that of *Vanda*. Flowers small, pale green. Lip yellowish, streaked with dull purple. Basal hollow deep purple.

1472. *FIELDIA* Gaudich.

Voy. 421. t. 36.

1. *FIELDIA LISSOCHILOIDES* Gaudich. l. c. Huc: *Vanda Batemanni* Lindl. Bot. Reg. 1846, t. 59. L. F.: *Vanda* 1:

V. foliis planis coriaceis oblique emarginatis obtusis racemo laterali multifloro brevioribus, bracteis coriaceis, alabastris globosis, sepalis petalisque falcatis obovato-cuneiformibus obtusis, labello triangulari basi saccato lobis ascendentibus acutis apice carnosio sulcato uncinato dente elevato in medio et crista brevi transversa juxta basin.

Angraecum quintum Rumph. Herb. Amb. VI. 102.

V. lissochiloides L. O. 216. Blume Rumphia IV. 49.

Fieldia lissochiloides Gaudich Voy. 421. t. 36.

A very large erect plant, with remarkably thick aerial roots, sword-shaped curved hard leaves averaging two feet in length, and a still longer spike of some score of flowers, each full two inches and a half across, flat, leathery, and long enduring; rich golden yellow, spotted all over with crimson in front; behind a vivid purple, fading away at the edges into violet. A rare species of extraordinary beauty, according to Blume the Angrek Kringsing Kitsjil of the Malays.

2. *FIELDIA GIGANTEA* Rehb. fil. Xen. II. p. 38. huc *Vanda gigantea* Lindl. in Wall. Cat., Nr. 7323. L. O. 215. L. F.: *Vanda* 2:

V. foliis late loratis apice obtusissimis emarginatis subaequalibus, racemis foliis duplo brevioribus, sepalis petalisque oblongo-obovatis obtusis aequalibus, labello incurvo canaliculato dolabriformi obtuso: callo conico in medio, auriculis nanis rotundatis.

V. Lindleyana Griff. notul. 353.

Wild in Moulmein, and other parts of Burma; on *Lagerströmia Reginae*, on the banks of Tenasserim river, near Barlavo — Griffith.

Leaves tough and fleshy, fifteen inches long by two and half broad. Flowers of the size of *V. Roxburghii*, resupinate, deep yellow with cinnamon brown blotches. Pollen-masses four, with a narrow caudicle and broad square membranous gland. Griffith says it is the only Orchid he had seen capable of rivalling American *Vandae*: which is surely a great exaggeration.

1472/2. **ESMERALDA** Rehb. fil.

Xen. II.

1. *ESMERALDA CATHCARTI* Rehb. l. c. Huc: *Vanda Cathcarti* L. F.: *Vanda* p. 8. Nr. 17:

V. longe caulescens, foliis oblongis planis subundulatis apice rotundatis oblique bilobis, racemo laxo erecto paucifloro brevioribus, sepalis petalisque oblongis rotundatis sessilibus aequalibus, labello coriaceo basi mucico cuniculato auriculis nanis rotundatis lobo intermedio cordato obtuso margine elevato tomentoso rugoso, per axin bicostato ante cuniculum carnosissimo.

Wild in Sikkim Himalaya, at 3000 feet—J. D. Hooker; hot places 2—4000 feet—Cathcart.

This seems to be a very showy scrambling plant, with the habit of *Renanthera coccinea*. The leaves are six to seven inches long, by one hand a half broad, or somewhat less. The flowers are fleshy and from three to four inches in diameter, in a two, to four-flowered straggling raceme; the sepals and petals are white outside, yellowish with horizontal narrow cinnamon-brown bands. The lip, which resembles a tray, is white, with a downy yellow turned-up edge; its auricles are speckled with red, as is the calus formed by the junction of two strong ribs that run along the middle dividing it into two halves; at the base, instead of a spur, there is a deep horizontal hole, worked in the thickness of the lip, and reaching to about one-third of its length. The column is green, tinged with red; the anther is bright yellow. The pollenmasses, which I have not seen, appear to be four.

No more remarkable Orchid has been found in Northern India, and therefore it is selected to bear the name of J. F. Cathcart, Esq., who caused a noble collection of drawings to be made in Sikkim, some account of which it is to be hoped that the public will have in time from Dr. Hooker.

Hook. It. Himal. Pl. t. 23.

1472 $\frac{1}{3}$. **ACAMPE** Lindl.

Fol. I. April 1853. Fasc. IV.

Sepala carnosa, fragilia, explanata, omnia basi aequalia, lateralibus calcari labelli leviter adnatis, dorsali paulo majore vel remotiore. Petala sepalis conformia, semper recta. Labellum carnosum, fragile, saccatum, vel calcaratum, columnae apodae adnatum, indivisum, auriculatum; saepius infra saccum linea elevata seu lamella pilisque auctum. Columna crassa, nana, apoda, angulis anticis saepius in mucronem productis; clinandrio verticali. Stigma transversum, subrotundum, rostello brevi obscuro, emarginato. Pollinia cereacea, geminata; caudicula subulata pollinibus longiore; glandula parva subrotunda. Anthera ovata, bilocularis, valvulis semiliberis. — Herbae epiphytae Asiae tropicae. Folia coriacea, disticha, apice obliqua. Flores dense racemosi carnosus, fragiles, lutei, maculati. Pedunculi breves, rigidi, laterales, bracteis latis brevibus diu persistentibus.

Although these plants have been hitherto placed in the genus *Vanda*, yet their small brittle flowers, in which there is no flexibility, their lip adnate to the edges of the column, the slender caudicle, and very small gland afford convenient means of separating them from the true *Vandas*, to which they bear little resemblance. As now limited, *Acampe* forms a very natural groupe.

1. **ACAMPE MULTIFLORA** L. F. 1.:

A. foliis loratis apice obliquis emarginatis, pedunculis ramosis erectis subcorymbosis foliis brevioribus, labello ovato acutiusculo, calcare vacuo.

Vanda multiflora Lindl. Collect. Bot. t. 38.

Wild in China — Reeves; common in the ravines of Hoffg Kong, flowering in September, or earlier — Champion.

A species of no beauty, with coarse fleshy leaves and small yellow flowers dotted with sanguine. I seem to have formerly confounded with it specimens of *A. longifolia*, which differs among other things in having a hairy raised line inside the sac of the lip.

2. **ACAMPE LONGIFOLIA** L. F. 2.:

A. foliis longis loratis apice obliquis obtusissimis, racemis horizontalibus foliis triplo brevioribus, labello carnosus plano subrotundo-ovato transverse rugoso basi concavo pubescente crista carnosus per axin.

Vanda longifolia L. O. 215. Journ. Hort. Soc. VII.

Wild in Tavoy—Wallich.

A fine-looking plant, with dark green distichous leathery waxy leaves as much as a foot and a half long two inches wide, obliquely rounded at the end. Flowers insignificant, sweet-scented, much like those of *Acampe multiflora* in form and colour, except that they are paler, in a corymb at the end of a short stiff ascending peduncle not one quarter the length of the leaves; very fleshy, and banded with red upon a dull yellow ground; the lip is white. Inside the pouch of the lip are numerous yellowish hairs, concealing an erect fleshy plate, which slightly divides the hollow of the lip into two halves.

3. ACAMPE WIGHTIANA L. F. Nr. 3.:

A. foliis oblique bilobis, racemis densis sessilibus nanis, sepalis petalisque obtusissimis, labello ovato obtuso fimbriato basi bicorni, calcare intus piloso.

Vanda Wightiana? Wight ic. t. 1670.

V. fasciata Gardner MSS.

Wild on trees in India; Iyamally Hills and Malabar—Wight; Ceylon—Gardner.

„Flowers yellowish, dashed with dark crimson or purplish spots; lip nearly white, with a red line at the base of the lamina.“ — Wight. Two subulate horns are represented in Wight's plate as springing from the base of the lip; they probably represent the tubercles found in *A. congesta*. My specimens are decayed and unexamenable as to this point.

Hue: *Vanda Wightiana* Lindl. Mss. Herb. Wight Ic. V. 1670.:

Leaves strapshaped unequally twolobed at the apex; peduncles much shorter than the leaves, divaricate, sep. pet. subspathulate, sep. all equal, larger than the petals, lip threelobed, lat. lob. short obtuse; middle one suborbicular, saccate at the base, fruit oblong, conical. Flowers yellowish, dashed with dark crimson or purplish spots, lip nearly white with a red line at the base of the lamina. Jyamally Hills.

My spec. seen by Lindl. is in fruit. Had he seen flowers, he would have referred it to a diff. genus. Aff. *Saccolab. papilloso?*

4. ACAMPE CONGESTA L. F. sub Nr. 4:

A. foliis elongatis canaliculatis oblique bilobis mucrone interjecto, racemis subsessilibus nanis, labello rhombeo acutangulo papilloso linea media elevata, calcare intus piloso, linea elevata sursum mucronata.

Vanda congesta Lindl. in Bot. Reg. 1839, Misc. 94.

Wild in Madras Presidency—Wight $\frac{1836}{1019}$; Ceylon—Loddiges.

Flowers small, yellow and brown. From *A. papillosa*, to which I have formerly referred it, owing to some mixture of specimens, it differs in having very long leaves, and an acute-angled lip, with a distinctly elevated middle line. At the junction of the spur and lamina there is a stout tubercle on each side.

5. ACAMPE PAPILLOSA Lindl. Fol. Nr. 5:

A. caule elongato ramoso, foliis obtusis oblique emarginalis mucrone interjecto, racemis sessilibus nanis, labello ovato oblongo papilloso medio elevato calcare intus piloso auriculis antice confluentibus.

Saccolabium papillosum L. O. 222. Bot. Reg. t. 1552, with its synonyms.

Wild on the continent of India; Prome—Wallich; Malabar; East Bengal and Chittagong—J. D. Hooker and T. Thomson; hot valleys of Sikkim—J. D. Hooker.

Flowers small. Petals and sepals yellow banded with red. Lip white. It differs from *A. congesta* in the form of the lip, and the nature of the papillosity, which is always crowded into an elevated line in the middle. The Sikkim plant collected by Dr. Hooker, and referred here, is not in flower. The lip varies in its length and in the degree of crispness; but is very badly represented in the Botanical Register.

6. ACAMPE CEPHALOTES Lindl. Fol. Nr. 6:

A. racemis capitatis pedunculo rigido squamato brevioribus, labello ovato subcordato papilloso crispato calcare brevi conico intus villosa, auriculis carnosiss confluentibus.

Wild in Sylhet; on the plains — J. D. Hooker and T. Thomson.

„Flowers yellowish green with transverse bars of brown purple. Lip posterior, very pale rose, with deeper spots, much fimbriated on the disk.“ — J. D. H. and T.

T. This exists in Hooker and Thomson's Indian collection numbered 197; but the leaves associated with it appear to belong to *Vanda alpina*. The short conical blunt spur, very dense flowers, and fleshy shallow auricles distinguish it sufficiently from *A. papillosa*.

7. *ACAMPE EXCAVATA* Lindl. Fol. Nr. 7:

A. foliis rectis planis lobo altero truncato dentato altero longiore rotundato, racemis sessilibus nanis, sepalis petalisque angustis dorsali majore, labello ovato acuto excavato basi unidentato, calcare intus piloso.

Wild in Western India; the Concan—Law.

Habit, that of *A. papillosa*. Colour of flowers unknown.

8. *ACAMPE DENTATA* Lindl. Fol. Nr. 8:

A. caule flexuoso, foliis latis planis oblique rotundatis paniculae gracili angustae aequalibus, sepalis petalisque distantibus falcatis, labello brevi ovato in centro papilloso basi utrinque dentibus 2 carnosis aucto, auriculis obsolete, calcare recto cylindraco elongato pendulo intus villosa.

Wild in Sikkim Himalaya, on the lower ranges—J. D. Hooker.

The long slender panicle, and the four great fleshy teeth at the base of the lip are features peculiar to this species, whose flowers are about the size of *A. papillosa*; their colour is unknown to me.

1473. **RENANTHERA** Lour.

Labellum minutissimum cum gynostemio bene articulatam; lobi laterales erecti semiovati antice falculati, nunc margine superiori bidentato bilobuli in calcar saccato cylindraceo descendentes; lobus medius ligulatus parvus nunc acutiusculus, margine undulatus seu planus. Gynostemium semiteres, retusum, antrorsum utrinque superne rhombeo angulatum, toto margine antico velutinum; fovea elliptica transversa; androclinium velutino marginatum, bicameratum; rostellum retusum medio emarginatum; anthera depressa antrorsum ligulata retusa. Pollinia oblonga, extrorsum more generis fissa insidentia in apice lineari caudiculae ceterum triangulo ligulatae glandulae oblongae peltatim affixae. — Flores primum pulcherrime sanguinei, extus pallidiores, disco sepalorum lateralium aureo, uti tepalorum bases atropurpureo guttato. Labellum intus atropurpureum. Gynostemii dorsum atropurpureum; facies antica straminea lineis duabus longitudinalibus violaceis sub fovea. Sensim flores mutantur in colorem luteo cinnabarinum.

Salak. Blume.

B. Arrhynchium: labelli lobi laterales prope oblitterati; lamina media calloso carnososa supra ostium calcaris oblique adnati protensa. (Pollinia bina bipartita seu quaterna caudicula triangula seu lineari subulata; glandula quadrata seu triangularis.)

6. RENANTHERA LABROSA Rehb. fl. l. c. p. 88:

Labelli ascendentis lamina ovali medio gibberosa, auriculis minutis triangularis, glandula triangulari.

Arrhynchium labrosum Lindl. Fl. Garden I. 142.

Habitu Sarcophilii Vandaeae parvulae. Folia disticha coriacea. Racemus. Flores aequidistantes, diametro uncia, coriacei, purpureobrunnei, flavo maculati. Sepala et tepala subaequalia, obtusa, tepala subbrevia, omnia basi aequalia. Labellum ungue cuneato ascendens, carnosum ante basin utrinque minute triangulo auriculatum; lamina lutea carnosissima rugosa ovalis, horizontaliter fissa, calcaris obtusi convexitati adnata, ore calcaris incrassato fere clauso. Columna nana, teres basi producta, stigmatibus circulari. Anthera subrotunda, bilocularis, membranacea, depressa. Pollinia quaterna, geminata aequalia, caudicula subulata, glandula triangulari membranacea semilibera. Rostellum truncatum. — „The lip is a hollow curved blunt horn, rising from the base of the column with its convexity upwards; on the convexity lies a flat yellow wrinkled fleshy tongue, which seems as if it consisted of two layers; at the base the lip is concave and has on either side a short truncate ear, with which it clings the column. Column is taper, short, straight, with a nearly circular slope. No known genus can receive this singular plant, unless it is thrown into the crowd of Saccolabs, among which however it would scarcely be sought; for its thick fleshy lip is very different from the thin membrane found in that genus. Moreover it is essentially distinguished by its rostell, not being extended into a long beak as is the case in all genuine Saccolabs and Sarcophils. As for Sarcophilus, which it is said to resemble, that genus is quite different in the long narrow foot on which the lip is placed, as well as in the nature of the lip itself. — Tropical Asia.”

Huc: *R. bilinguis* Rehb. fl. Xenia 4:

Labelli patuli lamina ligulata medio plana, auriculis magnis rectangulis, intus gibberosis, glandula quadrata. An haec planta eadem: „I am uncertain, whether a plant,

very rare in Gardens, bearing this name. („Vanda Sulingi“) and much resembling a Renanthera, is what Blume intends; but I presume not“ Lindl. Fol. IV. Vanda p. 7. sub V. Sulingi Bl.

C. Arachnanthe: labellum minute angulato calcaratum seu angulatum; lobus medius ancipiti carinatus. (Basis labelli lineis gyrosis percursa.)

A. Ovaria et sepala extus glabra; calcar manifestum.

6. RENANTHERA FLOS AERIS Rehb. fl. l. c. p. 89:

Sepalo dorsali lineari ligulato obtuse acuto recto, tepalis sepalisque lateralibus descendenti arcuatis subaequalibus nunc apice oblique retusis, labelli lobis lateralibus oblongo quadratis erectis lineis gyrosis inter utrumque lobum supra fundum calcaris retrorso conici minutis, lobo medio carnosio ancipiti superpositeque bidentato.

8. RENANTHERA LOWEI Rehb. fl. l. c. 89:

Sepalis tepalisque oblongo lanceolatis margine undulatis, labelli lobis lateralibus triangulis, lineis gyrosis interjectis inter utrumque supra angulum obtusum (calcar evanidum) in basi lobi medii, lobi medi carina inflexa ancipiti duplici, superioris ligulata retusa, ancipiti, inferiori acutangula minuta, ipso lobo bipartito, partitione superiori erecta triangula in aristam rectam exeunte, inferiori acuta triangula antrorsa.

Vanda Lowei Lindl. Gard. Chron. 1847. 239.

„Folia coriacea rigida disticha.“ Lindl. Pedunculus flaccidus, pendulus „usque duodecim pedes longus“ papillis muriculatis scaber distanti racemosus. Bractee semiovatae acutae ovaria hispida aequantes, extus minute scabrae, margine dense scabro velutinae. Perigonium illi Renantherae coccineae amplius et sepala ac tepala subaequalia latiora. Tepala et sepala intus punctulato velutina. „Flores citrini, cinnamomeo guttati et fasciati.“ — Gynostemii dorsum bene velutinum. — Crescit in arboribus exaltatis locis humidis insulae Borneo. Low!

Huc: *Vanda Lowei* Lindl. in Gard. Chron. 1847. p. 239. Fol. Vanda Nr. 3.:

V. (foliis coriaceis rigidis distichis), racemo longissimo pendulo flexuoso scabro-piloso, floribus maximis distantibus coriaceis, sepalis petalisque lanceolatis acuminatis valde undulatis extus scabris, labello parvo unguiculato triangulari glabro sub apice saccato acutissimo supra medium cornu refracto setaque sub apice aucto.

Wild in the forests of Borneo on high trees in very damp places—Low.

Flowers lemon-yellow, barred and blotched with bands and spots of the richest cinnamon, three inches in diameter, disposed in pendulous racemes ten to twelve

feet long. In some respects, especially in the minute simple unguiculate lip saccate near the point, and two-horned there, this resembles the genus *Arachnanthe*. The column is tomentose; the sepals and petals downy. All the plants which where imported are supposed to have perished: so that this noble species has still to be obtained for cultivators.

9. *RENANTHERA ROHANIANA* Rehb. fl. l. c.:

Sepalis tepalisque lanceolatis margine undulatis, labelli lobis lateralibus semiquadratis humillimis, lineis gyrosis interjectis inter utrumque supra angulum (calcar evanidum) in basi lobi medii carina inflexa simplici ligulata retusa ancipiti, ipso lobo bipartito, partitione superiori triangula aristata retrorsa, inferiori acuta triangula ascendente.

Pedunculus elongatus nigro hispidus (in praecedenti cinnamomeo hispidus); flexuosus, gracilis. Bracteae ovatae acuminatae nigro velutinae limbosae, extus hispidae, ovaria atrobrunneo hispida paulo superantes. Sepala ochracea purpureo guttata fuisse visa, quam in praecedente bene minora. Anthera transversa vertice minute cristata, vertice medio acute triangula, prope eadem, quae in *R. bilingui*. Caudicula apice latior, quam basi, obcuneata. Pollinia sphaerica extus fissa. Glandula peltata. Borneo Hupe.

En perpulchra species, quam nobilissimo principi Camillo Rohan, Botanices ac Horticulturæ fautori egregio et expertissimo grati animi signo annuente ipso obedienter dicavimus.

1474. **DIPLOCENTRUM** Lindl.

Bot. Reg. 1522.

1. *DIPLOCENTRUM RECURVUM* Lindl. Orchid. p. 218: Wight Ic. VI. (1851.) 1680:

Leaves folded, fleshy, recurved: racemes paniced, recurved, flowers small: spurs obconical, incurved, upper sepal and petals nearly equal, anterior sepals larger, unequal sided: lip ovate, entire, acute, much larger than the sepals; flowers deep pink, fining of on the margins to white, lip crimson.

Jyamally Hills. May—Sept.

2. *DIPLOCENTRUM LONGIFOLIUM* R. Wight Ic. V. I. (1851.) 1681:

Leaves linear, strapshaped, channelled, obtuse, oblique, the apex emarginate, racemes axillary, erect, sparingly branched, longer than the leaves: sepals and petals ovate, nearly all equal, obtuse; lip entire, undulated, obtuse or emarginate, capsules obovate, pendulous, connectivum prolonged into a flat very obtuse appendage with the cells at the base. Sepals and petals dull brownish, tinged with pink, lip dull pinkish-lilac.

On trees: Orange Valley, Neilgherries, also Jyamally Hills, fl. June. July.

3. *DIPLOCENTRUM CONGESTUM* R. Wight Ic. V.I. (1851.) 1682:

Leaves short, sub-elliptic, oblong, deeply emarginate or 2 lobed at the apex, racemes longer than leaves, axillary, sparingly branched, erect, manyflowered; flowers congested, small, sepals and petals ovate: lateral sepals oblique, larger than petals; lip ovate, tapering, truncated at the point; connectivum of anther prolonged, truncated at the apex; caudicula long subulate; gland very large, somewhat twolobed. Colour not preserved, but like preceding.

Jyamally, trees, rainy months. Rare.

1474 b/. **COTTONIA** Wight.

Wight Ic. V. (l.) 1851. 1755.

Perianth spreading. Sepals broad obovate, minute. Petals smaller, subnarrowly-cuneate at the base. Lip ecalcarate constricted in the middle, subpandoriform, upper half larger suborbicular, emarginate, cuspidate in the sinus; lower half orbicular bituberculate at the base. Column erect, clavate, margins dilated, membranous in front. Anther 2celled, with a long blunt rostellum. Pollinia 2, unequally twolobed, posterior lobes smaller; caudicle filiform; gland orbicular. Capsule long, clavate drooping.

Cauliscent epiphyte: leaves linear distichous obliquely emarginate, racemes short few-flowered, compact on the apex of very long branched peduncles: flowers pedicelled, flower buds globose. — I dedicate this genus to Major Frederic Cotton of the Madras Engineers, a most indefatigable collector and successful cultivator of Orchideous plants, and who has now a large and for India unique collection in his conservatory in Ootacamund. This genus seems to me to approach *Saccolabium* by habit, but different from all the genera of that tribe in the total absence of even an approach to a spur, by the form of the column, and still more by the unusual form of the lip.

1. **COTTONIA PEDUNCULARIS** Rehb. fil. in Catalog der Orchideensammlung von G. W. Schiller 1857. p. 22. *Vanda peduncularis* L. O. 216. *Cottonia macrostachya* Wight l. c. 1755. Malabar, near Tellichery, Jerdon, to whom I am indebted for a coloured sketch of the plant and the specimens from which the dissections were made.

Pact. Fl. G. III. 43. c. xyl.: Ceylon Read. Flowers pale green or yellowish, sweetscented, with a deep purple fleshy lip bordered with green and hairy at the edges so as to resemble some Ophrys. Growing in racemes, from 6—12 together from the thickened ends of peduncles, sometimes as much as three feet long and even furnished with side branches. In some respects this is not a true *Vanda*. The pollenmasses are absolutely double and not hollowed out on one side, the caudicula is unusually long and slender, and the lip is not saccate; flat, firm, fleshy. We do not however at present think it expedient to separate it, whatever may happen whenever the distichous leaved Orchids shall be sorrowfully reinvestigated. Labellum carnosum, margine tenerius, pollescens, utrinque leviter emarginatum, disco atropurpureo, sessile, immobile, linea mediana exarata pallida, in trianguli carnosii apicem desinente, basi auriculatum, etiam carnosius, tuberculo parvo barbato inter pubem ad basin trianguli inter auriculas, aestivatione ab apice involutum. Columna nana, erecta, tomentosa, antice utrinque unidentata; stigmati alte excavato, circulari. Anthera bilocularis antice membranacea, apiculo recurvo. Pollinaria 4 geminata, aurantiaca, deltoidea, in apice caudiculae longae, gracilis; glandula olivacea carnosae subrotunda.

2. **COTTONIA ?CHAMPIONI** Lindl. in Benth. fl. Hongk. Hook. Lond. J. VII. 35:

Foliis distichis apice bidentatis mucrone interjecto brevioribus, labello ovato apice setaceo bipartito.

Herba epiphyta, basi radicans. Folia alterna, disticha, coriacea, lineari oblonga, basi inaequali lobata, apice denticulata, bifida, apiculata. Racemi pauciflori, folio oppositi. Flores dilute lutei, columna pallide violacea. Perigonii ringentis foliola aequalia, oblonga, dorso carinata, interiora angustiora. Labellum semi-cymbiforme, breve, processu apiculatum apice furcato, brachiis setaeformibus terminante, ecalcaratum. Columna brevis, dilatata, fornicata. Anthera bilocularis, erecta, bidentata; pollinia 4, caudicula lineari subulata. Mountains of Hongkong. On Victoria Peak, in April. (Champ.) The labellum of this Orchidaceous plant (otherwise inconspi-

cuous) is very remarkable, being semi-cymbiform, with a process at the extremity like a browsprit, ending in two setiform forks. In the midst of the confusion reigning among the Sarcanthoid Vandeeæ, it seems probable that Dr. Wights' *Cotonia* (his *C. macrostachya* is *Vanda peduncularis* Lindl.) is a good genus; and in that case the present plant appears to be included in the definition. Major Champion believes that he saw a larger-flowered species of the same genus in Mr. Braine's garden, supposed to come from Canton.

1476. **CAMAROTIS** Lindl.

L. O. p. 219.

1. **CAMAROTIS** OBTUSA Lindl, Bot. Reg. XXX. (1844) Misc. 71:

Labello calceiformi lobulo terminali truncato obsolete tridentato inflexo intus appendice biloba canaliculata aucto, columna torta, rostello ungue labelli vix longiore.

India. Dull dirty rose-coloured flowers with a yellow lip. Much larger flowers, than in *C. purpurea*, but by no means so handsome. The little lobe at the end of the lip is fleshy, slightly 3lobed and furnished with a singular 2-lobed, channelled appendage. The column is twisted half round, as in *Mormodes*.

2. **CAMAROTIS** ROSTRATA Rchb. fil. *Aërides rostratum* Roxb. Fl. Ind. III. 474. *Camarotis purpurea* L. O. l. c. Lindl. Sert. 19. (1838):

Leaves linear, 3" long, 4—5" broad, coriaceous, slightly curved, 2—3—4 denticulate. Stem 2edged. Racemes opposite the leaves, straggling, longer, or shorter than the leaves. Flowers purple, spread open. Pedicels $\frac{1}{2}$ ". Sepals and petals purple, petals same shape as the dorsal sepal, darker. Lip is narrow, channelled at its base, united at its back for more than half the length to the lateral sepals; furnished at the apex with a hollow conical chamber having a narrow oval aperture, from the anterior edge of which a short subulate process proceeds and lies down over the orifice; in all respects of a deeper purple than the other segments of the perianth; otherwise the lip may be described as three-lobed with the lateral lobes united by their faces except near the point, which is inflated and extended into a hollow obconical chamber, over the aperture into which the intermediate subulate lobe is inflected. The column is very short, round, with the rostell prolonged into a conical subulated beak, emarginate at the apex, many times longer than the column. Anther placed upon the back of this beak, in such a way, that while it terminates the column, it is almost inverted in position by the ascending direction of the beak, prolonged at the point into a thin, narrow, sharp appendage, not quite 2-celled. Pollen-masses 2, globose, attached to the end of a long subulate caudicle, which adheres to a dilated peltate gland. Lip is distinctly chambered at the point! Dr. Rchb. says, that before expansion the beak of the column is lodged in this cavity of the lip.

Obs. *Mixtura ex Camarotidis floribus ac foliis cauleque Dendrobii, crumenati? (vidi typum!):*

Saccolabium fasciculatum Lindl. Hook. Bot. Journ. II. 238:

Caule erecto distiche folioso, foliis ovatis amplexicaulibus, obtusis oblique emarginatis, panicula nuda ramis simplicibus virgata, ad nodos apicem versus gemmas paleaceas floridas gerentibus, floribus e gemmis erumpentibus (parvis) ringentibus, sepalis lateralibus obovatis apiculatis, supremo lineari oblongo concavo, petalis linearibus obtusis apice subdenticulatis, labello porrecto conico leviter arcuato lobis lateralibus obtusis erectis, intermedio triangulari carnosio, rostello elongato sigmoideo.

In foliage this species has the habit of *Epidendr. elongatum*, but its inflorescence is quite peculiar. The stem, which is a foot and a half long, at its end becomes leafless, and divides into several rod-like branches, each a foot or so in length.

Their branches are too leafless, clusters of membranaceous bracts such as we find in certain species of *Pleurothallis* and *Dendrobium*. From amongst these bracts emerge the flowers, which are small and rather fleshy. New Guinea Mr. Hinds.

1476/1. **STAUROPSIS** Rehb. fil.

in Otto Hamb. Gartenztg. 1860. p. 117. e. p.

1. **STAUROPSIS PHILIPPINENSIS** Rehb. fil. Huc: *Trichoglottis philippinensis* Lindl. Ann. N. H. XV. 1845. p. 386:

Foliis subrotundo ovatis emarginatis mucrone interjecto, sepalis oblongo-lanceolatis patulis, petalis reflexis linearibus brevioribus, labello esaccato pubescente secus axin villosa oblongo convexo apice hastato trilobo dentibus baseos brevibus rotundatis.

Philippinen. (Cuming).

A plant with the habit of a *Vanda*, both with very short, roundish, leathery, somewhat imbricated leaves. The flowers are solitary in the axils, an inch and a half from the point of the dorsal sepals to that of the labellum. The species differs from Blume's fig. and descript. in not having a very short spur or sac at the base of the lip, but in nothing else that seems essential.

1479. **MICROPERA** Dalzell.

Hook. Journ. III. 282.

(nec Lindl. O. 219. — quae *Camarotis*.)

1. **MICROPERA MACULATA** Dalzell l. c.:

Subcaulis foliis planis lineari oblongis basin versus angustatis apice obliquis emarginatis, cum mucronulo; racemis basilaribus vel axillaribus simplicibus solitariis elongatis erectis multifloris a basi floriferis, foliis duplo longioribus, sepalis petalisque subaequalibus obovatis basi liberis, labelli albo et roseo picti utroque margine cornuto, cornubus reclinatis columnam aequantibus, calcare perianthio brevioris saccato obtuso, porrecto, intus piloso, laminae 3-lobatae brevius cucullatae supposito. Capsula oblonga $1\frac{1}{2}$ pedes, diam. 4—5 l., cernua, 6-sulcata. angulis obtusis. Flores 4—5 l. diam. Sepala et petala lutea, medio macula purpurea notata. Sepala lateralia patentia, petala cum sepalo supremo erecta, conniventia. Pollinia inaequalia bipartibilia. Folia 4—5 pollices longa, 1 lata. Crescit in arboribus prope Tulkut, in montis Syhadrensis lat. 16°. Fl. Majo — meo judicio forma aberrans, dubia.

1479. b/ **BROMHEADIA** Lindl.

Bot. Reg. XXVII. 1841. Misc. 184.

Perianthium (candid.) sesquipollicare, cylindraceo connivens, laciniis omnibus lineari oblongis curvis canaliculatis obtusiusculis. Labellum cucullatum, 3-lobum, cum columna omnino parallelum, basi inarticulatum; lacinia intermedia retusa flavescens disco luteo-glandulosa, lateralibus ovatis brevioribus violaceis; axi elevata pubescente. Columna luteo alata, obtusa, carnosa. Anthera bilocularis, longitudinaliter dehiscens, dorso conica et cum columna articulata. Pollinia 2, reniformia, postice excavata, in glandulam latam triangularem membranaceam sessilia.

1. **BROMHEADIA FINNLAYSONIANA** Rehb. fil. Walp. Ann. Ann. VI. p. 630. *Grammatophyllum?* *Finnlaysonianum* L. O. 173. *Br. palustris* Lindl. l. c.:

Herba parasitica caulescens, ebulbis. Folia disticha oblongo linearia emarginata. Spica terminalis, disticha, flexuosa, multiflora, longepedunculata, bracteis brevissimis, rigidis, dentiformibus. Lindl. B. Reg. XXX. 1844. 18. Hook. B. Mag. 4001. Wight l. c. 1740.

1480. **SACCOLABIUM** Bl.

Bjdr. 292.

I. Folia plana.

1. **SACCOLABIUM CALCEOLARE** Lindl. O. 223: Lindl. Sert. Front. 6:

Roots thick, smooth. Stem short, thick, compressed, entirely concealed by the sheathing bases of the leaves. Leaves close together in 2 rows, linear, coriaceous, smooth, 1' long, obliquely 1-2 toothed at the point, curved to one side as to assume a falcate appearance, thick, slightly channelled, convex midrib underside, their sheaths are short, compressed, finely dotted with purple. Corymb short stalked, solitary or twin, each consisting of from 10 - 16 flowers with a very thick, clavate peduncle 1½' long, spotted with purple. Flowers middle sized, yellowish green, elegantly sprinkled with roundish purple dots. - Sepals spreading, distinct, fleshy and stiff, somewhat obovate, obtuse, a little narrower at the base, about 4" long. Petals narrower, more round. Labellum large, bog-shaped, twice as large as the sepals, smooth, obtuse at the bottom, truncated and almost circular at the mouth, pale yellow; with a transverse plate of a somewhat reniform figure, inserted horizontally in front a little below the orifice of the labellum, white, yellow and spotted with purple in the middle and bearded above with white hairs. Column very short conical. Anther ovate, short, obtuse, with 2-cells, themselves half divided into 2 other cells in front extended into a long double toothed glandular process applied to the double toothed apex of the stigma. Pollenmasses 2, globose, with a little excavation one side, attached to a long slender caudicle. Nepal. Toca. Wallich.

B. Reg. XXIV. (1838.) Misc. 139: Chirra on the Khassee Hills. 400'. Gibson. - Wight Ic. 1671: Vanda pulchella.

2. **SACCOLABIUM ACUTIFOLIUM** L. O. 223. (*Aërides umbellatum* Wall. Mss. Ic. 1137.): Sert. I. c. Nr. 2:

Stems are 6" high, covered by numerous leaves in two rows. Each leaf 6" long, sessile, slightly amplexicaul, oblong-lanceolate, very acute, quite flat and even, and apparently fleshy. Flowers in small corymbs, placed on stiff peduncles, from 2-3" long, springing from the stem on the side opposite a leaf. They are about ¾" diam. Sepals and petals are obovate, acute, spreading, yellow, nearly of equal size. Labellum pale pink, concave at the base, where it has a rounded lobe on each side and flat beyond the lobes, enlarging into a somewhat triangular plate. Huc: *Saccolabium dentatum* Paxt. Mag. Bot. VII. 145. and B. Mag. 4772:

Caule repente radicoso, foliis linearioblongis acutissimis, racemis corymbosis folio brevioribus, sepalis petalisque subsimilibus obovato spatulatis patentibus, labelli calcare globoso amplo utrinque unidentato, perianthio aequali, laminae lato triangularis margine densissime glanduloso fimbriato, columna brevi denticulata. Khasya.

3. **SACCOLABIUM COMPRESSUM** Lindl. B. Reg. XXVI. 1840. Misc. 5:

Caule juniore ancipiti, foliis distichis amplexicaulibus undulatis obtusis oblique tridentatis, racemis cylindraceutis pendulis, labelli calcare falcato obtuso lamina carnosissima minima dentiformi sepalisque triplo longiore.

Manilla, Cuming, Loddiges.

Drooping cylindrical racemes with small sepals blotched with crimson and a long ivory-white spur.

Sert. 32. (1810.): Old stem round, hard, pushes forth greenish white roots. Leaves 6 - 10"; seegreen, broad, strapshaped, wavy, obtuse obliquely three-toothed at the end; at the base they surround the stem, form a sheath at the base, through which the raceme pierces nearly; distichous. Flowers small, scentless in long 3-sheathed racemes. Sepals oblong, rather acute, spotted with crimson upon a ground at first white, afterwards yellow the two at the side concave round the lab

till their points touch; that at the back forms an arch over the column which is very prominent at the back. Petals are similar in form, size, colour to the sepals, thinner, and spread at right angles from the column. Labellum chiefly consists of a long, hollow, falcate, obtuse, pendulous spur, which is free from all appendage, 3-lobed, side below being rounded, that in front more acute and fleshy. Column short, wingless, lengthened over the stigma into a narrow awl-shaped process (rostellum) to which pollenmasses adhere by means of a long, slender, subulate, channelled caudicle and minute gland. Anther rounded, rugged, extended in front into a long awl-shaped beak, which turns upwards, following the course of rostell. Pollenmasses 2, obovate, slightly split at the beak.

4. SACCOLABIUM RUBRUM L. O. 222. Huc *Saccolabium ampullaceum* Lindl. in Wall. Cat. 7307; Lindl. Sert. tab. 17:

Caule brevissimo, foliis crassissimis distinctis ligulatis canaliculatis apice truncatis dentatis, racemis oblongis erectis foliis multo brevioribus, sepalis petalisque ovatis patentibus subaequalibus, labello angustulo acuminato concavo, calcare compresso pendulo duplo brevior.

Sylhet. Roxbghs corresp. Bemphegy. May. Wallich.

Flowers deep rose colour in erect oblong axillary racemes. Flower — stalk and ovary about 1". Sepals and petals beautifully veined. Lip linear, falcate, twice as short as the sepals, channelled, acute, rather curved upwards at the point, with a compressed, straight, slender spur, about as long as the flower-stalk. At the base of the lip are 2 teeth, pressed close to the base of the column and parallel with it. Column short with a small hollow stigma. Anther purplish, 2-celled, ovate, obtuse, with a tooth transversely curved downwards beneath the pollenmasses on each side. Pollenmasses 2, globose, furrowed, with a long caudicle. Fig. copy. of pict. Court East Ind. Comp. — Distinguished from *Saccolabium rubrum* by its short erect racemes, by the form of the lip and by the leaves being regularly distichous, not at all curved to one side.

Rehb. fil. Bonpl. III. 225: Calcare anguste cylindraceo incurvo laminae aequali, callo utrinque bilobo inter lobos laterales, lamina ovata.

5. SACCOLABIUM RINGENS L. O. 221: „*Saccolab. rubrum* Lindl.“ Wight Ic. V. 1852. N. 1673:

Leaves channelled, bowed, bidentate at the apex, racemes erect, manyflowered, sepals and petals ovate, obtuse, spur of lip cylindrical, obtuse, incurved; lamina oval, acuminate, fleshy at the apex, bicorniculate at the base.

Flowers deep rose colour, leaves mottled with purple, pale on the under surface.

Neilgherries. I am not sure that I understand Lindley's character of the lip, especially the „base bicorniculate“.

6. SACCOLABIUM WIGHTIANUM L. O. 224. Cf. Walp. Ann. I. 791. Rehb. fil. Bpl. III. 225:

Calcare amplo subancipiti laminam labelli paulo excedente, carina emarginato biloba inter lobos laterales erecta, lamina ligulata.

Wight l. c.: Epiphyte on branches of trees. From the Pulneys. Flowers rose coloured. The specimen from which the species was originally taken up were far from good, and the character is unavoidably imperfect, but sufficiently so to leave little ground to doubt, that this is the plant. I have quoted Richard (*Aërides radicosum* Ann. sc. nat. Vol. 15.) with a doubt, though I believe unnecessarily, his description and figure agreeing so well with my plant. The erect not recumbent column and erect, not 3-lobed lip of this plant show that it is not referable to *Aërides*, at least as defined by Lindley.

Huc: *Aërides radicosum* A. Rich. Ann. sc. nat. 15 p. 65. Tab. l. c.:

Foliis equitantibus, oblongis, carnosiss, coriaceis, apice obtuse bilobis; floribus

rubro lilacinis, pedunculatis, racemosis, racemo longe pedunculato, simplici aut ramoso; bracteis brevissimis, basi latis, apice acutis; calcare recurvo; limbo trilobo, lobis lateralibus brevibus, obtusis; medio subcordato, obtuso.

Desc. Planta epiphyta; radix fibris longissimis constans, pseudobulbosa, folia disticha semi-vaginantia, coriacea, lanceolata, apice biloba, basi transverse secedentia; flores rubri aut lilacini in racemum simplicem aut ramosum, ex axilla foliorum ortum multiflorum dispositi. Sepala erecta, lateralia obliqua, basi cum labello coacta; superius liberum, interiora obtusa, erecta, exterioribus vix minora; labellum cum basi gynostemii parum producta continuum, nullo modo articulatum, oblongum, trilobum, basi calcaratum, membranaceum, lobis lateralibus brevibus, obtusis, lobo medio cordiformi, obtuso, venoso; calcare longitudine limbi obtuso, venoso; gynostemium breviusculum, marginibus membranaceum et cum labello continuum; anthera unilocularis, terminalis, operculata. Pollinia 2 globosa, postice sulcata, caudicula diaphana, angusta, glandula subrhoemboidea, peltata terminata, inflexa. Fructus ovoideus 3 alatus. Super cortic. arborib. parasit. in sylvis circa Otacamund. — Majo.

7. SACCOLABIUM PANICULATUM R. Wight Ic. V. l. (1851.) 1676:

Leaves strapshaped, somewhat channelled, obliquely 2-lobed at the apex; panicle racemose, many-flowered, much longer than the leaves; sepals and petals suborbicular obovate obtuse, petals smaller than the sepals, lip ovate attenuate towards the point, with 2 small suborbicular lobes at the base, and a fleshy, glandlike appendage closing the throat of the spur; spur conical, about the length of the lip. Flowers nearly white a light tinge of pink, lip shaded with crimson.

Iyamally Hills. Oct. Sept.

Approaches *S. niveum* Lindl. which is much smaller, its leaves being only $2\frac{1}{2}$ " long and $\frac{1}{4}$ " broad — large variety?

Rehb. fil. Bonpl. III. 225: calcar arcuato lamina breviori, callo utrinque bilobo inter lobos laterales, lamina ligulata.

8. SACCOLABIUM VIRIDIFLORUM Lindl. Contrib. Orchid. Ind. p. 36. *Micropera viridiflora* Dalzell in Hook. Kew 4. Misc. III. 282:

Pollicaris, acaulis, foliis planis lineari oblongis apice bilobis, racemis basilaribus brevissimis plurifloris foliis brevioribus, sepalis petalisque conformibus aequilongis obovato-spathulatis pallide viridibus, petalis erectis conniventibus, sepalis lateralibus patentibus, latelli calcaris perianthium aequante, porrecto calceiformi, laminae cucullatae submembranaceae 3-lobatae albae supposito, laminae lobis lateralibus rotundatis, intermedio triangulari acuto, cornubus in labelli margine utroque parvis conicis erectis, labelloque basi albo et roseo pictis.

Flores 5—6 l. diam., racem. 1—2 p. F. 3 p. lg., 6—8 l. l. Crescit cum *M. maculata*, fl. Majo. Diff. a *M. pallida* caule nullo.

9. SACCOLABIUM DENSIFLORUM Lindl. Orchid. 220. B. Reg. 1838. (XXIV.) Misc. 103:

Manilla, Cuming, flowered with Loddiges. It has small, pale, dull brownish yellow flowers, of a very fleshy consistence. The specimen, that flowered was a small one; the Penang spec. brought home by Dr. Wallish were nearly 2' high.

10. SACCOLABIUM GEMMATUM Lindl. B. R. XXIV. (1838.) Misc. 88:

Foliis distichis semiteretibus canaliculatis subtortis apice inaequaliter tridentatis, spica ramosa, floribus minutis carnosis, sepalis conniventibus ovatis obtusis lateralibus multo majoribus, petalis brevioribus subrotundis, labello carnosus ovato crystallino dorso tuberculato marginibus calcaris conici penduli dilatatis carnosis rotundatis, columna brevissima, apice antherae hemisphaericae reflexo.

Discov. 1837 on the Khoseea hills of India by Mr. Gibson, brought to Chatsworth (Duke of Devonshire). The blossoms are the smallest of the genus not being larger than a grain of mustard seed, but the finest amethysts are not of a more brilliant purple, and the tips of the labellum and sepals are quite white.

11. SACCOLABIUM BIFIDUM Lindl. Bot. Reg. 1838. (XXIV.) Misc. 5:

Racemo pendulo gracili multifloro, petalis basi obscure hastulatis, labello recurvo hastato, apice setaceo fisso; laciniis basi linearibus obtusis erectis.

Small, oblong, flat, distichous leaves, and a slender pendulous raceme, 4' long, of pale pink and yellow small flowers in the form of their lip not unlike our wild Man-Orchis. Loddiges received it from Manilla, where it had been collected by Mr. Cuming and flowered in December. — Flores parvi, Ribesios rubri magnitudine. Perianthium explanatum, ochraceum, sepalis linearibus obtusis; petalis minoribus, basi obsolete hastulatis. Labellum albidum, subrecurvum subtriangulare, apice setaceo-bifidum basi hastatum, lobis linearibus, obtusis apice purpureis, erectis, columna longioribus, calcare intus nudo cylindraco, ochraceo, apice compresso, pendulo, ovario duplo brevior. Columna nana, alis duabus linearibus obtusis porrectis stigma marginantibus. Anthera hemisphaerica, mutica, pellucida, antice truncata. Pollinia postice excavata ab apice brevi glandulae tenuis cuneatae acuminatae pendulae.

12. SACCOLABIUM QUINQUEFIDUM Lindl. in Hoek. Lond. Journ. of Bot. 1843. II. 238:

Foliis coriaceis distichis ligulatis (auriculatis) apice rotundatis oblique emarginatis, panicula ramosa ramis ascendentibus multifloris, floribus minutis, labelli quinquefidi lobo medio lineari obtuso lateralibus utrinque duobus acutis inaequalibus ascendentibus, calcare obtuso sepalis paulo longiore.

A plant with the habit of *Sarcanthus paniculatus* but with extremely small flowers. The leaves are coriaceous, shining, about 8" long by 1" broad. The panicle is 1½' long and fully 8" in diameter. There is no difference whatever between this and the common forms of *Saccolabium*. The genus *Carteretia* must therefore be cancelled. — Guinea Binds? Videtur.

Huc: *Carteretia* A. Rich. Voy. Astrol. tab. 4:

Perigonii foliola exteriora latiora basi oblique ascendente acuta, supremum paulo angustius, subconcaevum obtusum, interiora paulo minor, obtusa; labellum columnae parallelum, basi in calcar productum, tripartitum, laciniis erectis intermedia trifida, columna ovario continua, brevis, semiteres; anthera bilocularis antice apiculata, pollinia 4 incumbentia.

C. paniculata A. Rich. l. c.: parasitica, foliis radicalibus, oblongis (pedalibus), apice bifido bilobis, lobis obtusis glaberrimis, integerrimis inferne plicatis, scapo tereti superne ramoso (hipedali) vaginis quibusdam adpressis subobliquis vel truncatis brevibus, floribus in apice ramorum sparsis subspicatis, parvulis, dilute viridibus brevissime pedicellatis resupinatis, bracteola brevi persistente stipatis, calycis obliqui laciniarum exteriorum superiore subconcaeva obtusiuscula, lateralibus oblique ascendentibus, basi paulisper productis et inter se connatis, subovalibus, acutis, laciniis interioribus brevioribus, oblongis, membranaceis obtusissimis, labello concaevo basi cum gynostemio articulado.

13. SACCOLABIUM PUMILIO. Huc: *Oecoelades pusilla* Lindl. Orch. 237.

14. SACCOLABIUM FLEXUOSUM. Huc: *Oecoelades flexuosa* Lindl. Orch. 236.

15. SACCOLABIUM JERDONIANUM. Huc: *Taeniophyllum Jerdonianum* Wight l. c. 1756:

Caulescent; leaves linear; spikes ramous, manyflowered, bracts ovate, acute, exceeding the pedicels; sepals broad ovate, petals narrow, linear

lanceolate, spur large saccate, lip undulate, poll. 4, attached to a large elongated gland.

Malabar. Jerdon. On branches of trees. Really a *Taeniophyllum*?

16. *SACCOLABIUM WALKERIANUM*. Huc: *Sarcanthus Walkerianus* R. Wight Ic. V. (1851). 1686:

Erect? Leaves linear, channelled, strapshaped, very oblique and two-lobed at the apex; raceme erect, shorter than the leaves, few-flowered, flowers long pedicelled; posterior sepal larger, galeate, spur large (lip saccate) plates of the lip nearly obsolete, the anterior one toothlike. Flowers minute, pink with a bright green spot on the anterior lobe of the lip.

The larger pollenmasses red, the smaller ones yellow.

Nuera Ellia, Ceylon; on trees. Flowers August. Mrs. Walker. — No plate is the spur.

II. Folia teretia.

17. *SACCOLABIUM FILIFORME*. Huc: *Sarcanthus filiformis* R. Wight l. c. 1684:

Pendulous, leaves terete, filiform, racemes ascending, much shorter than the leaves, narrow lanceolate, posterior one larger, petals ovate, orbicular, obtuse, much larger than the sepals, lip three-lobed, lateral lobes erect, obtuse, middle one ovate, acute, reflexed, spur slightly recurved, obtuse, as long as the flower, capsule sub-cylindrical, clavate. Flowers orange-yellow, streaked with darker crimson lines.

Anamally forests, pendule from branches. Sep. Oct. Cotton. (Civil Engineer.)

Capsula huc?

Timeo, ne sit lusus ejusdem plantae:

Sarcanthus roseus R. Wight l. c. 1685:

Pendulous leaves round, subulate, of very firm hard texture; raceme spicate, ascending, compact; anterior sepal lanceolate, acute, posterior one linear obtuse, petals broad, orbicular, spur of the lip straight, inflated at the point, produced into an ovate fleshy plate with a large globose callosity at the base, gland of pollen large, capsule small, ovate. Flowers rose coloured, petals green at the base within.

Neilgherries, near Neddawullim. Aug. Sept. — No plate in the spur!

1480/b. **RHYNCHOSTYLIS** Bl.

Bijdr. 286.

1. *RHYNCHOSTYLIS RETUSA* Rehb. fil. Me judice tota copia varietatum innumeris lusibus transitus offert, ut ex foliorum apicibus ac labellis nullos possis evincere characteres.

a. guttata: foliis oblique seu recte retusis. *Rhynchostylis guttata* Rehb. fil. Bonpl. II. 93. — Lindl. Ser. sub 47. (sub *Saccolabio guttato*.) De Vries. Illust. t. 14. — *Rhynchostylis retusa* Bl. Bijdr. 286.

b. praemorsa: foliis apice praemorsis. *Rhynchostylis praemorsa* Bl. l. c. — *Saccolabium Blumei* Lindl. Pescat. tab. 21.

Saccolabium Blumei Lindl. B. Reg. XXVII. 1841. Misc. 115:

Foliis longis canaliculatis arcuatis acutis mucronatis, racemis pendulis densifloris obtusis aequalibus, sepalis ovatis, petalis oblongis duplo angustioribus, labelli calcare compresso obtusiusculo intus pubescente, lamina oblonga rotundata ciliata emarginata utrinque costata.

Beautiful. Obtained from Java by Loddiges and in all probability the *Rhynchostylis retusa* of Blume. Very near *Saccolabium guttatum*, but the racemes are shorter and thicker, the leaves are acute, not unequally terminating in a kind of mucro, truncate, and the flowers are very differently pointed; each sepal and petal has a bright streak of violet below the apex, and the lip is deeply stained with the same colour except the tip which is white.

Saccolabium Rheedii R. Wight Ic. V. (1851). 1745. 1746. (tab. sign. *Saccolabium guttatum*): leaves linear, channelled, denticulato truncated or premorse at the apex; raceme pendulous densely manyflowered, posterior sepal ovate, lateral ones unequal sided, about twice the breadth of the lanceolate acute petals; spur saccate, conical, hairy on the throat, lamina of the lip broad, obcordate cuneate, spreading, capsula obovate subterete. Flowers pale pink dotted with deeper coloured spots, lip deeper pink.

c. *macrostachya*: foliis rotundatis.

Saccolabium macrostachyum Lindl. Sert. sub 47. 1841. (*Rhynchostylis retusa* Blume Bijdr. 286):

Foliis longis ligulatis apice rotundatis emarginatis racemis pendulis longissimis multifloris brevioribus, sepalis oblongis, petalis duplo angustioribus, labelli calcaris compresso, lamina oblonga unguiculata obtusa.

Phillippines. Manilla. (Cuming.) Java.

2. RHYNCHOSTYLIS VIOLACEA Rehb. fil. Bonpl. II. 93. Huc: *Saccolabium violaceum* Rehb. fil. in lit. et l. c. Huc: *Vanda violacea* Lindl. B. Reg. XXVII. (1841.) Misc. 32. — 1847. t. 30:

Foliis canaliculatis oblique abscissis rotundatis, racemis multifloris densis pedunculatis, sepalis obovato-oblongis obtusis planis incurvis, petalis multo angustioribus, labello oblongo apiculato plano, venis 5 crassis, sacco intus pubescente.

A pretty epiphyte sent from Manilla. Loddiges. The flowers are in short racemes rather large, with an ivory white ground spotted with bright violet; of the latter colour there is one large blotch within the extremity of each sepal and petal, and a few small dots are scattered over their surface; the lip is wholly violet. The flowers have a faint and rather disagreeable smell.

3. RHYNCHOSTYLIS GURWALICA Rehb. fil. Huc: *Saccolabium gurwalicum* Lindl. Ind. Orch. Cont. II. p. 33.

1482. **CLEISOSTOMA** Bl.

Bjdr. 362. Tab. 27.

1. **CLEISOSTOMA ROSEA** Lindl. Bot. Reg. XXIV. (1838.) Misc. 150:

Caule folioso, foliis anguste lanceolatis coriaceis acutis, corymbis paucifloris subsessilibus, sepalis lateralibus oblique ovatis acutis, supremo petalisque linearibus obtusissimis, labello carnoso lobo medio rotundato lateralibus crassissimis transverse truncatis, dente operiente lineari acuto.

This little plant has small pale straw-coloured flowers with a pink lip, and in habit resembles *Sarcanthus rostratus*. It was sent by Mr. Cuming to Mrs. Loddiges from Manilla.

2. **CLEISOSTOMA MACULOSA** Lindl. O. 227. B. R. XXVII. (1840.) Misc. 67:

Habit of a small *Vanda*, with longstalked spikes of small yellowish brown and pink roundish fleshy blooms. Ceylon Lodd. imp.

3. *CLEISOSTOMA DECIPIENS* Lindl. B. Reg. XXX. (1844.) Misc. 16 :

Foliis distichis loratis oblique emarginatis leviter undulatis, spicis recurvis compositis, sepalis petalisque oblongis rotundatis, labelli lamina rotundata transversa sacco subventricoso pubescente.

This little epiphyte, which was received from Ceylon by Col. Fielding, is so like *Saccolabium micranthum*, that it might be easily mistaken for it. The one is however a genuine *Saccolabium*, the other a true *Cleisostoma*. *S. micranthum* has pink flowers with a tooth proceeding from the base of the blade of the labellum; *C. decipiens* has dirty ochre coloured flowers with a tooth springing from the back of the spur just below the column. It is an insignificant plant.

4. *CLEISOSTOMA LATIFOLIUM* Lindl. B. Reg. XXVI. (1840.) Misc. 127 :

Foliis oblongis obtusis apice subaequalibus bilobis, floribus paniculatis; ramis simplicibus rigidis, petalis sepalisque linearibus obtusis, labelli calcare ventricoso lamina reniformi dente membranaceo bilobo.

A Vanda-like O. from Singapore. Lodd. imp. Very like *Cl. latifolium*, but has broader leaves and there are differences in the form of the labellum. Its flowers are yellow bordered with red, small and densely arranged. It is pretty, but not strikingly so.

5. *CLEISOSTOMA FUSCUM* Lindl. Journ. Hort. Soc. V. 80 :

Foliis oblongis distichis canaliculatis apice rotundatis emarginatis, pedunculo elongato multo brevioribus, panícula parva contracta, brachiis basi nudis, floribus congestis subcorymbosis, sepalis petalisque oblongis obtusis, labelli trilobi laciniis lateralibus erectis rotundatis intermedia ovata acuta laevi, calcare intus antice carnoso gibboso dente dorsali plano erecto truncato eroso.

Leaves 9 inches long, by $1\frac{1}{4}$ broad. Flowers dull, dingy, yellowish brown, much like those of *C. latifolium*, in a close panicle, on a long, dusky peduncle, fleshy and numerous. Sepals and petals oblong, spreading, very obtuse; lip yellow with a blunt sac; its front division ovate and flat, the side ones shorter, rounded, erect. Inside is a large fleshy callus, which projects into the cavity; the dorsal tooth is like that of *Cleisostoma latifolium*, except that it is shorter and truncate, not bifid. Perhaps a mere variety of it.

6. *CLEISOSTOMA BICOLOR* Lindl. in Paxt. Fl. G. II. 99, Xyl. 185 :

Scapo elongato simplici apice tantum florido, sepalis lateralibus truncatis angulatis, intermedio parvo ovato decurvo, calcare crasso brevi scrotiformi saccato, appendice membranacea triangulari bidentata.

Upper sepals linear, oblong, straight; lateral more blunt, falcate, rounded. Flowers pink and yellow. — Manilla.

7. *CLEISOSTOMA LANATUM* Lindl. Journ. Hort. Soc. IV. 164. (1849) :

Foliis latis obtuse bilobis, racemo denso ramoso foliis multo longiore, bracteis ovatis concavis reflexis, rachi et ovario lanatis, sepalis carinatis, labelli didymi scrotiformis glaberrimi lobis erectis acutis intermedio ovato concavo bisetoso, caudicula cuneata bifida elongata.

Racemo much longer than the leaves. Flowers very small. Ind. Continent.

8. *CLEISOSTOMA CRASSIFOLIUM* Lindl. Paxt. Fl. G. III. tab. 99. p. 125 :

Foliis carnosis canaliculatis arcuatis rigidis, paniculae simplicis ramis dense spicatis nutantibus, labelli lobis lateralibus minutis erectis intermedio subrotundo dente utrinque runcinato, calcaris dente parvo obtuso carnoso.

Veitch. — Moulmein? — Lem. Jard. Fl. t. 397.

9. **CLEISOSTOMA CALLOSA** Bl. Bjd. 362. Rehb. fil. Bonpl. III. 219. (*Pomatocalpa spicatum* Kuhl und van Hasselt):

Folium loratum apice obtuse et inaequaliter bilobum, torsione verticale, septem pollices longum, duos latum. Pedunculus carnosus viridis purpureo guttulatus. Bractee lanceae reflexae, inflimae ovariis vix breviores. Sepala et petala carnosa ligulata obtusa subpatula. Labelli saccus obtuse peruliformis; lobi laterales supra ostium erecti retusi, lobus medius ovatus acutus. Callus geminus aureus in ostio antico calcaris pone ipsam lobi medii basin; lacinia postica exorta in parte superiori parietis postici, ascendens antrorsum linearis, apice retuso erosulo denticulata. Gynostemium humile, crassum. Androclinium immersum. Rostellum apice bidentatum. Anthera dilatata in apicem triangulum subito contracta. Pollinia depresso globosa, extrorse sulcata in pariete postico. Caudicula linearis. Glandula elliptica arrecta. Perigonium carnosum, stramineum, guttulae striaeque atropurpureae quaedam in sepalis externe, praecipue in basi. Flores illis Saccolabii micranthi subaequales. Aus Java, cultivirt zu Herrenhausen.

10. **CLEISOSTOMA DISCOLOR** Lindl. Bot. Reg. XXI. 1845. Misc. 61:

Foliis oblongis canaliculatis oblique truncatis, racemo paniculato, labello trifido utrinque plicato lobo medio carnosus obtuso, intus bituberculato dente dorsali indiviso carinato, calcare oblongo obtuso.

A little inconspicuous plant obtained from India by Mrs. Loddiges. The flower-stem is long, slender, dull purple and branched at the extremity. The sepals and petals are dull yellow, with a green tinge, the spur is nearly white.

11. **CLEISOSTOMA AMABILE** Tijsm. and Binnd. Naturk. Tijdsr. Ned. Ind. 1853:

Caulescens, foliis lanceolatis distichis apicibus contractis subulatis carnosus, spicis pendulis, phyllis perigonii externis obovatis obtusis, internis minoribus, labelli calcare calceoliformi limbo sagittato.

Salak.

12. **CLEISOSTOMA LONGIFOLIUM** Tijsm. and Binnd. Naturk. Tijdk. Ned. Ind. 1853:

Caulibus pendulis, foliis loricatis apice inaequali retusis, racemis densifloris, phyllis perigonii ovatis acutis supremo obtusiusculo, labello saccato carnosus dentato inflexo intus bicornuto.

1458. **ECHIOGLOSSUM** Bl.

Bijdr. 364. Tab. 28.

1. **ECHIOGLOSSUM MUTICUM** Rehb. fil. Bonpl. III. 225:

Labelli lobo medio sessili hastato apice retuso linea media basilari ecarinato.

Panicula gracilis. Pedunculus atroviolaceus viridimaculatus glaber minute bracteatus. Ovarium pedicellatum bractea multo longius. Perigonium carnosum illi Sarcanthi rostrati subaequale, atroviolaceum albidumque (ex floribus jam valde emarcidis). Sepala et tepala angustiora oblongoligulata angusta obtusa. Labellum basi ima gynostemii lateribus adnatum prope eboraceum: partitiones laterales falcatae tumoribus in calcar cylindraceum pedicello aequilongum descendentes; callus canaliculatus ligulatus apice utrinque sigmoideus, utroque latere pulvinari puberulo auctus in pagina postica calcaris. Gynostemium semiteres, oblique retusum; androclinium triangulum, supra foveam utrinque lobo descendentem bicurvis; labium semicirculatum sub fovea productum. Caudicula triangula bicurvis crure utroque apice libero retuso viscoso. — Seit 1826 war *Echioglossum* verschollen. Von Java eingeführt von Herrn Consul Schiller.

2. ECHIOGLOSSUM QUARTUM:

Sepalis extus verruculosus, summo fornicato, tepalis ligulatis obtuse acutiusculis, labelli laciniis posticis semiovato rhombeis erectis, lacinia media hastato triangula uncinata, carina serrulato denticulata per medium in septum calcaris prope completum descendente, calcaris conico, tumore sub columna maximo. — Java. Lobb.

1489. **SARCANTHUS** Lindl.

Coll. Bot. t. 39. B.

a. Folia teretia.

1. **SARCANTHUS FILIFORMIS** Lindl. B. Reg. XXVIII. (1842.) Misc. 69:

Foliis filiformibus, racemis 7—8-floris, sepalis petalisque reflexis, labello apice ovato fauce utrinque bidentata, apice calcaris didymo, columnae facie glabra.

Flowers very small, chocolate coloured sepals and petals and a pale yellow lip tipped with pink. Near *S. teretif.* India imp. Wallich. — Hook. B. Mag. 4639. — Lem. l. c. t. 266.

2. **SARCANTHUS TERETIFOLIUS** L. O. 234. B. M. 3578.

b. Folia plana.

3. **SARCANTHUS RACEMIFER** Rehb. fl. Mss. Huc: *Saccolabium racemiferum* L. O. 224. — *Sarcanthus pallidus* Lindl. Bct. Reg. XXVI. (1840.) Misc. 185:

Foliis distichis coriaceis ligulatis apice oblique retusis, panicula multiflora ramosa multo brevioribus, labelli lobo medio solido tereti incurvo.

India, sent by Gibson for the Duke of Devonshire. Foliage of *Aerides odoratum*. Flowers are small, pale, by no means beautiful, although extremely numerous and arranged in a panicle a foot and a half long. They are about the size of *S. teretifol.*, of a dirty greenish white, with a faint purple streak through the middle of each sepal and petal and with the intermediate lobe of the lip dull yellow.

Huc: *Sarcanthus tricolor* Rehb. fl. Bonpl. III. 219:

Aff. *S. paniculato*, floribus duplo minoribus, lobis labelli posticis cuspidatis, lobo medio triangulo laevi, calcaris ostio nudo.

Habitus *S. paniculati*. Folia magna rigida. Panicula valde effusa. Flores minuti illis *S. rostrati* aequales. Sepala ligulata et tepala dimidio minora atrofusca, flavo marginata et aequae per medium striata. Labellum de lateribus gynostemii descendens, antrorsum trilobum. Lobi laterales dentes cuspidati, lobus medius triangulus excavatus apice acuto inflexo; calcare cylindraceo didymo, callo triangulo basi inferiori emarginato per discum uniearinato in ostio superiori calcaris laevis. Cultur der Herren Booth und Söhne in Flottbeck, jetzt im Besitz des Hrn. Consul Schiller

Obs. Lobus medius labelli ab ill. Lindley falsissime teres dictus, dum triangulus depressus. Hinc speciem iterum descripsi.

4. **SARCANTHUS PENINSULARIS** Dalzell in Hook. Kew. G. Misc. III. 343:

Caule simplici tereti flexuoso folioso pendulo, foliis lineari acuminatis crassis coriaceis subtriquetris, racemis oppositif. folio dimidio brevioribus, labelli calcare perianthii longitudine cornuto, obtuso, pendulo complete biloculari, fauce callis duobus clausa, limbo brevi integro ovato obtuso crasso carnosio erecto, facie interiore sulcato perianthio brevior.

Perianthium subpatens, diam. 5 lin. Sepala et petala conformia, obovata, flava, purpureo marginata; sepalum supremum in columnam incumbens. Pollinia bipartibilia, glandula in appendice rostellii horizontalis sphaerica. Dentes in labelli utroque margine parvi, truncati. Labellum b. albo violaceo pictum. — Crescit in arboribus pr. vicum Virdee in regno Warreensi; fl. Jul. et Aug.

Huc: *Sarcanthus pauciflorus* Wight Ic. V. (1851.) 1747:

Leaves linear, acute; spikes simple, pendulous, few flowered, much shorter than the leaves; sepals obovate, acute or somewhat boatshaped, inflexed on the margins: petals narrower, obovate lanceolate; spur in-tundibuliform, conical, curved outwards; lamina of the lip 3-lobed, lobes all obtuse, the middle one much shorter, larger.

Sepals pale yellow, with a red margin, lip white or slightly tinged with yellow. Malabar. Jerdon.

5. SARCANTHUS OXYPHYLLUS Wall. in B. Reg. XXVI. (1840.) Misc. 123:

Calcutta imp. flowered in the garden of the Hort. soc. and proves to be nothing more than a narrow-leaved variety of *Sarcanthus rostratus*, a species of no beauty, long since introduced by the Hort. soc. from China.

6. SARCANTHUS DEALBATUS Rehb. fl. Mss. Huc: *Cleisostoma dealbatum* Lindl. B. Reg. XXIX. (1843.) Misc. 5:

Foliis linearibus canaliculatis carnosius dealbatis, spicis simplicibus glaucis, sepalis petalisque rotundatis, labelli calcare ovato emarginato lobis lateralibus acutis intermedio ovato carnosio multo majore incurvo, columnae dente bilobo.

An O. pl. of little beauty, obtained from Manilla by Messrs. Loddiges, through Mr. Cuming. — The flowers before they expand are almost white, when open they are bright yellow, with a white lip; but they are too small to produce much appearance.

7. SARCANTHUS PUGIONIFORMIS Rehb. fl. Huc: *Angraecum pugioniforme* Klotzsch Mss. in Ind. sem. Berl. 1853:

Caulescens; foliis distantibus, lanceolatis, crassis, coriaceis, uncostatis, basi attenuato-excavatis, margine tumidis, apice pungentibus; spica oppositifolia, pendula, versus apicem incrassata, multiflora; bracteis persistentibus, minutis, ovatis, acutis, fuscis, patentibus; floribus parvis, sessilibus; perigonii foliolis anguste obovatis, brevissime acutis, ex albido-flavescentibus, sordide rubro-bistriatis, interioribus paululum minoribus; labello subcarnoso, trilobo, calcarato, lobis lateralibus acutissimis rectis flavescentibus, lobo medio dilute lilacino cavo acuto; calcare pendulo, conico, emarginato, albo, ovarii longitudine; gynostemio albo, perbrevis; pollinariis 2 orbicularibus, bipartibilibus; caudicula filiformi; glandula alba, bipartita.

Caulis compressiusculus, crassitudine pennae cygnae, 9 pollices longus. Folia primum conduplicata, deinde plana, 8 pollices longa, 6—7 lineas lata, atro-viridia, costa subtus prominente. Spica 7 pollices longa. Flores 4 lineas in diametro. Germen 2 lineas longum.

Coracas. Wager.

Obs. Ipsissimus Cl. Bouché, inspector Horti Schoenebergensis me certiore fecit, plantam a domino Low Loudinensi indicam missam fuisse. Locus caracasanus igitur omnino aequae fictus, ac tot alia.

Rehb. fl.

1490. **PODOCHILUS** Lindl.

Orch. 234.

(*Podochilus* Bl. Bjd. 295. — *Platysma* Bl. Bijdr. 295. — *Apista* Bl. Bijdr. 296.)

1. **PODOCHILUS MALABARICUS** Wight l. c. 1748. 2

Leaves short, fleshy, imbricating, obtuse; spike terminal, short, few-flowered, drooping, bracts broad ovate, somewhat cuspidate, shorter than the ovary, petals somewhat narrower than the sepals, lanceolate, lateral sepals connate forming a short ventricose spurious spur; lip entire, constricted in the middle, upper half linear lanceolate, obtuse.

Malabar. Jerdon.

1491₁. (Endl.: 1369₂). **APPENDICULA** Bl.

Bijdr. 297. Tab. 40.

1. **APPENDICULA MICRANTHA** Lindl. Ann. N. H. V. 1845. p. 386:

Foliis distichis, ovato-oblongis obtusis, spicis axillaribus solitariis nutantibus folio brevioribus, bracteis subulatis reflexis, labello ovato acuto.

This has the smallest flowers of any, I have examined. It is near Blume's *App. reflexa*, which is said to have an obtuse mucronate lip.

-2. **APPENDICULA BIFARIA** Lindl. Hook. Lond. Jour. VII. 35 :

Foliis bifariis oblongis emarginatis mucronulo interjecto, floribus terminalibus, labello oblongo appendice circulari membranacea et dente ovato in laminam.

Dendrobium bifarium Wall. Lindl. gener. et sp. Orch. p. 81.

Dendrobium emarginatum Reinw. ic. ined.

Tolerably abundant in ravines of Mount Gough, in August. Among the plants I include under the present name, the specimens, that have come under examination being generally destitute of flowers. The definition given is made to suit the plant found by Major Champion the flowers of which I have insufficiently studied. Major Champion says they are pure white; Reinwardt's artist represents them as large and stained with rosecolour, and his leaves resemble those of the Philippine form. Rumphius' *Angraecum purpureum primum*, referred here in the „genera and species“ although an *Appendicula*, belongs to one of those with lateral inflorescence. Griffith's Mss. has made him give two totally different plants, and he says that one of them comes from Afghanistan! a country, in which no epiphyte is capable of existing.

Obs. Haec sint. Equidem in ipsissima Lindleyi domo notavi: „*Dendrobium bifarium* est *Appendicula* haud extricanda, similis „*Dendrobio manilensi* Schauer.“

3. **APPENDICULA LEWISII** Griff. Calc. Journ. IV. 1844. p. 378:

Caulibus ancipitibus simplicibus, foliis anguste lanceolatis bifidis cum mucrone interjecto, racemis oppositifoliis, foliis brevibus, labelli erecti lamina oblongo cordata, processu sacci semi-cyathiformi antice deficiente, sacco laminam longitudine aequante.

Habit.: Insula Penang.

Descr. Caulis spithameus, vel subpedalis, anceps. Folia bifaria, anguste lanceolata, inaequaliter bifida, mucrone interjecto, univenia, pallide viridia. Racemi oppositifolii, subcernui, pauciflori, foliis breviores. Flores minuti, resupinati, albi. Bractee membranaceae, angustae, ovarii longitudine. Perianthium connivens, membranaceo-cellulosum. Sepala oblonga, subacuta, lateralia basi valde obliqua et cum

pede columnae connata. Petala conformia, paullo minora. Labellum suberectum, cum columna valde continuum; lamina integro ovato-cordata, acuta; saccus magnus rotundatus, auctus processu semicyathiformi medium versus affixo postice libero. Columna nana basi longe producta, sursum purpureo fusca. Clinandrium profunde excavatum dente postico, antheram affingente magno, introflexo. Anthera ovato-cordata, membranacea, subimmersa, in stigmatate postico rostello incumbens bilocularis, antice tridentata. Pollinia 8, clavata, cerea, in glandula oblonga carnosa sessilia. Stigma posticum (rostellum) obliquum, sublinguiforme, bifidum; stigmatidis apertura verticalis. Capsula oblonga, tricostata, pallide brunnea

Flos habitusque Sarcanthorum, columna et stamen Neottiarum.

This species may perhaps be Blume's *Appendicula anceps*, but his characters are too short and have little reference to the flowers to admit of his species being determined with any satisfaction. I have therefore dedicated it to Mr. Lewes, Assistant Resident, Penang, who introduced it with other plant into this garden, where it flowered, March last. It appears to thrive in pots with leaf soil mixed with broken pots.

4. APPENDICULA PURPURASCENS Bl. Bijdr.: De Vriese Illust. t. 12, fig. 1.

5. APPENDICULA MEMBRANACEA Tijssm. and Binned. Natuurk. Tijdsch. N. Ind. V. 1853:

Caulibus compressis, foliis oblique emarginatis, obtusiusculis, floribus foliis oppositis subsessilibus geminatis, phyllis perigonii linearilanceolatis, labelli limbo trilobato acutiusculo reflexo, capsula obovata, carnosa. — Salak.

Obs. 1. Hujus generis:

Dendrobium (Onychium Bl.) manilense Schauer Act. Leop. XIX. Suppl. p. 430. (1845):

Glabrum, caulibus teretibus erectis vaginis laxis indutis, foliis bifariis oblongis (planis striatis) apice obliquis emarginatis mucronatis, racemis paucifloris axillaribus cernuis, folia adaequantibus, bracteolis ovatis acuminatis, flores fere occultantibus, sepalis inf. ovatis acuminatis basi obliquis et ad medium tenus connatis in calcar subsemiaequans obtusum saccatumque, sepalo superiori petalis latiori, paulo longiori, labello angusto canaliculato (?) columnam aequante medio contracto hinc in limbum ovatum acuminatum discoque crista longitudinali bicarinata insignitum dilatata.

Lucon agr. Manil. Octobri.

Herba epiphyta, semipedalis. Folia 8—12 lineas longa. Flores minuti, albi, labelli apice discolori, saturatori. — Adest specimen alterum fructiferum vix dubie ad hanc speciem pertinens, duplo majus, racemis erectis pleiocarpis, capsulis oblongis, 6-costatis 2 lineas longis.

Obs. 2. *Appendicula tomentella* Zoll. Flor. 1847. p. 456. est *Eria tomentella* Rehb. fl. (*Eria javensis* Zoll. Mor. cf. Bonpl. 1857. p. 55.)

1491/2. **CRYPTOGLOTTIS** Bl.

Bijdr. 206. Tab. 42.

1. CRYPTOGLOTTIS SERPYLLIFOLIA Bl. l. c. Huc: *Hexameria* R. Br. Horsf. Pl. Jav. Rar. p. 26:

Perianthium erectiusculum, sepala lateralia exteriorum basi connatis et infra productis in saccum maximum calcar obtusum æmulantem. Labellum e basi calcaris ortum, unguiculatum, lamina suprema indivisa, bisecta. Columna brevissima. Anthera filamentis insidens, stigmati bilobo parallela, bilinearis. Massae pollinis cereae in singulo oculo tres (!) quarum 2 inf. collaterales, tertia superior, omnes apice acuto affixae

corpusculo septiformi loculi longitudinaliter bipartienti et cum eodem deciduae.

Epiphyta nana; caule ramoso; foliis distichis mucronatis, basi in petiolum brevem semivaginantem attenuatis, racemis terminalibus paucifloris.

Obs. Hexameria proxima Cryptoglotti esse videtur, forsitanque ab ipsa Crypt. serpyllifolia Bl. haud diversa; et si in hac necnon in Appendiculis omnibus septa mobilia decidua loculos antherarum bipartientia et massas pollinis affigentia exstant haec tria genera conjungi merentur. Numerus ternarius enim massarum, quamvis characteres insignes, et in Hexameria disticha constantes praebens, minoris certe valoris considerari debet.

R. Br.

Hexameria disticha R. Br. l. c. :

Herba parvula, inter muscos parasitica, rhizomate gracili filiformi repens. Caules hic illiac et rhizomate orti, erectiusculi, filiformes, tenues, 3—6 pollicares, ramosi, a basi ad apicem usque foliorum vaginis tecti. Folia numerosa, disticha, equitantia, patentia, 2—3 lineas longa, oblique lanceolata, mucronata, glabra, nervosostriata, basi cum vagina articulata, demum soluta et caduca. Spicae terminales, pauciflorae, floribus 3—4. Flores parvi, pedicellis patulis suffulti, singuli, bractea parva membranacea ovata, deflexa, pedicellum subtendente instructa. Perianthii foliola 6, biseriata, externa subaequalia, basi connata, late ovata, obtusiuscula, nervo medio subcarinata; anticum (ovario recte persistente directionem suam primitivam servante) paulo angustius; lateralia basi superiore connata in saccum maximum obtusum, subdidymum floris lumbum explicatum, plusquam duplo superantem et calcar emulantem, interiora lateralia exterioribus paulo breviora, oblongo-linearia, obtusiuscula; posticum (labellum) inclusum, e fundo calcaris ortum, unguiculatum, lamina anguste obovata, trinervi, integerrimamque lineam bis superante, basi utrinque in setam gracilem, unguis longitudine, abeunte. Columna brevis stigmatis lobis lateralibus auriculas breves subrotundas (in sicco) emulantibus; antice profunde bifida, laciniis lanceolatis acutis. Anthera stigmati parallela, filamento brevi filiformi affixa, ovata, apice emarginata, basi cordata, bilocularis, limbis approximatis. Massae pollinis 3, in quovis loculo ceraceae, lanceolatae, septo membranaceo, lanceolato, longitudinaliter bipartienti, demum soluto et cum massis deciduo apicibus acutis affixae; duo inferiora collateralia ad utrumque septi latus; tertia superior, paulo minor et gracilior, ad ejus latus externum. Massae superiores respondentis ad septi latus internum vestigia nulla. Caulicula nulla.

Dr. Horsfield „found this little plant in the year 1817 on the declivity of one of the principal volcanos of the western parts of Java, the mountain Gede, sit about 40 miles south of Batavia, in the rich vegetable mould, covering the rocks. It appears to be peculiar to the western portion of the island.“

Obs. Eadem Hexameria disticha affertur a Schauero l. c. Leop. XXIX. Suppl. p. 431.: „in insula Lucon prope Manilam urbem elegantissimam hanc plantulam Octobri legit G. Meyen“.

1492. **OECEOCLADES** Lindl.

Bot. Reg. 1522.

1. **OECEOCLADES TENERA** L. O. 236. Wight Ic. V. (1851.) 1683;

Caulescent, leaves oblong, fleshy, emarginate, spikes 3—4 flowered, horizontal, shorter than the leaves; posterior sepal erect, helmet-form; anterior ones leaning on the lip, equal, petals parallel to the helmet and like it all distinct at the base; lip shorter than the sepals, three-lobed, cucullate, lateral lobes erect, emarginate, truncate, middle one fleshy, threelobed, flat with 2 callosities at the bases, spur short incurved.

Flowers brownish yellow with crimson points, lip white. Nuera Ellia. Ceylon.

Mrs. Col. Walker: „ sepals and petals greenish yellow streaked with brownish red. — Lip fleshy, 3 outer lobes pure white, the other part yellow streaked with pink. Column and anthers red and yellow.“ Leaves thick and fleshy, on some plants larger and on others smaller than here represented.

Huc: *Oeonina? alata* A. Rich. *Annal. sc. nat.* 1841. p. 67:

O. caule tereti folioso, foliis alternis, basi vaginantibus, ellipticis, apice obtusis aut subbilobis, coriaceis, rarius subacutis; floribus 3 — 4, subsessilibus, rhachi communi parvula, persistente, alari suffultis; labello trilobo, lobo medio productiore trilobato; lobo medio acuto, linea longitudinali prominula notato; calcare brevissimo, recurvo, appendice membranaceo, subbilobo, ad os calcaris; fructu subtriquetro, angulis alatis.

Parasitica super arbores in convallibus sylvaticis non procul a Neddubetta Nilgherries: Perrottet. Poll. non vidi.

1493. **AERIDES** Lour.

Coch. 525.

I. Folia plana.

1. AERIDES MULTIFLORUM Roxb. Fl. Ind. III. 475. (fid. Lindl. Sert.).

A. affine Wall. in L. O. 239. Lindl. Sert. 15. 1838.

A. roseum Lodd. in Lindl. *Pact. Fl. G. II.* p. 109. tab. 60:

Foliis coriaceis canaliculatis distichis apice obtusis bilobis, spicis densis recurvis, sepalis petalisque longioribus angustatis acutis, labello rhomboideo acuminato, integerrimo, calcare brevi conico incurvo, ovario trialato labelli longitudine. *A. affine* Hook B. M. 4049. not Wall.

Aerides affine has truncated leaves, the ends of which are ever jagged, of which in *A. roseum* there is no sign. Sepals and petals remarkably blunt almost rounded. Lip more or less toothletted not unfrequently threelobed, partially imitating the bluntness of sepals. Ovary shorter than the lip, not half its length, spikes stiff and erect. — Lem. *Jard. Fl.* tab. 200. (sub *A. roseo* Lodd.)

Huc: *Aerides trigonum* Klotzsch Berl. *Allg. Gartenztg.* 1855. p. 177.

2. AERIDES CRISPUM L. O. 239; B. Reg. XXVIII. (1842.) 55:

Foliis planis apice obliquis bilobis racemis multifloris nutantibus duplo brevioribus, sepalis petalisque subaequalibus obtusis, labelli maximi lacinia intermedia multo majore ovata serrulata retusa basi bidentata lateralibus erectis acutis nanis, calcare cornuto incurvo. — Courtallum — *A. Brookei* Bat. in Bot. Reg. XXVII. (1841). Misc. 116. — Bot. Mag. 4427.

Huc: *Saccolabium speciosum* Wight Ic. V. (1851.) 1674. 1675.

Leaves strapshaped, obliquely emarginate at the apex; panicle large, lateral branches fewflowered, terminal one long, drooping at the apex, manyflowered, sepals broad ovate elliptic, obtuse, petals rhomboid spatulate, lip threelobed, lateral ones small suborbicular, furnished with a recurved plate, middle one subtriangular, crenate, reflexed on the margins, truncate at the apex, spur tapering, shorter than the lip hooked outwards, fruit short, obconical, surmounted by perianthium.

Flowers rose coloured, fading off towards the margin, lip much deeper, approaching crimson. Paulgheat in Malabar. July. Aug.

3. *AERIDES LINDLEYANUM* Wight Ic. V. (1851.) 1677:

Leaves fleshy, coriaceous, subelliptic oblong, oblique, deeply emarginate at the apex; racemes erect, many flowered, sepals and petals obovate suborbicular, anterior sepals larger and like the lip thick and coriaceous; lip three-lobed, attached to the point of the prolonged base of the column, lateral lobes small, ovate, middle one large ovate, ventricose above, crisp on the margins with a large fleshy lobe at the base, closing the spur; spur short, rigid, inflexed under the lamina; capsule large, obovate, long pedicelled. Flowers purplish lilac, deeper on the axis, fading off to a nearly white in the margins; lip the same, but much deeper. — Kartairy Falls below Kaitie; also on rocky clepts on a high hill over Conoor.

4. *AERIDES MACULOSUM* Lindl. B. Reg. XXXI. (1845.) 58:

Foliis coriaceis planis apice obliquis obtusis, racemis densis nutantibus subpaniculatis, sepalis subrotundo-oblongis, petalis conformibus duplo latioribus, labello ovato subundulato integerrimo basi utrinque unidentato tuberculo indiviso interjecto, columna brevissima.

More like *A. Brookei*, than any plant, but flowers distinctly panicled, not shortly racemose; then they are smaller; moreover, their column is short and the lip neither crisp, nor toothed, nor saddlebacked, but quite entire and nearly flat, little lobes at the base of the lip are also different; in *Brookei* they stand at right angles with the column, here they are very small, and direct themselves towards the point of the lip. — Labellum rose. Colour of this much less vivid; it has more the tint of affine, has very little white and both sepals and petals are spotted all over with light purple. — *A. maculosum* var. *Schroederi* Henfr. Gardn. Mag. Bot. 392. Lem. Jard. Fl. 54. Pesticat. t. 36.

5. *AERIDES FALCATUM* Lindl. Paxt. Fl. G. II. 142:

Foliis coriaceis distichis obtusis apice obliquis mucronatis, racemis densis pendulis, multifloris, labelli tripartiti laciniis lateralibus falcatis obtusis, intermedia obovata fissa ciliata convexa basi bicristata multo angustioribus et brevioribus, calcare brevi cum labello parallelo.

East India. Habit of *A. crispum*; sepals and petals are white with a crimson speck at the point; lip is crimson in the middle, white barred with rose at the edge and on the lateral lobes.

Obs. *A. Larpentae* Hort. fid. Rehb. fil.

6. *AERIDES TESTACEUM* L. O. 238. Huc: *Vanda parviflora* Lindl. B. Reg. XXX. (1844.) Misc. 57:

Racemo simplici, sepalis oblongis, petalis linearibus spatulatis, labelli trilobi lobis lateralibus ascendentibus acutis, intermedio oblongo canaliculato spongioso bilamellato apice circulari denticulato, calcare angusto obtuso.

Bombay. The flowers are small, pale ochre-coloured, with a lip sprinkled all over with extremely fine purple points; the middle lobe of the lip is rather spongy, has 2 broad ridges, between which runs a channel, and at the point it is almost exactly circular, with a few small toothings. 4 pollenmasses adhere to a narrow strap connected with a broad gland; but the rostellum is not in any degree extended into a beak. Habit, as I am informed, of *Vanda lamellata*.

Aerides Wightianum Lindl. Wight Ic. V. (1851) 1669 (in tabula sub *Vanda parviflora*): leaves strapshaped, oblique at the apex, obtuse, 2-lobed, with a tooth between, racemes straight, simple, manyflowered, longer than the leaves; sep. and petals oval, the anterior ones larger; lip funnelshaped, lateral lobes adnate to the foot of the column, the middle one subcuneate, roundish, trilobed at the apex; disk crested with several elevated crisp lines; spur short, conical. Middle lobe of lip deep lilac, capsule club-shaped sixangled; flowers yellow. Yamally Hills, Coimbatore. Aug. Sept.

Aerides testaceum L. O. 238. Paxt. Fl. G. II. 142:

Foliis loratis acutis bilobis, inter lobos cuspidatis, racemis strictis simplicibus multifloris, foliis longioribus, sepalis petalisque obovato oblongis obtusis, labelli infundibularis laciniis erectis, obtusis, intermedia lineari patente apice dilatata reniformi biloba dentata lineis 2 elevatis callosis in disco, calcare conico incurvo.

Ceylon on trees. Peduncles spotted. Flowers the size of *A. Wightianum*, pale yellow, with a violet spot in the middle of the lip. Capsule clavate, sixangled.

Aerides Wightianum Lindl. Paxt. Fl. G. II. p. 143:

Foliis loratis apice obliquis obtusis bilobis inter lobos cuspidatis, racemis strictis simplicibus multifloris, foliis longioribus, sepalis petalisque ovalibus anticis majoribus, labelli infundibularis laciniis lateralibus pedi columnae adnatis obtusis intermedia subcuneata apice biloba rotundata, disco lineis pluribus elevatis crispis cristato, calcare brevi conico.

Iyamally Hills, Coimbatore. Leaves strapshaped, oblique at the base, obtuse, twolobed, with a tooth between. Racemes straight, simple, manyflowered, longer than the leaves. Sepals and petals oval, the anterior one larger. Lip funnelshaped, lateral lobes adnate to the foot of the column, the middle one subcuneate, roundish, trilobed at the apex; disk crested, with several elevated crisp lines. Spur short, conical. Middle lobe of the lip deep lilac. Flowers yellow.

7. *AERIDES ODORATUM* Lour. Cochin. 525. Lindl. Paxt. Fl. G. II. 143:

Foliis flaccidis apice obtusis obliquis, racemis pendulis multifloris foliis longioribus, labelli cucullati infundibularis laciniis lateralibus erectis cuneatis rotundatis, intermedia ovata acuta inflexa, calcare conico incurvo.

Common in hottest part of India; also in China and Cochin. — Flowers white, pink at the point, fleshy, very sweetscented. — B. R. 1485. — B. Mag 4139. — Floral Cab. II. 75.

8. *AERIDES VIRENS* Lindl. Bot. Reg. XXIX. (1843.) Misc. 48 et XXX. (1844.) Tab. 41:

Foliis latis oblique retusis, racemosis pendulis multifloris, sepalis petalisque obovatis obtusis, labelli cornu acuminato ascendenti, lobis lateralibus apice denticulatis, intermedio lanceolato, medio canaliculato versus apicem denticulato.

Java. Flowers sweetscented as large as those of *A. odoratum*, white, stained and spotted with deep lilac. Its leaves are remarkable for their bright green colour.

Lindl. Paxt. Fl. G. II. 143: according to Blume his *A. suaveolens* is this species, but its small rosecoloured flowers are not such as we see in this country.

9. *AERIDES SUAVISSIMUM* Lindl. Journ. H. Soc. IV. 264. et Lindl. Paxt. Fl. G. II. 141: Tab. 66:

Racemo oblongo horizontali multifloro, bracteis nanis ovatis scariosis, sepalis petalisque ovalibus obtusis patentissimis, labello cornuto ascendente columnae adpresso trilobo, laciniis lateralibus oblongis subdenticulatis, intermedia lineari bifida sublongiore. — Lem. l. c. t. 217.

Huc: *Aerides flavidum* Lindl. Paxt. Fl. G. II. p. 101. N. 372:

(*A. quinquevulneri* facie) labelli cornuti laciniis lateralibus rotundatis integerrimis, intermedia brevior bifida glabra.

Flowers glutinous, very fragrant. Lip quite different from that of any species, with which we are acquainted, lateral lobes rounded and entire, while the middle lobe is much shorter and twolobed. Of the lip the horn is green; lobes pale yellow; sepals and petals dashed with pink.

10. AERIDES QUINQUEVULNERUM Lindl. Serit. 30:

Foliis ligulatis apice rotundatis oblique emarginatis, apiculo interjecto, racemis pendulis multifloris foliis longioribus, labelli cucullati infundibularis laciniis lateralibus erectis intermedia oblonga inflexa denticulata, calcare conico incurvo.

Cuming misit ex Philippinis.

Nearly allied to *A. odoratum*, but it wants the delicious fragrance, and yet it has a pleasant aromatic odour. Flowers have 5 purple blotches and the middle lobe of the lip is serrated; in all which circumstances the two spec. disagree.

Stem, leaves, mode of growth of *Aërides odoratum*. Sepals and petals fleshy, firm, roundish, white, with a few purple speckles near the base and a rich crimson stain at the apex, the lateral sepals much larger than the upper or the petals. Lip funnel-shaped, curved inwards at the base of its spur which is conical and green; with its mouth it presses against the column, which is embraced by its 2 lateral lobes, which are white speckled with purple; middle lobe is oblong, convex, serrated, deep crimson with a white edge and pressed close the anther.

Obs. In Paxt. Fl. G. II. 143. affertur quoddam *Aërides pallidum* Lindl. Orch. 18., quod tristic mixtura ex *Sarcochilo pallido* nostro (citatur nempe *Dendrocolla pallida* Bl. Bijdr. 290. bene pro Synonymo *Aëridis pallidi* L. O. 241.) et additur ex Rumphia (cf. Walp. Ann. III. 571.) diagnosis *Aëridis pallidi* Blume, quod verissimum *Aërides*. —

Additur locus: „Timor, on trees, also Philippines, Cuming. Flowers showy, white. Lip with transverse pale coloured bars. Spur yellowish at the tip. Flowers very sweet, like lily of the valley. Rchb. fl.

11. AERIDES DIFFORME Wall. in L. O. 242. Serit. frontisp. 7. (Descriptionem omitimus, quae eadem ac illa l. c.)

Obs. *Aërides tessellatum* Wight in L. O. 240. Doubtful plant. Specimens of Wallich: loose flowers of *Vanda Roxburghii* and leaves of some plant unknown. — „*Aërides appendiculatum* Wall. Aeranthus Lindl B. Reg. 817. — *Mystacidium* Lindl. Comp. B. Mag. Fasc. 19. p. 206. — *Angraecum* Lindl. ex part. — *Oeonia* Lindl. ex part.

§. 1. Planifolia.

1. AERANTHUS FRAGRANS. Huc: *Angraecum fragrans* Thouars Af. t. 54. Gard. Chronicle 1850. p. 599:

The leaves of Faham, known also by the name of Fahon or Fahum leaves, are imported from Mauritius. They are obtained by Angr. f. It is much sought after by the

Asiatics on account of its fragrance. It is sufficient to touch the fresh leaves for the fingers to remain impregnated with their aroma. The dry leaves, which occur in commerce have a: odour of Vanille. Alcohol and aether separate the aromatic principle, boiling water removes a slightly bitter principle and a mucilaginous substance besides in the aroma. In the country whence they are derived and come in France a very agreeable tee is prepared from them, which is used as a digestive and even recommended in disease of respiration organs. Mixed with ordinary tee they impart to it an extremely agreeable perfume.

2. **AERANTHUS GLADIFOLIUS.** Huc: *Angraecum gladiifolium* Thouars O. Afr. t. 53. Lindl. B. Reg. XXVI. (1840.) 68:

Caulescens, foliis distantibus lanceolatis acutis, pedunculis axillariibus unifloris, floris patuli phyllis omnibus ovato-lanceolatis acutis, calcare gracili pendulo, pedunculo subaequali.

Perigonium candidum. Bourbon and Madagascar and Mauritius, where it seems to have been first met with by Comerson. It was afterwards collected by Du Petit Thouars and others. Flowering in February.

3. **AERANTHUS VOLUCRIS.** Huc: *Epidendrum volucre* Thouars l. c. 81. *Oconia Auberti* Lindl. B. Reg. 817.

4. **AERANTHUS MACROSTACHYUS.** Huc: *Epidendrum macrostachys* Thouars l. c. 83.

5. **AERANTHUS FILICORNIS.** Huc: *Mystacidium* Lindl. Comp. B. Mag. fasc. 49. p. 206:

Perianthium patens, aequale, petaloideum. Labellum calcaratum, cum columna articulatum, limbo indiviso. Columna brevis recta, carnosa, semiteres, apice utrinque processu longo lineari instructa. Rostellum ovatum, elongatum, convexum, nudum. Anthera membranacea, bilocularis. Pollinia dorso excavata, caudicula longa bicurvi; cruribus filiformibus glandulis tot membranaceis peltatis insertis.

Epiphyta habitu Angraeci.

Mystacidium filicorne Lindl. l. c.

Limodorum longicorne Sw.

Angraecum capense L. O. 248.

Epidendrum capense L.

Vischrievier; super arbores prope Enon. Drege. Planta epiphyta, tota palmaris, brevissime caulescens. Folia disticha obtusissima, semipoll. lata, oblique emarginata. Racemus multiflorus, subsecundus, ab ima basi floridus. Sepala et petala lineari lanceolata, apice recurva. Calcar filiforme, apice infundibulare, sesquipollicem longum, arcuatum, dependens. Limbus labelli lineari lanceolatus, carinatus, basi gibbosus. Anthera apice truncata, brevis, rostellum nullo modo tegens. Appendices columnae lineares canaliculatae, diaphanae, obtusae, seriebus pluribus papillarum purpurearum transversis quasi barbatis.

With the habit of *Angraecum* this curious little plant has characters of so marked a kind as render it impossible to combine it with that genus. The curious two-legged caudicula each point of which is inserted in the middle of a transparent gland, the naked rostellum on which the legs of the caudicula are placed without any protection from the anther, and the two very curious bearded appendages that stand forward from the upper angles of the column, are all at variance with the structure of *Angraecum* and its allies. *Aeranthus*, *Oconia*, *Cryptopora* are sufficiently different.

Obs. Moneo, in copia florum callos in labelli basi nullos adesse. Hinc non est *Epidendrum capense*.

Rchb. fl.

6. **AERANTHUS PECTINATUS.** Huc: *Angraecum pectinatum* Thouars l. c. 51. etc. Hook. B. J. I. p. 48. Tab. CXVI.

7. AERANTHUS POLYSTACHYUS. Huc: *Angraecum polystachyum* Lindl. Bot. Reg. XXVI. 1840. sub 68:

Caulibus ramosis, foliis distichis ovalibus coriaceis oblique bidentatis, spicis oppositifoliis flexuosis multifloris, foliis paulo longioribus, bracteis orbiculatis ciliatis, sepalis basi et apice ciliatis, labello subrotundo cuspidato, calcare vesiciformi.

A caespitose plant, throwing out long roots from the lower part of its stem, whose branches are only 2—3" long. A spike of very minute flowers proceeds from opposite every leaf.

Peru. Matthews 1905. (Herb. Hooker.)

8. AERANTHUS MICRANTHUS. Huc: *Angraecum micranthum* Lindl. B. Reg. XXI. (1836.) 1772:

Caule brevi, foliis oblongis trinerviis apice obliquis, spicis secundis multifloris horizontalibus, congestis, foliis brevioribus, sepalis petalisque subaequalibus anguste ovatis apice patulis, labello conformi basi bilobo bidentato medio pubescente, calcare obtuso incurvo postico.

Caulis 2 pollicaris. Folia 1½ pollices longa, 1½ pollices lata, plana, crassa. Flores minuti, albi. — Sierra Leone.

9. AERANTHUS ORGANENSIS. (*Angraecum organense* Rehb. fil. Mss. in Herb. Lindl.):

Caule brevi, foliis oblongoligulatis apice oblique obtuseque bilobis, spicis distichis multifloris abbreviatis, bracteis ovatis minutis ciliolatis ovaria pedicellata subaequantibus, sepalis tepalisque ligulatis obtuse acutis, labello aequaliter tridentato, calcari incurvo apice vesicato ovario pedicellato subaequali. Organ Mountains: Miers.

10. AERANTHUS LANSBERGII. Huc: *Angraecum Lansbergii* Rehb. fil. Orchid. Lansb.

11. AERANTHUS SCHIEDEI. Huc: *Angraecum Schiedei* Rehb. fil. cf. Walp. Ann. III. 572.

12. AERANTHUS JAMAICENSIS Rehb. fil. et Wulfschl. Huc: *Angraecum jamaicense* Rehb. fil. et Wulfschl. Mss.

Caulis vaginis tessellatim rugulosus (arpophyllaceis), foliis ligulatis inaequaliter obtuseque bilobis valde crassis superne vernixiis, spicis paucifloris abbreviatis, bracteis minutis triangulosemiovatis, sepalis tepalisque ligulatis acutis, labello oblongo apiculato seu obtusangulo quadrato antice medio apiculato, calcari cylindraceo ovarium aequante, in capsula matura curvulo brevissimo.

Ab *Aerantho micrantho*, cum quo infaustissime confusus est, foliis vernixiis florumque fabrica longissime distat. — Arb. Fairfield Jamaicae. Wulfschlägel.

§. 2. Dolabrifolia.

13. AERANTHUS DISTICHUS. Huc: *Angraecum distichum* Lindl. Bot. Reg. XXI. (1837.) 1781:

Caule imbricato, foliis distichis compressis recurvis obtusis supra canaliculatis, floribus solitariis axillaribus, pedunculis foliis subaequalibus; sepalis ovatis petalisque angustioribus secundis obtusis, labello postico oblongo concavo apice tridentato, calcare tereti horizontali pedunculo brevior.

Caulis 3 — 4" longi, atrovirides. Folia densissime imbricata. Flores parvi, lactei carnosius, inodori. Labelli dentes laterales rotundati, intermedio recto acuto. — Sierra Leone. Loddiges imp.

§. 3. Aphylli.

§§. a. Grandiflori.

14. **AERANTHUS LINDENI.** Huc: *Angraecum Lindenii* Lindl. Gard. Chron. 1846. p. 135. Lindl. Orch. Lind. p. 12. N. 67. 1846:

Aphyllum, acaule, radicibus numerosissimis intricatis, sepalis petalisque lanceolatis, labelli trilobi cucullati lobo medio bilobo mucronato interjecto, lacinii longissimis caudatis divaricatis, calcare longissimo filiformi, capsula ovali laevi stipitata.

This remarkable plant is a true parasite, if we can judge from the manner in which its roots are planted upon the bark of trees, to which they seem inherent. The flower of the purest white is sometimes a foot in length, including the spur up to the point. When out of flower it is difficult to discover the plant, so much do the roots assume the colour of the bark in which they grow. Found Septbr. 1840 at St. Yago de Cuba, in the dense forests of Sagna and Nimanima.

Judice Rehb. fil. sic definiendus ob sequentem speciem:

Sepalis tepalisque triangulis obtuse acutis septemnerviis subaequalibus, labelli late trilobi latiligulati lobis lateralibus ante medium obtusangulis minutis, lobo medio a basi lata divergenti bicurvi, cruribus semifalcatis sexnerviis.

15. **AERANTHUS SALLEI:**

Sepalis tepalisque lineariligulatis acuminatis septemnerviis, labelli lati trilobi latiligulati lobis lateralibus acutangulis elongatis, lobo medio ligulato, longiusculo apice trifido, lacinia media triangula parva, laciniis lateralibus lanceo subulatis quadrinerviis.

Domingo. Sallé (Forsan huc pertinet specimen Schomburgkianum domingense herbarii Lindleyani).

16. **AERANTHUS FUNALIS.** Huc: *Angraecum funale* Lindl. „Gard. Chronicle“ fid. Hook. B. M. 4295. *Oeceoclades funale* L. O. 237. *Epidendrum funale* Sw. Pr. 126. *Limodorum funale* Sw. Occ. 1521. *Trichocentrum? funale* Lindl. B. R. XXIII. (1837.) sub 1950. Hook l. c.:

Subacaule aphyllum, radicibus copiosis elongatis crassis, cylindraceis, hic illic articulatis, pedicellis subbifloris, sepalis petalisque oblongo lanceolatis reflexis, labello trilobo, lobis lateralibus parvis erectis, intermedio maximo late obcordato bifido, calcare filiformi perianthio bis longiore.

Jamaica. Purdie. Perigonii sepala et tepala viridula. Labellum albidum luteo-marginatum.

§§. b. Parviflorus racemosus.

17. **AERANTHUS FASCIOLA.** Huc: *Angraecum fasciola* Lindl. B. Reg. XXVI. (1840.) sub 68:

Aphyllum acaule, radicibus longissimis flexuosis, spicis erectis multifloris distichis distantibus, sepalis petalisque linearibus acutis, labello membranaceo petalis adnato, apice brevi triangulari, calcare pendulo obtuso inflato laevi.

A small leafless plant with the habit of *A. tenue*, only the flowers are much larger, although very small, and distinctly distichous. It answers to the short character we possess of *Limodorum Fasciola*, a plant I have never seen; but as the latter is a native of the Society Islands it is probably distinct. Demerara. Schomburgk (herb. propr.) — Cf. etiam Hook. Lond. Journ. II. 1843. 673.

§. 4. Acifolii.

18. AERANTHUS ORNITHORRHYNCHUS. *Angraecum ornithorrhynchum* Lindl. Bot. Reg. XXVI. (1840). sub 68:

Foliis acicularibus, spicis oppositifoliis brevibus paucifloris (5—6), sepalis petalisque lineari-lanceolatis acutis, labello ovato apice triangulari subcarnoso, antherae apice elongato obtuso membranaceo, calcare terefi ascendente ovario longiore.

Resembling *A. subulatum* in habit, but quite different in its flowers. — Saint Catharina in South Brazil. Twedie (herb. Hooker).

1496. **CRYPTOPUS** Lindl.

B. Reg. 817.

CRYPTOPUS ELATUS Lindl. l. c. Hook. Bot. Journ. I. 45. Tab. CLX:

Caulis ut videtur erectus, elongatus, simplex, crassitie pennae cyguae, subuncialis hic illic fibris elongatis, rigidis, flexuosis, simplicibus instructus. Folia disticha, coriacea, brevia, 12" longa, 6" lata, basi vaginantia, apice oblique emarginata. Pedunculus saepe bipedalis, erectus, teres, apice racemoso subpaniculatus. Flores laxi, remoti, majusculi. Bractee ad basin pedicellorum nigro fuscae, membranaceae, amplectantes, obtusissimae. Sepala patentia, demum reflexa, omnia unguiculata, exteriora spatulata; obtusa, 2 int. lamina lata, triloba; lobis lateralibus lanceolatis, acutis, subrecurvis, intermedio fere obcordato, cum mucrone. Labellum superum sepalis paulo brevius, 4-lobum, apice mucronatum; lobis inferioribus minoribus falcato-recurvis, superioribus plusquam duplo majoribus, horizontaliter patentibus, lineari-oblongis rectis, apice obtusis, bifidis; segmentis valde obtusis calcare basi dilatata saccata longissime attenuatum, curvatum. Germen gracile, rectum, in petiolum vix angustiore attenuatum. Columna brevis antice utrinque superne dente ovato vel lobo dilatata. Clinandrium planum, antice tridentatum, in sinibus dentium glandula (pollinis?) magna, cupuliformis, viridis, in caudam latam dense bilobam attenuata, subtus lamellifera. Stigma quadratum depressum. Anthera subbiloba hemisphaerica, antice bifida, unilocularis, primum membrana (dein erumpente) tecta. Massae poll. 2 obovato subrotundae, nigrescentes, semibilobae.

1496/1. **DENDROPHYLAX** Rehb. fl.

Mss. in litt. ad cl. Grisebach.

Sepalum summum oblongum. Sepala lateralia oblongosemilunata, obtusa. Tepala ovata obtuse acuta. Labellum a basi brevissima cuneata trifidum, laciniae posticae obtusangulae parvae divaricatae, lacinia media ab isthmo brevi dilatata pentangulo antrorsum dilatata, antice sinuato emarginata, biloba, carina erecta obtusangula ascendens inter lacinias posticas et per isthmum; calcar cylindraceo-filiforme ovarium pedicellatum aequans. Columna brevis, reclinata, utrinque in alam rhombeam ascendentem expansa. Anthera antrorsum rostrata. Pollinia gemina, depressa, postice perforata. Caudicula papulis sericeis hispida glandula supposita.

DENDROPHYLAX HYMENANTHUS Rehb. fl. in litt. ad cl. Grisebach, qui misit sub Wright 1692. Cuba. „*Oncidium usneoides* Lindl.“ Radices adventitiae filiformes multum flexae. Folia —. Pedunculus filiformis, sursum ramulo elongato aequali furcatus, vaginis arctis paucis. Calcar et pedicellus muriculis minutissimis parvis obsiti. Flos illi *Ionopsis* paniculatae aequimagnus, imo labello excepto comparabilis. — Videtur igitur una cum *Oncidio usneoides* lectus.

1498. **ANGRECUM** *Rchb. fil.*

Angrecum P. Thouars O. Afr. ex p. — *Aërobion* Spr. Syst. III 716. ex. p. —
Angraecum L. O. 245. ex p.

1. **ANGRECUM SUPERBUM** Thouars l. c. 62. 63. 64. Huc: *Angr. eburneum* Lindl. Bot. Reg. XVIII. (1832.) 1522. Paxt. Mag. 1849. XVI. p. 90. B. Mag. 4761.
2. **ANGRECUM EBURNEUM** Thouars l. c. 65. Huc: *Angr. virens* Lindl. 1847. sub 19 Lindl. Paxt. Fl. G. p. 25. 26. xyl. Cf. Walp. Ann. I. 792. Ibi nescio quo anglico lapsu ex Seharampore venisse dicitur.
3. **ANGRECUM BRONGNIARTIANUM** Rchb. fil. *Pescatorea* I. 16:

Affine *A. superbo* Thouars (*eburneo* Lindl.): foliis lato-ligulatis, quam pedunculus brevioribus, bracteis minoribus, sepalis petalisque lanceolatis longe acuto-acuminatis, labelli carina basilari in lineam elevatam discum usque procurrenti, calcari filiformi tenui labello plus duplo longiori.

Planta speciosissima validissima. Caulis basi articulationem manus virilis crassus. Folia latiligulata, margine paulo undulata, apice obtuse acuta, latere altero obtusato, altero subito angustato inaequalia, subbipedalia, tres uncias lata. Pedunculus validus, bene ultra bipedalis, portione inferiori vaginis retusis brevissimis quinque longe distantibus vestitus, supra racemosus. Bracteae cucullatae ovatae, ovario plus duplo breviores. Ovarium cum pedicello tortum. Perigonium bene coriaceum. Sepala ac petala lanceolata bene acuto-acuminata, petala et sepala lateralia demum reflexa. Labelium utrinque semirhombicum, apice trilobum, lobis lateralibus obtuse triangularibus, lobo medio lanceo-cuspidato; carina depressa rhombea in lineam excurrentem in disco labelli. Calcar angustissime filiforme acutum, labello plus duplo longiore. Gynostemium brevissimum crassum, dimidio superiore antrorsum protensum. Androclinium immersum antice marginatum, per discum uncarinatum. Fovea transversa apice a lobis inflexis gynostemii tecta. Anthera depressa mitrata apice excisa, intus bene bicamerata. Pollinia depressa ovata, extrorsum profunde bisulca sessilia in caudicula ligulata brevi adhaerente, glandula peltata. Perigonium et gynostemium viridia, labelium album.

4. **ANGRECUM BILOBUM** Lindl. B. Reg. XXVI. (1840.) Misc. 451:

Caulis brevissimo, foliis cuneato-obovatis oblique bilobis reticulatis racemo verrucoso pendulo multifloro multo brevioribus, sepalis petalisque lanceolatis patentibus, labello conformi paulo majore, calcare filiformi emarginato brevioribus.

A lovely Orchid with long drooping racemes of snow white flowers, just tipped with pink and slightly sweetscented. It has singular, netted, obovate leaves, clove at the point, and slightly sprinkled with small tubercles. Lodd. imp. Cape Coast Castle. —

Bot. Reg. XXVII. (1841.) tab. 35:

Anthera cristata, unilocularis. Pollinia duo excavata, alba. Glandula alba Rostellum trans stigma, quod antice in sinum recedit, arcte deflexum, marginique sinus attingens superficiem stigmaticam in duabus partibus dividere videtur.

Huc: *Angraecum apiculatum* Hook. Bot. Mag. 4159:

Caulis brevi radicante, foliis distichis obovato-lanceolatis, oblique acuminatis opacis striatis racemo pendulo laevi (verrucoso) multifloro multo brevioribus, sepalis petalisque lanceolatis patentibus, labello conformi paulo latiore, calcare filiformi integro brevioribus, antherae crista eglandulosa.

I was at first disposed to consider it the same with *A. bilobum* Lindl. Bot. Reg. 1841. t. 35; but that has semipellucid, reticulated leaves, distinctly and deeply two-lobed at the extr., the rhachis of the raceme and peduncle are warty and the spur is dilated and emarginate at the apex. Anther case hemisph. indistinctly two-lobed, with a mucronate crest at the top, not granulated like that of *bilobum*

Sierra Leone.

5. *ANGRECUM CAMPYLOPECTRON* Rehb. fil. Bonpl. III. 226:

Aff. *Angr. bilobo* Lindl., racemo multifloro, sepalis tepalisque ovatis obtuse acutis, labelli lineariligulati lobis basilaribus obtusangulis erectis parvulis, calcaris cylindraceo sigmoideo obtuso, laminam labelli subduplo excedente ovario pedicellato tertia breviori, pollinario *A. bilobi*.

Von Herrn Consul Schiller eingeführt.

6. *ANGRECUM ARACHNOPUS* Rehb. fil. Bonpl. II. 93:

Aff. *A. bilobo* Lindl. duplo gracilius, omnibus perigonii phyllis senis subaequalibus linearilanceolatis acuminatis, gynostemio graciliore.

Pedunculus ultrapedalis filiformis rariflorus, subflexuosus. Sepala ac tepala lineari lanceolata, acuminata, labellum subaequale, calcar filiforme pedicellum prope bis superans; gynostemium gracile, stigma medium usque, limbus infrastigmaticus integer; anthera obtuse conica, androclonii limbus subinteger. — Goldküste

7. *ANGRECUM BICAUDATUM* Lindl. in Comp. B. Mag. Fasc. 19. p. 205:

Caulescens, foliis distichis lineari-oblongis, oblique bilobis, spicis horizontalibus, multifloris, foliis brevioribus, sepalis ovatis, obtusiusculis, petalis angustioribus labello tripartito plano, lacinis lateralibus intermedia ovatae aequalibus linearibus apice multifidis, calcare recto cylindraceo ovario triplo longiore.

In collibus calcareis Kopje, prope Zwart Kopsrivier.

Parva species, epiphyta. Caulis tripollicaris. Flores minuti; bracteis brevissimis, membranaceis, obtusissimis, amplexicaulis. Labelli lacinae laterales caudam apice pilosam simulant. Columna brevissima.

A very curious little species, with the habit of *A. palmiforme*, next which it might be arranged.

8. *ANGRECUM ARMENIACUM* Lindl. B. Reg. XXV. (1839). Misc. 109:

Caulescens, foliis distichis canaliculatis apice oblique et acute bidentatis, spicis lateralibus horizontalibus secundis, sepalis ovatis, petalis linearibus, labelli trilobi laciniis lateralibus acuminatis intermedia triangulari longioribus, calcare pendulo clavato basi compresso calyce duplo longiore.

Sierra Leone. Loddiges.

Flowers uniform apricot-colour, small, secund, closely arranged in a horizontal lateral spike. Habit is that of a *Saccolabium*. Very different from all *Angreca*, but has some affinity with *A. mystacinum*. The spur is twice as long, as the calyx, compressed at the base, and when inflated a little so as to appear clavate.

9. *ANGRECUM VESICATUM* Lindl. B. Reg. XXIX. (1843.) Misc. 9:

Acaule, foliis canaliculatis recurvis spicae pendulae aequalibus, floribus distantibus divaricatis, sepalis ovatis, petalis linearibus acutis, labello ovato acuto, calcare arcuato ovario longiori, apice inflato diaphano.

From the Ashantee country, whence it was obtained by Mr. Loddiges. It bears white, inconspicuous flowers, whose spurs look like a horn with a semitransparent bladder at the end. It seems to range next to *A. caulescens* from the Isle of France

Adduntur species haud bene cognitae haec:

10. *ANGRECUM CONCHIFERUM* Lindl. Bot. Mag. Comp. I. 205:

Pygmaeum, caulescens, foliis distichis linearibus, inaequaliter bilobis, vaginis verrucosis, pedunculis filiformibus unifloris, sepalis petalisque setaceo-accuminatis reflexis, labello semi-infundibulari repando crenulato membranaceo, calcare horizontali longissimo filiformi.

Outniqualand in sylvis. — Drege.

Caulis pollicaris sesquipollicarisque. Folia coriacea, plana, pollicaria. Bracteae ovatae, cucullatae, membranaceae. Flos magnus in tam parva specie, calcare et labello simul sumptis 2 poll. longis.

A most curious little species, of which I have seen only single flowers, the pollenmasses of which had fallen away. The sepals and petals are quite membranous, the lab. is of the same texture; and looks like one valve of a tiny delicate shell, with a long tube fastened gracefully to the hinge. If this is not the very model of a Triton's trumpet, I am sure it ought to have been.

11. *ANGRECUM SACCIFERUM* Lindl. B. Mag. Comp. I. 205:

Acaule, foliis linearilanceolatis distichis obtusis oblique emarginatis, scapis subtrifloris foliorum longitudine, bracteis subrotundo ovatis cucullatis, pedicellis filiformibus, sepalis oblongis acutis, petalis ovatis, labello cucullato ventricoso acuto, calcare brevissimo scrotiformi.

Outniqualand sup. arb. etiam inter Key et Basche. Drège. — Near the Nynna Burchell. — Belongs to the set of *A. caulescens*.

12. *ANGRECUM PUSILLUM* Lindl. B. Mag. Comp. I. c.:

Acaule foliis linearibus falcatis, striatis, acutis apice obliquis, spicis erectis laxifloris, foliis longioribus, bracteis brevibus diaphanis cucullatis, sepalis petalisque ovatis subaequalibus conniventibus, labello subrotundo-ovato acuto concavo postico, calcare recto ovario brevior.

Super arbores prope Boschrivier; Outniqualand, prope Koratra. Drège.

Species delicatula, inter muscos vegetans; facie omnino Phreatiae elegantis, sed minor.

13. *ANGRECUM CLANDESTINUM* Lindl. l. c. 206:

Caulescens, foliis crassissimis ensiformibus, recurvis, apice acutatis bilobis, lobo altero longissimo, spica horizontali dense semisubterranea, bracteis ovatis coriaceis rigidis, floribus nigro-pilosis explanatis, sepalis ovatis, petalis linearibus glabris, labello ovato cucullato nudo, calcare sigmoideo pendulo apice inflato.

Folia plana, 6 pollices longa. Spica crassa, 1½ pollices longa. Flores parvi, albi. Ovarium, sepala a dorso, calcar et labelli venter nigro pilosa. Labellum margine viride incrassatum. Anthera truncata, rostellum elongatum non tegens, caudicula linearis simplex; glandula linearis, acuta, adscendens. — West. Coast Afr. Lodd.

14. *ANGRECUM TENUE* Lindl. Bot. Reg. XXVI. (1840.) sub 68:

Aphyllum, acaule, radicibus longissimis intricatis, spicis tenuibus filiformibus erectis simplicibus, sepalis petalisque acuminate apice reflexis, labello ovato acuto, calcare erecto, oblongo, carinato.

A multitude of very long entangled roots, without leaves form the principal part of this plant, which seems wholly destitute of leaves. The spikes are clustered, and are from 2—4 inches high. The flowers are the smallest in the genus.

On trees near Para Martius. (herb. reg. monac.)

Obs. *Angrecum purpurascens* Gardn. Chronicle 1852. 390. Quid?

Obs. Lindl. l. c. Comp. Bot. Mag. 205: Angreci species nova adest in herb. (Nr. 1269) in sylvis Outniqualand super arbores a Dregeo lecta; sed deflorata. Caulis

est pedalis, foliis distichis recurvis apice inaequalibus bilobis, lobo altero falcato, altero brevissimo.

Mr. Burchell also found this, but without flowers, near Krakakamna Lake, in the district of Uitenhage. — Species duae alterae adsunt Dregeo inter Key et Basche lectae, sed floribus delapsis non determinandae.

16. *ANGRECUM APHYLLUM* Thouars l. c. 73: Hook. Lond. Journ. III. 1844. p. 482; Mauritius near St. Louis Gardner!

1498 $\frac{1}{2}$. **LISTROSTACHYS** Rehb. fil.

v. Mohl und v. Schl. B. Z. 1852. 930;

Perigonium carnosum-membranaceum, patentissimum, phylla externa oblongo-triangula, acuta, lateralia interna acuta; basi inferiori nunc obtusangula, labellum oblongum, subacutum, ostium calcaris transversum, calcari clavato, basi nunc sulcato, gynostemium in phyllum summum reflexum, semiteres, dorsum versus apice recurvum, androclinium rotundo-excavatum, aequaliter limbatum, rostellum integrum, acutum, stigmatis fovea rotunda, magna, limbus prominulus stigma basi et lateribus cingens, pes planus, ligulatus, liber antrorsum productus uno plano situs cum labello et gynostemio; anthera mitrata, rhombea, antice acuta, vestigia dissepimentorum nulla praeter lobulos duos minutos in fundo. Pollinia oblonga, integra, caudiculae 2 clavatae, apice cupulaeformi pollinia amplectantes, basi attenuata, in glandula communi rotundata insidentia. (Ad L. Jenischianam).

I. Folia plana.

1. *LISTROSTACHYS ARCUATA*. Huc: *Angraecum arcuatum* Lindl. Comp. B. Mag. Fasc. 19. p. 205:

Caulescens, foliis distichis lineari-oblongis, obtusissimis emarginatis, racemis multifloris, foliis brevioribus, bracteis subrotundo-ovatis membranaceis concavis, sepalis petalisque linearibus acuminatissimis patentissimis, labello conformi carinato revoluto, calcare arcuato tereti ovario duplo longiore.

Albany paras. super arbores; etiam in colle calcareo Kopje, paras. super radices fruticum foliis multo brevioribus, magis carnosis, apice oblique bilobis; an idem? flores desunt.

Near Grahams Town. Burchell.

Folia fere pollicem lata, apice aequaliter emarginata, in sicco striata, 6 pollices longa. Racemus ascendens, 4 poll. longus. Flores carnosus. Bractee magnae, conspicuae. Columna nana, rostello elongato, apice antherae superfecto. Pollinia 2, sphaerica, caudiculis totidem linearibus cartilagineis glandulae communi didymae cartilagineae adnatis.

The double caudicula of this plant is at variance with the true charact. of *Angraecum*, but I am too little acquainted with the Mauritius and Madagascar species to judge of its value. It is unaccompanied by any other peculiarity, and appears to agree with *Ep. polystachyum* of Thouars in that respect. The latter species is missed in Gen. and Sp. O. but should be placed next this as *Angraecum polystachyum*.

Lindl. Paxt. Fl. G. II. p. 120. Nr. 396. Xyl. 199.

2. *LISTROSTACHYS CAUDATA*. Huc: *Angraecum caudatum* Lindl. B. B. Reg. XXII. (1836.) 1844:

Folius loratis canaliculatis emarginatis, spica radicali pendula flexuosa 4-flora, labello obovato rostrato serrulato, calcare longissimo apice bilobo.

Epiph. radices crassas, simplices, nebulosas promens. Caulis simplex, brevis, foliis loratis canaliculatis apice fissis 6" longis, distiche imbricatis. Spica pedalis, ex axilla imorum foliorum pendula; pedunculo gracili, atroviridi, ad nodos tumido; rachi flexuosa, internodiis circiter 2 poll. longis. Ovarium sessile, fusco maculatum, basi tortum. Sepala et petala explanata, linearilanceolata, acuminata, herbacea, aequalia, basi fulva, fere 2" longa. Labellum ejusdem longitudinis, album, petaloideum, serrulatum, cuneatum, angulis rotundatis vel potius obovatum, apice mucrone longo viridi rostratum, ima basi involutum et denticulatum, in calcar productum 9 poll. longum, fulvum, subulatum, apice (fig. 3.) obtusum et bilobum. Columna fulvo-viridis, brevis, erecta, basi (fig. 1.) crassior et angulata, sursum attenuata et marginata, gynizo plano fulvo, rostello subulato gynizo longiore. Poll. 2, postica paulo sulcata, in caudiculum longam cuneatam sessilem.

Sierra Leone, Loddiges. — B. Mag. 4370.

3. LISTROSTACHYS PELLUCIDA. Huc: *Angraecum pellucidum* Lindl. B. Mag. XXX. 1844. 2:

Acaule, foliis distichis oblongis subundulatis recurvis apice obliquis, basi equitantibus, racemis densis nutantibus axillaribus foliis brevioribus, sepalis petalisque linearilanceolatis, labello fimbriato cordato-ovato truncato, calcare brevi lanceolato porrecto, caudiculis 2 subulatis, glandula communi didyma.

Flowers delicate and transparent as if they were flakes of snow fixed by frost in the very act of melting. Each part of the lip is studded and bordered with little crystalline elevations, and the whole fabric of the blossom is as fragile as thin plates of glass. — Sierra Leone Msr. Lodd.

4. LISTROSTACHYS MONODON. Huc: *Angraecum monodon* Lindl. Paxt. Fl. G. II p. 102. fig. xyl. 187. $\frac{6}{1}$ magn.:

Subacaule, foliis distichis oblongis oblique bilobis, racemis angustis multifloris, bracteis minimis membranaceis rotundatis cucullatis, ovatis, acutis, labello subrotundo basi dente solitario aucto calcare crasso clavato breviori.

Smells like seeds of horse-chesnut. Flowers pink. — Pescatore.

5. LISTROSTACHYS ASHANTENSIS. Huc: *Angraecum ashantense* Lindl. B. Reg. XXIX. (1843.) Misc. 75:

Caulibus repentibus, foliis distichis coriaceis ovatis apice oblique erosis, foliis subaequalibus, floribus resupinatis, tepalis petalisque galetis denticulatis ovato-lanceolatis, obtusiusculis, labello pandurato obtuso denticulato basi unidentato, calcare arcuato subcompresso basi constricto labelli longitudine, pollinis caudicula acuminata bipartita.

Light cinnamon coloured flowers in spikes 4" long.

Ashantie Loddig. flowered 15/6/43.

6. LISTROSTACHYS PERTUSA. Huc: *Angraecum pertusum* Lindl. Comp. B. Mag. Fasc. 19. p. 205:

Caulescens, foliis distichis loratis oblique bilobis, spicis recurvis secundis densifloris, sepalis ovatis obtusis patentissimis, petalis paulo minoribus, labello plano obovato reflexo apiculato infra medium calcarigero, calcare clavato labello longiore.

Fol. 4—5 poll. longa, supra leviter scrobiculata infra purpureo-punctata, valde carnosa, duas tertias pollicis lata. Flores parvi, purpurascens, dense secundi. Racem. 4—5" long. Bractea minima acuta. Labellum fauce calcaris orbiculari infra medium perforatum nec ad ipsam basin ut in reliquis. — West Coast of Africa, Lodd.

a. *Jenischiana*. Huc: *Listrostachys Jenischiana* Rehb. fl. l. c.: perigonii albi phyllis acutis, calcaris ostio transverso. *Listrostachys pertusa* Rehb. fl. l. c. — Bot. Mag. 4782:

Caule brevi, foliis distichis elongato oblongis rectiusculis carinatis utrinque pinnulatis apice oblique bifidis basi equitantibus, racemis densis nutantibus axillaribus, folia aequantibus, floribus imbricatis distichis, ovaris sepalsque rotundatis concavis tuberculatis, petalis ovalibus, labello apice rotundato obtuso, basi dilatato compresso, calcare clavato labelli longitudine.

A. pertusum Lindl. in Paxt. Mag. Nat. VII. 287.

b. *Pescatoriana* Rehb. fl. labello apice melius truncato: *Angraecum Pescatorianum* Lindl. Journ. Hort. Soc. IV. 263. (1849):

Foliis angustis canaliculatis oblique obtusis (lobo altero obsoleto), spicis brevibus densissimis cylindraceis, floribus extus nigro pilosis, labello cuneato truncato trilobo, calcare curvo clavato obtuso laminae longitudine.

Isle de France. Bouton.

Flowers small, seem to have been white, appear in short dense cylindrical spikes; the leaves are nearly a foot long, distichous like other *Angreks*, with a very oblique blunt end. The 2 pollenmasses have each caudicle and common gland.

7. *LISTROSTACHYS POLYSTACHYS*. *Epidendrum polystachys* Thouers l. c. Tab. 82. *Angraecum polystachys* Lindl. Comp. B. Mag. l. c. 205 nec *Angr. polystachyum* Lindl. B. Reg. 1840 sub 68.

II. Folia subulata.

8. *LISTROSTACHYS SUBULATA*. Huc: *Angraecum subulatum* Lindl. Comp. B. Mag. l. c. 205:

Caulescens, gracile, foliis subulatis, sepalis ovatis acutis, petalis linearibus acutis paulo brevioribus, labello postico ovato cucullato crasso intus nudo, calcare recto filiformi ovario longiore. Flores parvi, albi, solitarii. Columna brevissima. Poll. *Angraeci veri*.

West Coast of Africa. Loddiges.

1500. **AGROSTOPHYLLUM** Bl.

Bijdr. 368. Tab. 53.

1. **AGROSTOPHYLLUM HASSELTII**. Huc: „*Appendicula Hasseltii* Bl.“ Wight l. c. 1748. 3:

Stems simple, terete; leaves broadly linear, retusely mucronulate, sheaths of the leaves edentulate; limb of the lip erect, crenulate.

Mergui: Griffith.

Fig. of entire plant is somewhat reduced.

2. **AGROSTOPHYLLUM PLANICAULE**. Huc: *Agrostophyllum Khasiyanum* Griff. Calc. Journ. IV. 1844. p. 378. Tab. XIX.:

Petalis lineari lanceolatis, labelli lamina obreniformi, sinu dentigero margine integro.

Eria planicaulis Wall. (sine char.) Lindl. B. Reg. 28. Misc. not. p. 8. Nr. 4. Montes Khasiyani.

Caules aggregati, plani, basi attenuati, vaginis distichis $\frac{1}{2}$ amplectentibus semitecti. Folia 2—3, apicem versus caulis, linearilanceolata, basi attenuata, apice aequaliter bifida, mucrone interjecto. Spicae 2—3 florum in capitulum terminalem subnutantem paleaceum congestae, bracteis paleaceis vaginantibus sursum majorifactis vestitae

Flores minuti, viridiscientes albidii, in paleis subimmersi, superiores praecciores; interdum solitarii. Perianthium ringens, posticum. Sepala oblonga, acuta, lateralia obliqua et ab labelli basi saccata. Petala lanceolata, paulo breviora, margine recurva fere conduplicata, vel semireflexa, alba. Labellum horizontale saccatum cum columna continuum, medio constrictum et transverse septatum, septo lutescente, late emarginato; lamina reniformis, emarginata, dente interjecto, aucta crista obsolete longitudinali margine crenulata subrecurva. Columna sepalis paulo brevior, medium versus gibbere valido subbilobo instructo, gradatim attenuata in pedem brevem, cum quo labellum continuum. Clinandrium tridentatum. Stigmatis labium superius (rostellum) bipartitum, parvum, inferius carnosum, magnum, revolutum; tela stigmatosa tantum subtus labium superius. Anthera terminalis, 8-locellata. Pollinia 8, oblongo obovata, in glandulam rotundam rubescentem sessilia. Ovarium rectum, costis inconspicuis. — Introduced by Mr. Gibson, during his residence on the Khasiya Hills. It succeeds well in mould with broken pots. I know it to be the *Eria planicaulis* of Dr. Wallich, with the authority of a drawing in the Library. The name would have been passed over entirely, had it not made its appearance, under the sanction of Dr. Lindley; and so grave are the mistakes, that may be imposed by the authority of Mss. names, which should very generally be viewed with suspicion, that this plant which differs toto coelo from *Eria*, and which belong to the Sect. *Vandae* of Dr. L. has been characterized by that authority on the species of this difficult family as an *Eria* and has also been fully described by Mr. Booth, as an *Eria*.

1501. **CALANTHE** RBr.

Bot. Reg. 518.

Lindl. Folia I. Fasc. VI. VII. (Novbr. 1855.) (Impressa monographia Novbr. I. 1854.):

This well-marked genus approaches *Phaius* very nearly, as Griffith has pointed out, but the adhesion of the pollen-masses to a separable gland is constant, unless the flowers are examined too early. *Limatodis* differs in having a lateral inflorescence as well as a free cucullate lip. The callosities on the lip afford excellent specific marks, but cannot be employed in the generic character, as will be evident from the following enumeration.

§. 1. *Ghiesbreghtia*. A. Rich. in Ann. Sc. ser. 3, III. p. 28.

1. CALANTHE TRICARINATA Lindl. Orch. Nr. 18. L. F. p. 2.

2. CALANTHE PUBERULA Lindl. Orch. Nr. 19. Griff. ic. t. 313. L. F. p. 2:

Flowers rose-colour, with linear yellowish petals, and a purple lip. The middle lobe of the lip varies in form from linear-lanceolate and entire to obovate oblong, or lanceolate and serrate.

Wild on the mountains of Sylhet—Wallich; Khasia Mountains — Griffith, at the height of 5—6000 feet—Hooker and Thomson; N. W. Himalaya, at 5000 feet—T. Thomson; Assam—Mack; Sikkim, Dorjeeling, at 3000 feet—J. D. Hooker.

3. CALANTHE OCCIDENTALIS L. F. l. c. p. 3:

C. scapo ovarioque tomentosis, labelli basi conici lobo medio subrotundo crispo 5-lamellato.

The five lamellae planted upon a nearly orbicular lip, with a very short conical spur, plainly distinguish this. I know nothing of its colour.

Wild in the N. W. Himalaya; Sirmur, at 6—7000 feet—T. Thomson, Jacquemont.

4. CALANTHE BREVICORNU Lindl. Orch. Nr. 16. Sertum Orchid., t. 9. L. F. p. 3: •

Flowers brick-red, striped with white.

Wild in Nepal—Wallich; Kamaon—Namik, at 9000 feet—Strachey and Winterbottom; Sikkim, in woods, in May, at 5—6000 feet—J. D. Hooker.

Sert. l. c. 9: 9"—1½' broad, deep green leaves gradually taper off into a sheathing foliaceous stalk, surrounded externally by several sheathing scales. Scape about the same height as leaves, smooth, round, with a few distant scales. Flower racemes generally arranged on one side of the scape; subtained by ovate-lanceolate, slightly downy bracts, longer than the pedicels. Ovary clavate, downy. Sepals and petals linear-lanceolate, spreading, nearly equal, striped with bright light red. Labellum 3-lobed, not very not much united with the column, has a very short smooth spur; lateral lobes are acute, and much smaller, than the middle one, which is obovate and emarginate, with 2-deep vertical plates incumbering down the middle towards the spur, and concealing a third, which is smaller, but longer; its col. is white, with a few reddish spots at the base. The fruit is an oblong triangular capsule, opening at the angles into 3 valves.

5. CALANTHE BILOBA Lindl. Fol. p. 3:

C. spica densa cylindracea, sepalis acuminatis patentissimis, petalis linearibus, labelli basi conici lobis lateralibus obsolete, intermedio unguiculato cuneato bilobo lacinis acutis per axin carnosos.

Flowers in long spikes, dull wine-red. The pollen-masses are represented in a drawing among Mr. Cathcart's collection, as adhering to a wedge-shaped caudicle, as broad and nearly as long as themselves.

Wild in Sikkim, at 4000 feet—J. D. Hooker.

6. CALANTHE MEXICANA Rehb. fl. Orch. Europ., t. 355. fig. 5. 6. 7. Bot. Ztg. 1853. p. 493. L. F. p. 3:

C. spica conica, floribus omnino tomentosis, petalis nanis, labello paulo longiore obovato apiculato cornu brevi lacinis lateralibus erectis nanis.

Ghiesbreghtia calanthoides A. Rich. l. c. Lindl. in Orch. Linden, Nr. 129.

„Petals yellowish white, dotted with rose.“ — Linden. Although I adopt Mr. Reichenbach's view, and refer this new-world plant to the old-world genus *Calanthe*, it is necessary to observe, that, in its dwarf petals and lip, and in the double gland of the pollen-masses, it is sufficiently distinguishable, and more deserving of distinction than many so-called genera. Its habit is however the same as that of *Calanthe*.

Wild in Mexico—Galeotti, Leibold; in Cuba on the edges of the forests of Mount Liban and the Sierra Maestre, at the height of 3000 feet, August—Linden.

Obs. Citatum falsum. Etenim descripta est primum in de Schlechtendalii Linnaea 1844. 406:

Scapo erecto, foliis latis oblongis acuminatis brevioribus seu aequali multifloro, bracteis lanceolatis ovarii longioribus, sepalis petalisque minoribus oblongis obtusiusculis, labello ovato obtuso integerrimo puberulo calcarato, calcare tenui ovario brevioribus. — Mexico Leibold.

Ghiesbreghtia Rich. et Gal. Ann. sc. nat. 1845. Jan. p. 28:

Perianthium explanatum, sepala libera. Labellum cum gynostemio omnino connatum et quasi vaginam antice basi calcaratam efformans, indivisum subcristatum; vagina gynostemii apice antice biloba, basi calcarata, gynostemium breve, clinandrium marginatum, rostellum subelongatum, retinaculo oblongo terminatum. Anthera subglobosa. Pollinia 8 per 4 agglutinata, et cum retinaculo cohaerentia.

7. CALANTHE ABBREVIATA Lindl. Orch. Nr. 15. (*Amblyglottis* Bl.) L. F. p. 4:

Flowers white, in May.

Wild in Java, near the cataracts of the river Tjikundul in the mountains of Gede —Blume.

§. 2. *Eucalanthè.*

8. CALANTHE ALPINA J. D. Hooker, Mss. L. F. p. 4:

C. spica secunda, labello subrotundo inciso basi nudo, calcare pendulo filiformi-conico duplo longiore.

Flowers greenish yellow, „scentless“; lip yellowish, very irregularly striated with red.

Wild in Sikkim, at Lachen, in pine woods, at 10,000 feet, in July—J. D. Hooker.

9. CALANTHE CONSPICUA Lindl. F. p. 4:

C. sepalis oblongo-lanceolatis aequalibus, petalis retusis paulo latioribus, labello lobo medio obcordato basi cuneato versus columnam hispido, calcare compresso clavato incurvo labello aequali.

A noble species with the habit of *C. Masuca* and *fulgens*, but with flowers twice as large as in either; their colour is unknown. Leaf broad, like that of *C. veratrifolia*, slightly pilose beneath. Raceme short, roundish. Flowers nearly smooth, two and-a-half inches long, at least, from the setting on of the pedicel to the end of the lip. Sepals narrowly oblong, one-and-a-half inch long, acute, equal-sided, three to five-veined; petals the same length, rather broader, quite retuse. Side lobes of lip truncate recurved, middle one broadly obcordate, slightly denticulate. The surface of the base, owing to the fleshiness of the parts and the pressure into which they have been subjected, cannot be exactly ascertained. There is however no doubt that there is a line of small soft teeth, as in *C. sylvatica*, and I believe the mouth of the spur is stopped by some large warts. The spur is remarkably club-shaped and curved like a sabre.

Among Reinwardt's *Icones ineditae*, is a plant with pale lilac flowers which may belong to this species.

Wild in the Philippines; Bohol—Cuming.

10. CALANTHE CURCULIGOIDES Lindl. Orch. Nr. 13. Bot. Reg. t. 8. 1847. L. F. p. 4.

Styloglossum nervosum Kuhl and Hasselt.

? *Amblyglottis pulchra* Blume Bijdr. 371.

? *Calanthe pulchra* L. O. Nr. 9.

Spike erect, a foot long in vigorous specimens. Flowers bright yellow.

Wild in Malacca—Griffith; Penang and Singapore—Wallich; Java, in the woods of the mountains of Seribu—Blume.

Cf. Walp. Ann. I. p. 792.

11. CALANTHE ANGUSTIFOLIA Lindl. Orch. Nr. 12. (*Amblyglottis* Bl.) L. F. p. 5:

I have wild specimens from Mr. Lobb, in one of which the leaves are three times as broad as in the other. The spike is thin and few-flowered, with deciduous bracts. Two inflated sheaths clothe the scape. In Reinwardt's unpublished figures, where it is called *Limodorum striatum*, the flowers are represented as white with a pale orange-coloured lip. I find the latter to be four-lobed, with rounded equal lobes and a pair of calli at the base.

Wild in Java—Lobb; in shady places on the mountains of the province of Buitenzorg—Blume.

12. CALANTHE CLAVATA Lindl. Orch. Nr. 11. L. F. p. 5:

A fine species with primrose flowers in a dense cylindrical raceme.

Wild in Sylhet—Wallich; Khasia, at 4000 ft—Hooker and Thomson; Sikkim at 4–5000 feet—J. D. Hooker, Cathcart.

13. CALANTHE GALEATA Lindl. Fol. p. 5:

C. (racemo paucifloro secundo), sepalis petalisque galeatis, labello basi bicaltoso laciniis lateralibus linearibus brevibus intermedia obtusata calcaris acuto curvo aequali.

Dr. Hooker's herbarium contains no specimen of this very distinct species, which is founded on a sketch by himself, preserved among his collections. It represents a plant with the following peculiarities. Scape rather more than a foot high, with a pair of young leaves at the base, from among which rises a nodding raceme of four flowers; the full-grown leaf is about eighteen inches long, broadly oval tapering into a channelled petiole. The sepals and petals are dull olive striped with crimson, and „converge over the anther.“ The lip is white with a rose-coloured spur. There is nothing in the genus to which this can be referred even if the few-flowered raceme and nodding flowers, which may be accidental, are disregarded. The capsules are pyriform, triangular and about one-and-a-half inch long. The drawing is dated May 9, 1848.

Wild in Sikkim, at 4000 feet, near Dorjeeling—J. D. Hooker.

14. CALANTHE EMARGINATA Lindl. Orch. Nr. 4. (*Amblyglottis* Bl.) L. F. p. 5:

Flowers large, violet, with orange-coloured callosities on the lip.

Wild in Java, in the prinnaeval woods of M. Gede—Blume.

Obs. Omisit cl. Lindley: Wight Ic. pl. Ind. or. III. 918. (1844), cf. tamen sub 16.

15. CALANTHE SYLVATICA Lindl. Orch. 6. L. F. p. 5.

Centrosia sylvatica Thouars Orch. afr., t. 35. 36.

B. natalensis Rehb. fil. in Linnaea XIX. 374.

Flowers white, gradually changing to bright yellow without fading, so that the upper part of the long spike is pure white, the lowest very yellow, the middle a delicate cream colour. Within the hollow of the column lower down than the tubercles, I find a pair of fleshy calli.

Wild in Mauritius and Bourbon—Thouars, Bouton &c.; fields in elevated situations—Bojer; La Ponce—Gardner; B. Port Natal—Rehb. fil.

The Natal plant which Mr. Reichenbach regards as a variety, I have seen nowhere. It would seem to have a more slender habit, shorter bracts, and a finer spur. — Cf. Paxt. Fl. G. I. p. 25. Nr. 33.

Obs. *Calanthe versicolor* b. *natalensis* Rehb. fil. ame serius pro specie, *Calanthe natalensi*, edita. Cf. Bonpl. IV. p. 322. Rehb. fil.

Huc ad *C. sylvaticam* Lindl.: *C. versicolor* Lindl. Sert. Orch. 42. Bot. Reg. 1844. sub 37

Wild in the East Indies, locality unknown. Flowers white, with a purple lip, changing to yellow.

Lindl. Sert. l. c.: Habit of *C. veratrifolia*. Leaves very broad, rather concave, when in great vigour, and as much as a foot and a half long, among them rise the stout noble scapes, round, here and there furnished with a sheathing scale, smooth near the ground, but downy over all the upper portion. Flowers quite smooth, of a deep rich violet, very acute, spreading, and rather larger than the petals, which have the same form, but are a little curved back at the tips. The lip adheres by the base to the whole edge of the column, which is unusually short, it is three-lobed, the side lobes are half foveate, obtuse, and much smaller than the middle lobe, which is obovate, almost wedgeshaped, deeply split, along its middle runs a line of warts, which terminate next the column in 3 much larger oblong tubercles. Spur is curved, little thickened towards the end, about the same length as the downy ovary. — Fl. at Sion. Sept. 1840.

Lindl. Bot. Reg. l. c.:

Foliis oblongo-lanceolatis erectis concavis 7—9 nerviis, utrinque glaberrimis scapo apice pubescente brevioribus, racemo denso pyramidato, labelli columnae brevi accreti trilobi lobis lateralibus ovatis nanis, intermedio cuneato bilobo multo majore, basi bituberculato secus lineam mediam verrucoso, calcare glabro ovarii pubescentis longitudine.

16. CALANTHE MASUCA Lindl. Orch. Nr. 3. B. R. 1844, t. 37. B. M. t. 4541. L. F. p. 6: *C. emarginata* Wight. Ic. 3. t. 918.

Flowers large, purple, with three long rugged white or orange-coloured callosities on the base of the lip. The Ceylon and Java localities indicated in L. O. must now be expunged, as uncertain.

Wild in Nepal—Wallich; Sikkim—Cathcart; Nilgherries—Lobb.

Bot. Reg. XXVIII. 1842, Misc. 52, et 1844. t. 37:

Scapo erecto, foliis latis oblongis petiolatis acuminatis longiore, racemis multifloris, labello tripartito basi tuberculis seriatis 5-cristato, seriebus intermediis elevationibus; laciniis lateralibus linearibus subfalcatis, intermedia cuneata emarginata in unguem linearem laciniis lateralibus aequalem angustato, calcare longissimo falcato clavato, columna brevi obliqua antice bifoveata, ovario pubescente.

Deep violet flowers with a rich purple lip. Nepal, Bengal, Ceylon, probably Java. — Cf. Paxt. Fl. G. I. p. 138. Nr. 187. Lem. Jard. Fl. t. 62.

17. CALANTHE PURPUREA Lindl. Orch. Nr. 2 B. Reg. 1844. sub t. 37. L. F. p. 6:

The three preceding species are very difficult to distinguish, and possibly *C. versicolor*, the wild locality of which is unknown, may be a mere variety of *C. Masuca*. What differences I most rely upon will appear from the following contrast:

	<i>versicolor.</i>	<i>Masuca.</i>	<i>purpurea.</i>
Leaves	smooth on both sides	pilose beneath	softly hairy beneath
Raceme	close	open	close.
Bracts	leafy, larger than the ovary	shorter than the pedicels	as long as pedicels.
Sepals and Petals	white	purple	purple.
Lip	broad	broad	narrow.
Do. sidelobes . .	oblique	broad	round.
Spur	nearly straight, not longer than the pedicel	curved, longer; than the pedicel	nearly straight, shorter than the pedicel.

I should add that for the characters of *C. purpurea* I am obliged to rely chiefly upon an Indian drawing, all the Ceylon specimens that I have seen being much decayed and hardly examinable, except a small uncharacteristic one in Sir W. Hooker's Herbarium, collected by Mrs. Walker.

Wild in Ceylon—Macrae, Walker.

Lindl. Bot. Reg. XXX. 1844. sub 37;

Scape erecto foliis lato oblongis petiolatis acuminatis supra pilosis subtus tomentosus longiore, racemis laxis multifloris, labelli trilobi lobis lateralibus nanis rotundatis patentibus intermedio angusto cuneato divergenti-bilobo, calcare ovario vix brevior.

18. *CALANTHE UNCATA* Lindl. Fol. p. 6:

C. racemo angusto, bracteis foliaceis ovario multo longioribus, labelli basi hispidi lobis lateralibus dimidiatis acutis intermedio bilobo, calcare uncinato.

Flowers small, the lowest scarcely longer than the bracts. Spur remarkably hooked upwards. I have seen only a single specimen, sent me by Griffith.

Wild in Sikkim; Dorjeeing—Griffith.

19. *CALANTHE PARVIFLORA* Lindl. in Paxt. Fl. Gard, sub t. 61. L. F. p. 7:

A slender species, with a downy spike, sometimes as much as a foot long. Leaves from two and a half to four and a half inches broad. Bracts much reflexed. The lateral lobes of the lip are conspicuously larger than the deeply bifid middle one; the warts are very numerous and extend from the sinus to the base in crowded rows. The pollen-masses are almost sessile on an obovate gland.

Wild in Java—Lobb. 334.

Lindl. Paxt, Fl. G. 2;

Scape gracili multifloro pubescente bracteis reflexis, labelli lobis lateralibus ovatis intermedio bilobo obtuso divaricato usque ad basin verrucoso, calcare glabro fusiformi pendulo sepalorum longitudine.

Java. Lobb. 334.

20. *CALANTHE ANGUSTA* Lindl. Fol. p. 7:

C. racemo tomentoso denso angusto, labelli lobis lateralibus intermedio bipartito minoribus, verrucis paucis gyratis, calcare subclavato apice inflexo ovario paulo longiore.

Leaves very small, not more than four inches long, petiole included. Scape a foot high and more, with a few distant ovate sheaths. Raceme very dense and narrow, with short downy ovate bracts, resembling that of *C. veratrifolia* on a small scale. The warts at the base of the lip form a kind of circle with two or three smaller in the middle, and one or two outside in the direction of the point.

Wild in Khasia—Lobb.

21. *CALANTHE FURCATA* Batem. in B. Reg. 1838. Misc. 34. L. F. p. 7:

A plant with the habit of *C. veratrifolia*. Flowers white. Mr. Reichenbach has rightly pointed out the fact that the spur of this species is variable, sometimes being emarginate, sometimes not, and either longer or shorter than the lip. The same fact is observable in my wild specimens. It chiefly differs from *C. veratrifolia* in the larger size of the lateral lobes of the lip. It is probably the *Amblyglottis veratrifolia* of Blume.

Wild in the Philippines—Cuming; Java—Junghuns (308), De Vriese.

Calanthe furcata Batem. Msser. in B. Reg. l. c.

Foliis ovato-lanceolatis profunde plicatis scapo dense capitato subaequalibus, labello columna omnino adnato tripartito basi glanduloso-

cristato laciniis lateralibus semiovatis apice rotundatis, intermedio cuneato divaricatim bilobo lobis apice serratis, calcare incurvo pubescente apice furcato labello brevior.

A whiteflowered species, with a scape about a foot high, received by Mr. Bate-man from the Luzon islands, where it was collected by Mr. Cuming.

Rehb. fil. in v. Schl. B. Ztg. 1852. 736:

Sowohl Exemplare von Cuming gesammelt, als solche, welche in Tetschen blühten sind dimorphisch. Entweder hat der Sporn zwei kleine priemliche Spitzen, oder die Spitze ist ganz flach gedrückt, zweispaltig. Hr. Bateman giebt an: „calcare incurvo pubescente apice furcato labello breviori.“ Unsere Pflanzen zeigen den Sporn länger als die Lippe, die Säulenpartie eingerechnet.

22. CALANTHE VAGINATA Lindl. Fol. p. 7:

C scapo vaginis dense imbricato, racemo denso conico tomentoso, bracteis floribus longioribus, labelli 4-lobi laciniis aequalatis obtusis crista verrucosa antrorsum hispida, calcare labello longiore.

I have only seen a solitary scape, remarkable for the very numerous loose leafy scales with which it is invested. The inflorescence is unusually dense. No leaves accompany the specimen. Possibly the flowers may appear before them, as Griffith says is the case with his *C. odora* (See Nr. 38).

Wild in Assam—Major Jenkins.

23. CALANTHE PEROTETTI A. Rich. in Ann. Sc. Ser. 2, XV. 68. Wight ic. pl. t. 1664. L. F. p. 7:

Flowers delicate lilac, according to Wight, the lip with a deeper tinge. They are twice as large as in *C. veratrifolia*, and appear to have in all cases the sepals and petals erect, and presenting a somewhat campanulate appearance, whereas in that species the lateral sepals are completely reflexed. Differs from *C. purpurea* and its allies in the lateral lobes of the lip being as long as the middle one or nearly so.

Wild in the Nilgherries—Lobb; frequent in clumps of forest, in moist soil, from July to August, or even as early as May—Wight.

Calanthe Perrottetii A. Rich. Ann. Sc. Nat. XV. 1841. p. 68:

Folius petiolatis, ellipticis, nervosis, plicatis, acutis, pedalis aut sesquipedalibus, scapo distanter vaginato, foliis aequali aut sublongiori; spica laxiuscula; floribus lilacinis, longe pedunculatis, bracteatis; bracteis ovali-lanceolatis, pedunculi ovariique longitudine; labello trilobo, subplicato, sepalis sublongiori; lobis lateralibus angustis, erectis, subfal-catis, medio obcordato, alte bilobo, calcare gracili, labello fere duplo longiori; ovario pubescente.

Sylv. humid. circa Avalanchy. Nilgherries.

Wight Ic. V. 1664. 1665: Leaves petioled, elliptic, curved, plicate, acute, scape longer than the leaves, furnished with distant sheathing scales: raceme loose: bracts ovate, lanceolate, length of ovary: sepals and petals subequal, ovate, obtuse: lip three-lobed, lateral lobes lanceolate, middle one much larger, truncately 2-3-lobed, lobes spreading; spur slender, straight, longer or about the length of the lip. Flowers light lilac, lip with a deeper tinge. — Nilgherries, frequent in clumps of forest, in moist soil, flowering July and August. I have seen it in flower in woods about Coonoor in May. Too near *C. veratrifolia* Lindl.?

24. CALANTHE VERATRIFOLIA R. Br. in B. Reg., t. 720. L. O. Nr. 1. Griffith Ic. t. 283. fig. 4. L. F. p. 8:

(A.) Flowers pure white.

(B) *discolor*. A dwarf form with a dirty brownish lip, and a pale purple central stain.

(C.) *australis*. Flowers white changing to buff.

Amblyglottis flava Blume Bijdr. 370. t. 64.

Flos triplicatus Rumph. Amboyn. VI. t. 52. fig. 2.

(D.) *comosa*. Raceme very dense; bracts broad, very downy.

C. comosa Rehb. fil. in Linn. XIX. 374.

This is a very extensively dispersed plant, varying somewhat in appearance according to soil, place and climate. The varieties above enumerated might without inconvenience be disregarded, or they might be greatly multiplied. The size of the bracts, the denseness of the inflorescence, and the degree of downiness are very variable circumstances.

Wild in many tropical parts of Asia; A. Ceylon, up to 6000 feet—Mrs. Walker; Continent of India; B. Ceylon—Macrae; C. Australia, in the Illawarra district, South of Port Jackson—A. Cunningham; Amboyna—Rumphius; Java—Blume; D. Ceylon—J. D. Hooker; Nilgherries—Rehb. fil.

Bot. Reg. XXV. 1839. Misc. 39: In Aug. 1822, whilst on excursion to the Illawarra, a coast district on the south of Port Jackson, I met with a plant in dark shaded woods, which J introduced to Kew, in the foll. year considering it a *Bletia*. It soon afterwards flowered in that coll. and was then ascertained to differ in no one respect from the Java plant. They have repeatedly been in flower together since that period, and on a close critical examination of the two plants, no difference could be discovered, excepting that the Australian plant is not so purely white in the flower, as the Java one; their identity is therefore clearly determined. Illawarra district, near Port Jackson (lat. 34½ S.) is therefore another locality. — New South Wales All. Cungh.

Lindl. Paxt. Fl. G. II. 132. *Calanthe veratrifolia* var. *australis* (*Calanthe australi* Hort.). Not purely white. Ex Moore: „spur is shorter, flowers more compact. Leaves also shorter and the plant is hardier, having stood in a cool greenhouse all the season and flowered nicely.“

25. CALANTHE GRACILLIMA Lindl. Fol. p. 8:

C. racemo gracillimo pubescente, bracteis ovatis acutissimis, sepalis lateralibus subrotundis reflexis petalis angustioribus, labelli 5-lobi laciniis linearibus obtusis, verrucis paucis sub cucullo plicato latentibus, calcare recto labello longiore.

C. veratrifolia Hooker in Bechey's Voyage p. 71:

A very slender plant with a narrow raceme sometimes as much as eighteen inches long, with straight sharp narrow by no means undulated bracts and very little down. The flowers are much like those of *C. veratrifolia*, but the lateral sepals are roundish, equal-sided and five veined, while the petals are narrower and three-veined; and the crest at the base of the lip consists of a fleshy hood beneath which lurk a few warts, terminating forwards in a narrow elevated plate. By this circumstance it is abundantly distinguished from *C. veratrifolia*, independent of its different habit. The only leaf in Sir W. Hooker's herbarium is more than eighteen inches long, by three-and-a-half broad, and seems to be smooth on both sides.

Wild in the Society Islands—Beechey.

26. CALANTHE ALISMAEFOLIA Lindl. Fol. p. 8:

C. foliis ovato-subrotundis longissime petiolatis subtus glaucescentibus, labelli quadrilobi laciniis lateralibus linearibus intermedia alte obcordata callo maximo carnoso tuberculato juxta basin, calcare labello vix aequali.

Leaves with much the appearance of *Alisma Plantago*; inflorescence nearly smooth; bracts ovate, squarrose; flowers white, tinged with pink, except the sepals,

which are roundish and somewhat green. The very remarkable callosity at the base of the lip is bright yellow.

Wild in Sikkim in hot valleys at 2000 feet—J. D. Hooker; in Khasia, at 4000 feet—Hooker and Thomson.

27. CALANTHE DISCOLOR Lindl. in Sert. Orchid. sub t. 9. B. Reg. 1840. t. 55. L. F. p. 9:

Sepals and petals claret-coloured; lip white tinged with pink.

Wild in Japan—Zollinger.

Calanthe discolor Lindl. Bot. Reg. XXIV. 1838. Misc. 32:

Racemo laxo pubescente, sepalis petalisque acutis, labelli trilobi columnæ omnino accreti pubescentis bilamellati lobo intermedio bilobo 3-carinato, calcare pubescente acuto limbo brevior. Sert. Orchid. sub t. 9.

Introduced from Belgium.

They no doubt belong either to Java or Japan, 1' in height. In this the lip is of a delicate white, with a few spots of pink near the base. Sep. and pet. are of a deep reddish brown, a little disposed to be striped.

Bot. Reg. XXVI. 1840. 55:

Folia oblonga, venis tribus majoribus, caeteris minoribus interjectis, scapo elongato racemoso multifloro brevior. Scapus palmaris ad sesquipedalem florib 8—20. Sepala et petala vinoso purpurea; labellum album, subroseum. — Comm. Aug. Mechelinc of Ghent.

28. CALANTHE STRIATA R. Br. in B. Res. 578. L. F. p. 9:

Limodorum striatum Banks Ic. Kaempf t. 2.

C. bicolor Lindl. in Sert. Orch. sub t. 9.

Flowers yellow, cinnamon-brown at the back. The lip has a bifid linear downy callosity at the base, beyond which rise three lamellæ extending almost to the point each having a minute lamellula at its own base.

Wild in Japan—Kaempfer.

Calanthe bicolor Lindl. l. c.:

Racemo laxo pubescente, sepalis petalisque acutis, labelli trilobi columnæ omnino accreti lobis subaequalibus, intermedio cuneato apiculato trilamellato basi convexo pubescente bicorni, calcare acuto limbo duplo brevior glabro.

Flowers larger, than in *discolor*, bright yellow inside, and rich orange-red externally; when spread open they are nearly 2" diam. Mr. Aug. Mechelinc sent it under the name of *Amblyglottis flava* Blume.

29. CALANTHE GRIFFITHII Lindl. in Paxt. Fl. Gard. sub t. 61. L. F. p. 9:

C. racemo laxo multifloro, labelli lobis lateralibus linearibus obtusis intermedio subrotundo truncato denticulato sub apice dente unico magno aucto, calcare recto pendulo.

A plant with the habit of *C. puberula*. Spur straight, about as long as the lip. A single compressed tooth just within the apex of the lip.

Wild in Bootan; To Chuku, on wet banks at 6000 feet, and above Telagong—Griffith.

L. c. in Paxt. Fl. G. praeterea: „ovario tomentosum,“ „calcare — — pubescentum.“

30. CALANTHE SPECIOSA Lindl. Orch. Nr. 8. (*Amblyglottis* Bl.) L. F. p. 9:

Flowers orange-coloured.

Wild in Java; in the dense woods in the mountainous parts of Bantam and Buitenzorg—Blume.

31. CALANTHE DENSIFLORA Lindl. Orch. Nr. 10. Bot. Reg. t. 1646. L. F. p. 9:

When young the raceme forms a globular mass, completely covered by roundish

ovate, thin deciduous bracts. Each scape is furnished with three inflated sheaths. The column is remarkable for being extended into a long constricted neck above its junction with the lip. Flowers apricot-yellow.

Wild in Sylhet — Wallich; Assam — Griffith; Khasia, at 4000 feet — Thomson and Hooker.

Lindl. l. c.:

Scapo foliis multo brevior, squamis laxis ventricosis, racemis densis multifloris corymbosis, labelli cum columna parum connati lobo medio cuneato bilobo, disco bilamellato, calcare longo recto pendulo apice clavato.

Rhizoma subterraneum, brevissimum, pullulationibus junioribus duris rigidis cornutis sanguineo pallido punctatis. Folia oblongo-lanceolata, plicata. Scapus semipedalis et ultra, squamis 2—3 ventricosis sanguineo-punctatis laxè vaginatis. Flores pallide lutei, in corymbum densum multiflorum congesti. Sepala et petala conniventia aequalia. Labellum cum columna parum connatum, trilobum; lobis lateralibus ascendentibus rotundatis, intermedio cuneato rotundato bilobo basi lamellis 2 cornutis brevibus ornato; calcar curvum pendulum, apice clavatum.

32. CALANTHE PLANTAGINEA L. O. N. 7. L. F. 9. Sert. Orch. t. 24. Griff. ic. t. 339. Flowers pale rose-colour or violet with a darker lip.

Wild in Nepal and Kamaon—Wallich; Namik, at 9000 feet—Strachey and Winterbottom; Bootan, between Tussulling and Chindrippa, 7—7500 feet—Griffith; Sikkim—Cathcart.

Sert. l. c.: Disc. by Wallich: common about roots of trees in various mount. places in the valley of Nipal and in the forest on the summit of Mount Chandaghery. Febr. Roots thick, white, clustered, smooth when old, originally covered with dense white hairs. Stem is a creeping rhizome with round knobs, whence the leaves are produced. Leaves ovate, acute, 6—8", wavy; their stalk 6" deeply channelled, angular gradually widening upwards. — Scape 1—1½' high, often tinged with purple. Racemes 6—8' in length, pale purple flowers; pedicels ½" covered with short down like all the ext. parts of the flow. Bracts linear lanceolate, 4" long, downy, nearly white. Perianth spread open, pale violet. Sepal lanceolate, acute, 3—8"; petals linear. Lip naked, 3 parted, with cuneate obovate segments, of which those of the side are more obtuse, than the middle, which is apiculate, 3 tubercles at the base; some reflexed hairs inside, at the base prolonged into a slender spur, which is notched at the end, pendulous, as long or longer, than the pedicel.

33. CALANTHE HERBACEA Lindl. Fol. p. 10:

C. foliis latis subsessilibus, labelli basi tricostati 4-lobi lobo intermedio alte obcordato, calcare sigmoideo.

Sepals and petals lanceolate, green. Lip pure white. Spur doubly curved yellowish Wild in Sikkim, in hot valleys at 1—4000 feet—J. D. Hooker.

Obs. Cf. Lindley haec vult l. c. p. 10.

Calanthe vestita Lindl. Orch. Nr. 5. Paxt. Fl. G. 147. c. ic. Bot. Mag. t. 4671.

Cytheris Griffithii Wight ic. t. 1751.

Prepnanthe vestita Rehb. fl. in Bot. Ztg. 1853. 493.

Flowers pale cream-colour. Inflorescence extremely shaggy. In a variety there is a deep crimson blotch at the base of the lip. Mr Reichenbach having examined this plant before the pollen-masses adhered to their gland, supposed it to be a distinct genus, which he called *Prepnanthe*, and placed among *Epidendreae*.

Wild in Burma—Griffith, Wallich.

Cf. supra p. 460. — Adde: Paxt. Mag. XVI. 128.

34. CALANTHE CHLOROLEUCA Lindl. Fol. p. 10:

C. racemo raro secundo, labelli nudi 4-lobi laciniis aequalibus rotundatis.

Flowers rich yellowish green. Lip white, with a dull yellowish stain at the base. Wild in Sikkim, in hot valleys at 2000 feet—J. D. Hooker.

35. CALANTHE FULGENS Lindl. Fol. p. 10:

C. racemo capitato paucifloro, labelli 4-lobi nudi laciniis lateralibus dimidiatis intermedio bilobo lunato multo majore, calcare pedicello longiore.

A beautiful plant. Flowers nearly three inches across, deep warm crimson, with a deep purple lip, having at its base a pair of naked yellow streaks.

Wild in Sikkim, in hot valleys at 2—4000 feet—J. D. Hooker.

36? CALANTHE ODORA Griffith notul. III. 365. L. F. p. 10:

I have not seen any specimen which agrees with the account given of this plant, which may perhaps not be a *Calanthe*. Griffith says it has — 1. Scares appearing before the leaves; 2. Flowers large, white and showy, with the smell of Hyacinths; 3. Leaves rather glaucous underneath; 4. A spur two-toothed at the end; and 5. Eight pollen-masses with as many pulverulent caudicles! The only species of *Calanthe* that may correspond with the first char. is *C. vaginata*, Nr. 23; but it is uncertain whether the only specimen of that species at present known, may not be accidentally rather than naturally unaccompanied by leaves, and it differs in all other particulars. Griffith describes the flowering stem of this plant as being a foot and half high.

Wild in Upper Assam, in grassy places; Suddyah, April 10—Griffith.

Cf. etiam Paxt. Fl. G. III. p. 37:

I am acquainted with one other species, but too imperfectly to define it. Viz.:

Amblyglottis pilosa of Prof. de Vriese's Sumatra collection, with white flowers, narrow hairy sepals, naked petals, and a nearly equally four-lobed lip, with a curved sharp spur not half its own length.

1502. LIMATODIS Bl.

Bijdr. 375. Tab. 62. Lindl. Fol. VII. (Nov. 1855).

Differs from *Calanthe* in having the column not merely free but rolled up in the lip. The inflorescence is always lateral not terminal, and the flowers, when dried, acquire a peculiarly thin texture.

1. LIMATODIS PAUCIFLORA Bl. l. c. L. O. Nr. 1. Paxt. Fl. G. sub t. 81. L. F. p. 1:

L. pedunculo bifloro foliis oblongis multo brevioribus, calcare brevi incurvo.

„Flowers white.“ Stem long, leafy at the end only.

Wild in Java; in the thick woods of Mount Salak—Blume.

2. LIMATODIS ROSEA Lindl. in Paxton's Fl. Gard. t. 81. L. F. p. 1:

L. racemo tomentoso multifloro foliis longiore, calcare brevi incurvo.

Flowers bright rose-colour.

Wild in Moulmein—T. Lobb.

Paxt. Fl. G. l. c.:

Pseudobulbis fusiformibus, foliis oblongo-lanceolatis plicatis glabris, scapo multifloro foliis longiore, floribus laxis, villosis, bracteis membranaceis recurvis ovario brevioribus, labello oblongo plano retuso, calcare recto obtuso horizontali, columna nana tomentosa.

Limatodis appears to have a column much elongated while that of *Calanthe* is in general particularly short, but such a difference is unimportant because *C. densiflora* has also a very long column, and the discovery of the present species with a very short column still further destroys any value which the character alluded to may have been supposed to possess. — Near Moulmein prov. Martaban, Lobb.

Psb. long. Stem, flowers with long hairs. Lip destitute at the base of certain callosities represented by Blume.

Labellum omnino laeve, ungue circa columnam nanam convoluto, eique denique per spatium minimum adnato; haud vestigium callositatis aut appendicis cujuscunque. Anthera apice biloba, valde gibbosa, 8 locularis. Poll. 8, sessilia pulverea colligata. Rostellum bilobum, lobis rotundis, prominentibus. Glandula minuta, a rostello vix separabilis.

Mr. Veitch informs us, that this species flowers most abundantly, and that the pseudobulbs invariably have the peculiarity of producing a kind of neck about their middle. In the imported bulbs the part above the neck had all fallen off.

3. LIMATODIS GRACILIS Lindl. Fol. p. 1:

L. racemis multifloris pubescentibus foliis brevioribus, calcare nullo,

Calanthe gracilis L. O. Nr. 17. — B. M. t. 4714. — Griffith Not. 3. 367.

Flowers pale yellow, or according to a drawing of Cathcart's nearly white. Varies much in size.

Wild in Sylhet—Wallich; China, Hong-Kong—Champion; Khasia, at 3—4000 feet—Hooker and Thomson; Sikkim—Cathcart.

Hook. Lond. Journ. l. c. p. 36: On Victoria Peak, with *Cypripedium*, in December. The plant, not unlike *Calanthe* in general appearance, has a terrestrial stem, swollen at the base, and producing a new shoot next to it annually, from one to two feet high, having six or seven, distichous, broad, plaited, satiny, bright green leaves, and upright racemes from one terete scape, shooting from the stem a little above its base. The flowers, from ten to eighteen in the racemes are very odorous at night, with a delicious perfume like Mignonette. Pedicels nearly an inch long, arranged spirally round the scape, somewhat twisted. Sepals yellow, all equal, linear-oblong or obovate, the three exterior forming an equilateral triangle. Spur none. Column short, semicylindrical terminating abruptly. Anther coup opercular; pollenmasses 8, fastened by pairs to the roundish caudicle. Labellum three times as long as the column, at first convex, with a lobe at each side, then produced flatly, lobed and crisped, white with yellow spots. — Champion. — Lem. Jard. Fl. 104. (sub *Cal. gr.*) — Rehb. fil. Bonpl. III. 250: Hongkong Seemann.

4. LIMATODIS PUNCTATA Lindl. Fol. l. c.:

L. racemis subsessilibus paucifloris brevissimis, calcare recto infundibulari, labello undulato acuto.

A broad-leaved plant, with the vaginæ copiously dotted with dull purple. Peduncles numerous, horizontal, two to four-flowered. Flowers white, with a yellowish lip.

Wild in Sumatra.

Species exclusa: *Limatodis mishmensis* Lindl. = *Phajus mishmensis* Rehb. fil. cf. Suppl.

1506. THELASIS Bl.

Bjdr. 385. Tab. 75.

Wight l. c. 1732: *Euproboscis* Griff.:

Gen. Char. Perianth posticous, connivent, fleshy. Sepals linear, oblong, lateral ones keeled. Petals narrow, lanceolate, (reflexed at the

apex). Lip simple entire, semi-convolute, continuous with the oblique base of the column. Column vertical, attenuated in front into a long twolegged rostellum (antice in rostellum bicrure longum attenuatum), stigma vertical. Anther dorsal, beaked. Pollinia 8, waxy, globose, with a long caudicula and linear gland.

Epiphytical caespitose plants, pseudobulbs turbinate, the new ones 3—4 leaved, leaves fleshy, oblong, emarginate, scape subclavate, erect; flowers spiked, one, bracteate, minute, greenish. Griffith Cal. Journ. Nat. Hist. V. 371. 72.

I have thought it advisable to give Griffith's character in full, as I find it does not correspond with my dissections, though in other respects the plant seems identical. The following are the notes made while examining this plant. Perianth connivent, six-parted in 2 rows, exterior series, sepals, larger, the anterior pair carinately winged on the back; interior series, petals, somewhat smaller, sublanceolate, anterior one, lip, 3 nerved. Stamens 3, sessile, opposite the sepals, each containing 8 globose waxy pollinia attached to a long slender caudicula furnished with a linear gland. Column very short (even with the base of the petals and stamen) with a forked rostellum as long as the anthers and to the apex of which, in course of time the glands of the caudicula become attached. Ovary 1 celled, placentiferous margins revolute, free within the cell. Comparing this with the dissections, two discrepancies will be remarked. The stamen at Nr. 7. is represented as double each half with a caudicula and 4 pollinia, and secondly the detached pollen has only 4 masses to the caudicula. In both respects the drawing is wrong as will be at once observed on comparing fig. 7. with the anthers of fig. 6. which are correctly shown 1 celled, but dilated and ventricose below to enclose the large pollinia. In other respects the drawing is correct.

According to Mr. Griffith's character there is only one perfect stamen „anther parallel with the column, dorsal, fleshy, prolonged into a long beak.“ In place of one I find 3 such anthers. Can it be that as compared with mine, his plants were to that extent deficient, or were the anterior anthers overlooked in a hurried dissection? In either case it is extraordinary, first, as it seems improbable that two plants to all appearance so perfectly identical, should differ so widely in so essential an organ; and secondly it seems about equally improbable that such an accurate observer as Griffith should commit such an oversight. But considering the former the more improbable of the two, I may remark that this seems one of the most curious of Orchideous plants. It has 3 perfect stamens furnished with concave pollen and these attached to a caudicle and gland like these of Vandeeae. Lindley rejects Apostasiaceae as a genus of Orchideae; this seems an equally anomalous plant; can it also be similarly rejected so as in that way to preserve the symmetry of the order. For myself I think not.

1. THELASIS PYGMAEA Lindl. 2. Contrib. Orchid. Ind. p. 63. *Euproboscis pygmaea* Griff. Wight l. c. 1732. The specimens from which the plant was first described were from Nepaul and flowered in the Botanical Garden at Calcutta. Those which my drawing was taken of were gathered by Mr. Jerdon on the Malabar ghauts.

Obs. Cl. Lindley l. c. monet, nomen „*Euproboscidis* Griffithii“ non exstare in Calc. Journ. Equidem Lugduni Batavorum apud beat. Blume iconem ex Calc. J. l. c. desumptam mihi delineavi, cui inscripserat Bl. „*Euproboscis* Griffithii.“ Hinc lapsus oritur.

2. THELASIS TRIPTERA Rehb. fil. in Bonpl. III. 219:

Foliis geminis, racemo spicato, ovaris tripartitis.

Folia in pseudobulbis gemina, inaequaliter oblongoovata, apice inaequali biloba cum denticulo interjecto.

Pedunculus gracilis bivaginatus vaginis ochreatis acutis distantibus. Racemus densiflorus oblongus. Bractee triangulae acutae demum refractae, primum squar-

rosae. Flores demum nutantes. Sepala triangula. Tepala subaequalia minora hyalina. Labellum triangulum lateribus auriculiformibus obtusis erectis.

Cuming coll. phil. 2062.

150^o/₁. **JOSEPHIA** Wight.

lc. V. 1851, ante N. 1742.

Perianth globose, closed. Sepals equal, ovate, suborbicular, lateral ones incumbent on the lip. Petals obovate, oblong, obtuse, a little shorter, than the sepals. Lip connate with the base of column, fleshy, ventricose at the base, ecalcarate, constricted in the middle; limb entire, suborbicular, emarginate. Column erect, clavate, half round. Anther imperfectly 2 celled. Pollinia 4, parallel, oblong, clavate, sessile on the dilated shieldlike gland.

Epiphyte plants: leaves coriaceous long petioled, scapes erect, paniced many, flowered, flowers congested towards the ends of the branches, pedicelled and furnished with a minute acute, ovate, persistent bract. The flowers in this curious genus are annually renewed on the old scapes. — This fact I learn from Mr. Jerdon, who had it in cultivation for 3 years. — Seems near *Agrostophyllum*.

1. **JOSEPHIA LANCEOLATA** Wight l. c. 1742:

Leaves elliptic lanceolate acute at both ends; scapes a little longer than the leaves, naked, paniced, branches of the panicle racemose, all the sepals suborbicular; lip emarginate.

Flowers whitish, tinged with purple, lip reddish lilac. Branches of trees below Neda wuttim, Neilgherries, flowered Aug. and Sept.

2. **JOSEPHIA LATIFOLIA** Wight l. c. 1743:

Leaves coriaceous, broad ovate very obtuse or round above, tapering below into the longish sulcated petiole; scape paniced, about twice the length of the leaves, scaly, branches of the panicle short; flowers congested, subcapitate.

Pulney Mountains Aug. Sept.

150^o/₂. **CENTROPETALUM** Lindl.

Sert. Orch. sub Tab. 21.

Sepala et petala libera, labello duplo minora. Labellum obovatum, indivisum, nudum, basi appendice parva excavata auctum. Columna petaloidea, convoluta, basi imo labello adnata. Anthera membranacea, unilocularis. Pollinia 4, distincta geminatim caudiculis 2 longis ascendentibus affixa.

1. **CENTROPETALUM DISTICHUM** Lindl. l. c.:

Caulibus teretibus gracilibus pendulis (vix pedalibus) basi attenuatis, foliis linearilanceolatis, petalis sepalis subaequalibus, sepalis mucronulatis, labello crenato unguiculato glaberrimo petalis parce brevior.

L'ovaire lilas foncé est trois fois aussi long, que la fleur; les sépales et pétales sont lilas foncé ou plutôt d'un violet vif; le labellum est rose avec une tache d'un jaune orange à la base. Cette espèce appartient à ce petit groupe des Eudendrobium transp., dont le Dendrobium cretaceum fait partie, qui par avortement ne produisent ordinairement qu'une fleur au lieu de deux à l'aisselle de chaque feuille. Quoique les fleurs soient assez grandes, et bien colorées, la plante ne produit cependant aucun effet parceque les fleurs sont trop éloignées les unes des autres et n'offrent rien de gracieux en raison de la longueur exagérée de l'ovaire, qui forme une ligne presque horizontale avec la tige sans feuilles.

pag. 563. Omisimus monographiam *Zygostatis* Lindl. Fol. I:

Sepala membranacea, subaequalia, libera, reflexa. Petala membranacea, unguiculata, patentia, majora. Labellum pariter membranaceum, cymbiforme, basi appendice libera incurva auctum. Columna libera, elongata, arcuata, teres; rostello longissimo, recurvo. Stigma area triangularis ad basin rostellum Adest praeterea ad basin columnae utrinque brachium subcarnosum, liberum, horizontale, apice dilatatum, columnae ipsius longitudine. Pollinia 2, pyriformia; caudicula e basi cuneata in setam geniculatam producta; glandula angusta, ovali. Anthera membranacea, acuminata, rostellum ipsum recurvum haud tegens. Herbae epiphytae, acaules, Brasilienses, ebulbes. Folia pauca, angusta, carnosae. Racemi penduli, floribus parvis herbaceis.

The relation of this, in a very near degree, with *Ornithocephalus*, of which it has much the appearance, is unquestionable. The distinction mainly resides in the presence here of a linear horizontal arm on each side of the column at its base, and of a fleshy incurved process at the base of the lip standing between the arms. What is the signification of these arms, and of the intermediate process? When the genus was published in the „Botanical Register“ I compared the arms to the column ears of *Burlingtonia*; upon which supposition the customary sterile stamens of *Orchidaceae* must be assumed to be occasionally free. It is, however, not improbable that the apparatus in question may consist of three abortive stamens belonging to two different whorls. Dr. R. Brown long since (*Wallich Pl. As. rar. I. 7*) pointed out the possibility that the processes of the lip found in *Pterostylis*, and certain other genera, might represent staminal apparatus, completing the customary number of male parts found in *Endogens*. He even remarked that „perhaps it may be considered as indicated in all cases, where the labellum is furnished with a process, however minute, arising from its axis.“ I have not seen reason to express publicly an acquiescence in that hypothesis, not having succeeded in finding satisfactory evidence of its truth; on the contrary, it has appeared to me that the processes in question might as justly be referred to the stigma: I am, however, bound to admit, that upon the whole there is an accumulation of facts so much in favour of the theory of the sagacious observer above mentioned, that it becomes more and more probable. It is especially to be noted, that the number of processes found on the lip is usually one, two or three; the latter being the more common. In some instances, one may represent the front abortive stamen only, two may represent the two laterals only, and three may represent them all. It is also remarkable, that where three processes or three rows of processes are present, the two lateral are generally the largest, as if they represented a more vigorous series of development than that in the centre. To which it may be added, that where more, than three rows of processes are present, nevertheless, the number three seems fundamental. The scientific reader will readily understand this by reference to the accompanying diagram, in which the supposed inner series of stamens is represented by three black dots (•), and the outer series by as many open dots (◦).

Upon this hypothesis the two outer abortive stamens of *Zygostates* are represented by the free horizontal arms, and of the three inner the two lateral are altogether undeveloped, while the anterior appears in the form of the fleshy process at the base of the lip.

1. ZYGOSTATES CORNUTA Lindl. l. c.:

Z. petalis rhomboideis medio tantum serratis, labelli appendice integra, brachiis apice bilobis.

Spike about four inches long, with short acute bracts. Leaves narrowly lanceolate, not so long. Sepals ovate, obtuse, the dorsal revolute at the margin. Petals wedge-shaped and entire at the base, as well as the apex. Lip serrated like the petals, crimson, acute. Horizontal arms dilated and 2-lobed at the end.

Wild in Brazil—Prince Maximilian of Wied Neuwied.

2. ZYGOSTATES LUNATA Lindl. l. c.:

Z. petalis lunatis inciso-serratis basi cuneatis integris, labelli appendice apice 3-loba, lobis lateralibus divergentibus, brachiis apice globosis.

Very like the last, but the flowers are larger and further apart. The petals are not entire at the point, but regularly fringed all round, except at the cuneate base; the appendix of the lip terminates in two diverging lobes, and the horizontal arms are globular at the end. the column is also more slender. Sepals whitish. Petals greenish-yellow, according to Descourtilz.

Wild in Brazil; on trees near the town of Mariana, in the province of Minas-Geraes—Martius; on trees on the highest wooded mountains of the district of Bananal,

in the midst of dense cold fogs, which are almost perpetual, flowering in March. Descourtilz's drawing^s Nr. 4.

Folia 15" longa, 1" lata; pseudobulbi 3 pollices longi, 2 pollices lati. Scapus bi—tripedalis. Flores magni speciosi, marcescentes: petala et sepala viridilutea maculis olivaceis notata; labellum album basi dilute-purpureum et striatum. Columnae summa pars circa stigma aurantiaca, alae antheraeque purpureae.

Hab. in Brasilia.

Blumenabtheilungen grünlich gelb, olivenbraun gefleckt. Kronenlippe weiss, am Grunde hellpurpurn verworchen, und zugleich dunkelpurpurn gestreift, Oberr Theil der Säule sowie die Umgegend der Narbe orangefarben; Flügel, sowie Anthere purpurfarben.

Blumenschafft ist beinahe 3' hoch mit ausgesperreten Aesten und zahlreichen 1" Diam. habenden Blumen besetzt. Gewächshaus Laeken, blühte 2 Monate lang.

pag. 817. *ONCIDIUM OBOVATUM* Presl. Reliq. Haenk. I. 99. Pseudobulbus 4-polllicaris. Folia ignota. Scapus terminalis, pedalis, erectus, vaginis membranaceis albidis vestitus, apice paniculatus. Panicula simplex, patula, 4 pollicaris. Bractee linearilanceolatae acutae membranaceae, inferiores $\frac{1}{2}$ poll. longae. Perianthium recto patens. Sepala linearilanceolata acuta aequalia 5 lineas longa. Labellum aequilongum obovatum integrum erectum, patens, basi supra cristatum. Columna apicem versus alata, apice tridentata, dente medio in rostrum rotundatum prolongato. Mexico. — Known only from Presl, whose habitat is possibly wrong. If the scape is really terminal, this plant is perhaps not an *Oncidium*.

pag. 817. *ONCIDIUM GLOBULIFERUM* H. B. K. — L. O. 202: bulbo subgloboso foliis oblongis brevissime mucronatis, scapis simplicibus subunifloris, foliolis calycis subaequalibus crenulato undulatis, labello subreniformi apice emarginato bilobo, gynostemio apice ala crenulata, cincto. Popayan. — Flowers red, spotted. Lip very large, with small lateral lobes.

pag. 817. *ONCIDIUM FORKELII* Scheidweiler Gartenztg. 1842. p. 309. Lindl. B. R. 1843. Misc. 14:

Pseudobulbis monophyllis; foliis coriaceis, oblongis, acutis, vaginis ciliatis; scapo erecto punctato, trifloro, foliis brevioribus; sepalis lateralibus liberis, oblongo-ovatis, acuminatis; superiore ovato-undulato; petalis oblongis margine undulatis; labello trilobo, lobis lateralibus minoribus, intermedio maximo rotundato baseos callis duobus instructo anteriore compresso bicornis, posterioris lamina plicata; gynostemio alato, alis lilacinis. Anthera carnosae, galeata, pollinia duo in glandula sessilia.

Folia 10—12" longa, 3—4" lata. Sepala extus fusco-maculata, petala apice virentia basi fuscata, labellum lilacinum. — A Mexican species, that has flowered in the coll. of His Majesty the King of Belgium, at Laeken. It has been named after Mr. Forkel, the chief gardener there. It is said to be one of the handsomest of the genus, with flowers 1" in diam., greenish yellow, spotted with crimson; the petal clear violet, the lip large and round, with small side lobes.

pag. 817. *ONCIDIUM GALEATUM* Scheidw. Allg. Gartenztg. 1839. 40:

Sepalis lateralibus subfalcatis integerrimis, supremo galeato, unguiculato, petalis undulatis, obtusis, labelli lobis late rotundatis, crenulatis, intermedio trapeziformi, crista lobis tribus composita, lobis crenato undulatis; columna alis porrectis, obtuse repandis.

Pseudobulbi oblongi compressi; folia tria, oblonga, coriacea, nitida, acuta Scapus paniculatus multiflorus bipedalis et ultra. Brasilia.

Dreiständige, lanzettliche, lederartige, oben spitze glänzende Blätter. Aeusserer seitliche Hüllblätter ganz, stumpf, gelb, mit je 2 runden braunen Flecken. obre Abtheilung helmförmig mit braunen Querstreifen, innere Hüllblätter wellenförmig mit mehreren Flecken. Lippe ist unverhältnissmässig gross, Seitenlappen abgerundet gekerbt, der mittlere trapezförmig gelblich, ohne Flecken; Flügel der Säuleausgestreckt geschweift. Schaft über 2' hoch, vielblüthig.

pag. 822. *PACHYPHYLLUM PASTI* Rehb. fl. Bonpl. III. 239:

Vaginis opacis obscure nervosis margine ciliatis, foliis ovatis apiculatis margine ciliato denticulatis, tepalis ligulatis retusis acutis margine denticulatis, labello ligulato medio utriusque obscure angulato, carinulis 2 falcatis in disco.

Caulis 8—9pollicaris. Vaginae siccae hinc purpureo aspersae. Folia semipollinaria, plura adhuc minora, longitudini semifata. Bractee triangulae carinatae minutae. From the Volcano of Pasto at 1200 f. of elev.; on trees. Ecuador. 439, 1849 Jamieson.

pag. 833 : restituatur ODONTOGLOSSUM ROSSII Lindl. pro specie. Nam *Odontoglossum apterum* Lex. recte differt. Si quidem est species nobis cognita, est *Od. nebulosum* ob pseudobulbos ovatos, columnam crassam, scapum teretem, flores albos centro purpureomaculatos. Ubi enim omnino centro maculati dicuntur, debent etiam in labelli basi maculae occurrere. Omnia sectionis *Odontoglossa* hic vere assidue iterum iterumque perlustravi, ubi novam *Odontoglossum Warnerianum* descripsi.

pag. 863. PHALAENOPSIS PALLENS Rehb. fl. Mss. Huc: *Trichoglottis pallens* Lindl. Journ. H. Soc. V. 34. et Paxt. Fl. G. 15. Dwarf erect plant, with oblong distichous leaves and a lateral flower or two, not quite 2 inches in diameter, pale delicate green, with delicate brownish spots and a white lip. The latter organ was oblong, with a white, shaggy crest on the upper side and a pair of short yellowish scimitar-shaped segments standing erect near the base, within these were a pair forked callosities, one placed before the other in the centre, but no sac or pouch was found between there. *Stauroopsis pallens* Rehb. fl. Otto Hamb. Gtz. 1860.

pag. 868. 13. b. VANDA WIGHTII:

Aff. V. Stangeanae Rehb. fl. foliis longissimis anguste ligulatis apice inaequali acute bilobis, pedunculo paucifloro, laxifloro, labelli auriculis subquadratis, lamina late ovata apice contracta ligulata, obtuse biloba, calcaris conico, carinis geminis crassis per discum, basi carinarum ac basi auricularum pilosulis, columna pro genere gracili.

Die Blätter dieser Art sind ungemein stattlich und stehen sehr dicht gedrängt, die Länge eines Fusses überschreitend. — Die armlüthige Blüthentraube hat Blüthen, welche getrocknet so gross, wie die frischer *V. concolor* Bl. Getrocknet sehen sie lederbraun aus, die Lippe ist heller, gelblich. Nilgherries Wight!

(Knth. en. I. p. 11. suppl. p. 9–11).

1. **EHRHARTA COLENSOI.**

Hook. Fl. Nov. Zeland. p. 288 Tab. 65a.

Glaberrima, caespitosa, culmis ramosis curvis subdistiche foliosis, foliis confertis suberectis strictis lineari-subulatis, intus scaberulis, vaginis brevibus, ligula brevissima, panicula suberecta contracta, ramis panicis brevibus, spiculis striato-nervosis, glumis acuminatis inferiore 3–5-nervi superiore 5—nervi, flosculis inferioribus basi barbatis fl. neutr. palea 7-nervi aristata, fl. hermaphr. palea inferiore brevi truncata superiorem linearem duplo longiore, staminibus 2, antheris oblongis.

Hab. Northern Island Nov. Zeland. Colenso. Descriptio l. c.

738. **MICROLAENA.**

(Knth. en. I. 1. p. 16 et I. 2. p. 12.)

1. **MICROLAENA GUNNII** Hook. fil. (Flora Tasm. 2 p. 105 f. 155 A), culmis elongatis foliosis vaginis foliisque scaberulis pilosisve, racemo elongato subsimplici, pedicellis breviusculis, glumis minimis acutis stipite florum aequilongis, aristas palearum inaequalibus, paleis scaberulis v. dorso ciliatis inferiore intermedio $\frac{1}{3}$ brevior, floris hermaphroditis inferiore acuminato v. subaristato.

Habitat in Tasmania, Penquite prope Launceston, (Gunn), Cheshunt (Archer), Huon River (Oldfiels).

Culmi caespitosi, inferne ramosi, 2-3-pedales; foliorum lamina 2-pollicaris; racemus gracilis, nutans, 6–8 poll. longus; spiculae $1\frac{1}{2}$ lin. longae, arista inferiore altera tertia parte brevior, palea profunde sulcata. *M. stipoidi* valde affinis sed major, magisque scabra et pilosa, pedicellis brevioribus. —

738. **DIPLAX** Sol.

(Walp. Ann. III. 921).

1. **DIPLAX TASMANICA** Hook. fil. (Fl. Tasm. 2. p. 105, f. 155 B): glaberrima, culmis caespitosis basi foliosis (foliis planis) superne gracilibus, racemo brevi rarifloro, spiculis longe pedunculatis, gluma superiore obtusa inferiore ter majore paleis $\frac{1}{4}$ brevior, fl. neutr. paleis breviter aristatis, fl. hermaphr. palea inferiore subacuta, staminibus 2.

Habitat in Tasmania: Recherche Bay (Gunn.). Gramen molle, caespitosum, pedale.

Folia 4 poll. longa, $\frac{1}{6}$ lata. Racemus e spiculis 6–8, $\frac{2}{3}$ poll. longis compositus.

2. **DIPLAX POLYNODA** Hook. fil. (Fl. Nov. Zel. p. 290); glaberrima, culmis gracilibus elongatis nodosis ramosis, foliis angustis, racemis simplicibus paucifloris, spiculis inferioribus breve pedicellatis, paleis fl. neutr. breviter aristatis, inferiore paulo brevi ore fl. hermaphr. palea inferiore acuta v. mucronata, staminibus 4.

Habitat in Nova Zelandia: Northern Island, in parte orient. ad basin jugi Ruahine: *Colenso*.

BECKERA Fresen.

(Endl. gen. suppl. I. p. 1353 n. 749/4).

Figari et de Notaris fragm. Agrost. aegyptiacae in Memorie dell. acad. di Torino 1854 p. 320.

Locustae a dorso tereti-compressae, 1-florae hermaphroditae. Gluma 2-valvis exigua cupulaeformis. Valvulae membranaceae concavae obtusissimae enerves, inferior superiore paulo minor. Paleae longitudine subaequales, palea inferior late ovata, subcuniculata, margine utrinque inflexa, superiorem semiamplectens, 5-nervis, ap 2-mucronato-setigera, seta palea multo longiore e nervo medio excurrente prodeunte. — Palea superior tenuior, cuniculata convoluta 3-nervis, nervis excurrentibus 3-mucronata. Paleolae nullae (?) Stam 3. Antherae lin.-oblongae. Ovar. distylum. Styli subulato-filiformes, b. connascentes, longi. Stigmata plumosula, pilis simplicibus. — Herba debilis, e nodis saepius ramosa.

Locustae simpliciter racemosae. Racemi spicaeformes tenues laxiusculi longe pedunculati, axillares saepius geminati.

1. **BECKERA POLYSTACHYA** Fig. et Notaris in Mem. d. Acad Tor. 1854. p. 321. tab. III. 1—7.

Culmus parte inferiore non computata quae deest in specimine nostro, pedalis, tenuis flaccidus, ad nodos inferiores geniculatus, laevissimus. F. membranacea linearia, 3-millimetra latitudine aequantia, ex ap. acutato-cuspidata, laxe ciliata, cum vaginis internodiis aequalia v. breviora. Vaginae breves striolatae laxae. Ligula membranacea truncata fimbriifera. Racemi 2 centim. longitudine vix excedentes, laxiflori, pedunculati, terminalis solitarius, laterales ex vaginar. axilla gemini, ramulo plerumque stipati. Ped. inaequales, hic vaginam bracteaeformem vix superans, alter ea duplo saltem longior. Glumae valvulae laeves, membranaceae, marg. sub vitris acri oribus argute denticulatae. Palea inferior dorso et ad nervos praesertim scabra, 5-nervis, nervis validis prominentibus, apice 2-mucronato-setigera, nervo dorsali nempe in setam scabram palea ipsa sesquilongiorem producto, intermediis paleae apicem ciliolatum excedentibus. Palea superior inferiore paulo longior, tenuiorque, dorso superne scabrida, 3-nervis, nervis paleae apicem rotundatum excedentibus, 3-mucronata. Caryopsidem non vidimus. —

In Nubia superiore.

Tribus II. **PHALARIDEAE** Kth. Gram. p. 18.

(Walp. Ann. III. p. 711.)

743. **COIX** L.

Kth. en. I. p. 20. suppl. 16..

COIX STIGMATOSA C. Koch et Bouché. Ind. hort. Berol. 1855.

Perennis, pluricaulis, ramosa; ligula brevissima; folia undulata, gla-

berrima; spicae laterales binae ternaeve, simplices, masculae paucifemineae unispiculatae. Stigmata elongata, densissime papillosa.

Coix Lacrymae L. affinis, sed radice perenni habituque ampliore multum discrepat C. agresti Lour. et exaltatae Willd. sunt culmi solidi, C. arundinaceae Koern. contra speciei mihi plane ignotae, spiculae axillares et subsessiles.

Folia elongata, anguste lineari-lanceolata, nitentia; spicae heterogamae: mascula pedunculo complanato longiore insidens; spicula biflora, glumis chartaceis, oblongis, acutis, multinerviis, flores totos amplectentibus; paleae membranaceae, inferior major; lodiculae duae inaequales, carnosulae, apice truncatae; pedicellus ad latus singulae spiculae brevis, spiculum incompletam et parvam gerens; spica altera et tertia feminea involucre ovato, duro, marginibus connato cum 2—3 spicis aliis abortivis et ex parte emergentibus inclusa, unispiculata; glumae involucriferae, intus spongiosae inter se connatae, florem unicum amplectentes; paleae complanatae, enerviae, carnosae, membranaceae, ovatae, in cuspidem subito attenuatae, inferior paulo major; stamina 3 effoeta; lodiculae nullae; germen ovatum, compressum: stylus ad apicem pilis papillosis obsitus; stigmata duo, densissime papillosa, elongata.

2. COIX LACRIMA Beauv. (Knth. Agr. p. 20. 1). Buse in plant. Jungh. III. p. 396.

γ. *oocarpa* Buse; involucre parum nitente, ovali fere symmetrico.

Hab. ins. Javæ per Weltevreden. (Jungh.)

746. **MIBORA** Ad.

1. MIBORA DESVAUXII Lange (pugillus plant. inprimis hispanic. I. p. 24): 2—4-pollicaris, folia laxa et plana, latiora et longiora quam in *M. minima*, dimidium culmorum et ultra attingentia, spiculae magis remotae (singula spicula basin — nec medium ut in

M. minima — proximae attingens), color totius herbae pallidus — Willk. et Lge.: Podromus fl. hisp. I. p. 38. — *Agrostis minima* Schousboe.

Hab. in collibus arenosis Galliciae ubi abundat. (c. Lugo et Santiago de Compostela Lge.), in Lusitania (Shousboe) et Gallia austr. (Lge.).

2. MIBORA MINIMA. Desv.

Explor. scient. de l'Alg. phaner. p. 60.

747. **ALOPECURUS** Linn.

(Walp. Ann. III. p. 711).

1. ALOPECURUS CASTELLANUS Boiss. et Reut. (Diagn. 26) differt ab *Al. pratensi* colore glaucescente, thyrso ovoideo-oblongo $\frac{3}{4}$ —1" l. glumis non nisi basi connatis, ad carinam longissime ciliatis, arista palea subduplo longiore. — *Phalaris utriculata* Schousb. sec. Willk. et Lge. Prodr. fl. hisp. I. p. 40.

Hab. in pascuis regionis inferioris Castellae novae (ad fl. Manzanares, circ. Chamartin, Guadarama, Aranjuez, Reut., Escorial, Gulopar. Lge.) atque Estremadura (arroyo del Puerto Schousb.).

2. ALOPECURUS (EUALOPECURUS) LAGURIFORMIS Schur. Wiegmanns Archiv. 1852. I.

p. 362, rhizomate repente, foliis planis, superioribus vagina ventricosa brevioribus stolonum angustioribus, ligula abbreviata, panicula ovoideo oblonga, glumis basi connatis elliptico-lanceolatis, apice recto acuis, carina longe sericeo ciliatis florem obtusiusculam paullo superantibus, arista paleae tertia parte supra basin inserta geniculata, glumas fere duplo superante, stylis inferne connatis. — Medius inter *A. pratensem*, et *A. glaucum* Less.

Hab. in Transilvania, in Carpathis meridionalibus.

3. ALOPECURUS CASSIUS Boiss. (Sect. *Colobachne*).

Diagn. pl. or. XIII p. 41.

A. perennis glaber radice perenni culmis caespitosis basi vix fibroso-vaginat. foliis planis anguste linearibus glaucescentibus margine scabris inferioribus expansis caulinis paucis vagina elongata subdilata, limbo brevi, ligula ovata denticulata, panicula spicaeformi terminali oblonga, ramis paniculae 4—5floris, glumis oblongo-lanceolatis aequalibus basi connatis undique dense hirsutis apice divergentibus in aristam brevem attenuatis, flosculo glumis parum breviori, palea superiori glabra trinervi apice oblique truncata obsolete tridentata superiori breviori anguste lanceolata uninervi, arista ad tertiam partem inferiorem dorsi paleae inferioris inserta incurva flosculo duplo longiori spiculam superanti.

Habitat in regione alpina montis Cassii. Legi Junio 1846.

Affinis *A. vaginato* qui differt vaginis omnium foliorum culmorum valde inflatis, radicalibus setaceo-linearibus, spicis majoribus ovato-rotundis, glumis densius et longius hirsutis, flosculo apice hirtulo. *A. Gerardi* aristis inclusis etc. longius distat.

4. ALOPECURUS AUCHERI Boiss. in Kotschy pl. Pers. bor. 1845 (Sect. *Eualopecurus*).

Boiss. diagn. l. c. p. 41.

A. perennis rhizomate fibroso stolones repentos longiusculos edenti, collo vaginis in fibras solutis stipato, foliis planis viridibus glabris radicalibus abbreviatis fere expansis, superiorum vagina elongata subinflata striata limbo brevi, ligula brevi truncata glabra, panicula spicaeformi ovato-oblonga ramis 3—5floris, glumis oblongo-lanceolatis subaequalibus carina praesertim hirsutis in aristulam eis quadruplo brevior attenuatis basi breviter connatis, glumella unica glumis tertia parte breviori apice eroso-truncata glabra basi arista geniculata spicula duplo longiori obsita.

Hab. in monte Elbrus Aucher No. 5457, ad nives deliquescentes ejusdem jugi supra pagum Asadbar Kotsch. loc. cit. No. 464.

Pedalis vel altior, spicae 8—9 lin. longae. Habitus *A. Gerardi* a quo praeter glumellae superioris defectum differt valvis longius aristulatis, corollae arista multo longiori. *A. vaginatus* foliis inferioribus angustissimis etc. longius distat.

3. ALOPECURUS ANTHOXANTHOIDES Boiss. (Sect. *Eualopecurus*). Boiss. diagn. l. c. p. 42.

A. annuus glaber, radice fibrosa, culmis tenuibus erectis ascendentibusve, vaginis striatis suprema praesertim elongata inflata, limbo lanceolato acuminato rigidulo, ligula truncata tubuloso-convoluta, spica terminali ovato-oblonga subdisticha, glumis oblongo lanceolatis acutis compressis carinato-subulatis albidis viridi-trinerviis carina hirta-scabridis praeterea basi marginibus et carina ciliatis aequilongis superiori angustiori, glumella unica glumam aequanti ad $\frac{2}{3}$ usque utriculiformi lanceolata acuta trinervi glabra basi arista geniculata spicula subtriplo longiori aucta.

Habitat in monte Cassio Syriae borealis.

Habitus omnino, spicarum et spicularum magnitudo *Anthoxanthi aristati* Boiss. Voy. Esp. = *A. Carreniani* Parlat. sed spiculae uniflorae, glumella solitaria utriculiformis *Alopecuri*. Ab omnibus hujus generis speciebus spica subdisticha spiculisque magnis distinctissima, juxta *A. ulriculatum* collocanda.

6. ALOPECURUS NIGRICANS Horn. β . SUBMUTICUS Lge, (pag. I. p. 25); Willk. et Lge. Prodr. fl. hisp. I. p. 40. — Bull. Mosc. 1842. p. 527. Rhizoma repens; ligula brevissima, truncata, ciliata, dorso pubescens, vagina folii superioris ventricosa; arista nulla v. brevissima ad medium fere paleae obtusae egrediens. — *A. muticus* Kar. et Kir. Bul. exs. Alg. 963, Steud. Synops. p. 148. n. 10. — *A. pratensis* β . *ventricosus* Coss. et DR. expl. Alg. excl. synonym.

Habitat ad rivulas prope oppidum Jaen (5. Maj.) Plurimis convenit cum *A. nigricante* Horn., sed ex mea sententia nec cum *A. pratensi* nec cum *A. Castellano* associari debet, quas omnes species in unam conjungunt Coss. et DR.

7. ALOPECURUS GENICULATUS L. — Hook. fl. Fl. Nova Zeland p. 290. *A. australis* Nees in Mitchells Australia.

Hab. Nova Zeland. locis palud. Northern et Middle Islands. Ora orient. *Colenso*, Canterbury *Lyall*.

8. ALOPECURUS FALLACINUS Gren.

Florula Massil. advena 1859. p. 21.

Radice longe lateque stolonifera, culmo foliisque virentibus, ligula brevi; glumis calycinis basi liberis, dorso villosis, ap. acutis et rectis.

Species affinis *A. pratensi* et *nigricanti* sed notis citatis distinctissima.

In vicinitate Massiliae.

750. PHLEUM Lin.

(Walp. Ann. III. p. 712).

1. PHLEUM GRAECUM Boiss. et Heldr. in pl. Graeciae 1848. — Boiss. diagn. XIII. p. 42.

Ph. annuum glabrum radice fibrosa, culmis e collo pluribus erectis foliosis superne rubellis, foliis viridibus laeviusculis, inferioribus anguste linearibus sub anthesi jam exsiccatis flexuosis superiorum vagina elongata subdilata limbo lanceolato vagina multo breviori, ligula oblonga truncata subglabra culmum involventi, spica e folio supremo remotiuscula cylindrica densa, spiculis compressis, glumis lanceolatis carinato-

plicatis superne modice divergenti-incurvis in aristam brevem acuminatis dorso viridibus carina a medio sursum longe ciliato-pectinatis margine late membranaceis et superne brevius tenuisque sub lente hirtulis, flosculo glumis sextuplo minori oculo nudo vix perspicuo glaberrimo, palea inferiori ovata apice truncata erosula quinque-nervi superiorem multo angustiorum obtusam involventi, rudimento flosculi secundi nullo.

Hab. in campis sterilibus prope Athenas Heldr. Apr. 1848.

Culmi 10—14 pollicares, spica 1 1/2-2 poll. longa diametro 3 1/2-4 lin. lata, glumae sesquilineam aut paulo amplius longae. Species pulchella affinis *Ph. arenario* quod praeter rudimentum flosculi superioris differt culmis humilibus, spicis abbreviatis, glumis introrsum nec extrorsum curvatis etc. Habitus *Ph. Boehmeri* caeteris neglectis radice perenni diversissimi.

Obs. I. *Crypsis pygmaea* Jaub. et Spach. Illustr. pl. Orient. tab. 307 est *Rhizocephalus Orientalis* Boiss. Diagn. 5.

Obs. II. *Pappophorum Aucheri* Jaub. et Spach. Illustr. pl. Orient. tab. 323 est *Eneapogon Persicus* Boiss. Diagn. 7.

2. **PHLEUM PRATENSE** L. — Steud. Synops. p. 150. — abbreviatum Boiss. (Voy. II. 663.) culmi caespitosi 2—4' l., foliis latis planis thyrsis ovoideo s. oblongo 1/4-1/2' l. (*P. mycrostachyum* Nym. Syll. ?) Ex Willk. et Lge. Prodr. fl. hisp. I. p. 39.

Hab. in Hispania: Sierra Nevada, reg. alp. ad 6500—9500', *Bs.*, *Wk.*, *Fk.*

3. **PHLEUM ALPINUM** L. — Steud. Synops. p. 150. α *genuinum* Wk. (Prodr. fl. hisp. p. 40.) rhizoma fibrosum repens, thyrsus nigricans v. violascens, β *tuberosum* Wk. (l. c.), rhizoma nodoso incrassatum; thyrsus pallide virens.

Hab. etiam in Hispaniae regione montana et subalpina passim, β . in S. de Moncayo.

753. PHALARIS L.

(Knth. en. plant. I. 30 et I. 2 p. 23).

1. **PHALARIS PARADOXA** L. (Knth. en. I. 33.). Explor. scientif. de l'Algerie phanerog. p. 24. — *Ph. praemorsa* Lmk. Enc. — var. α . *intacta*. — Panicula majore; spiculis imperfectis haud praemorsis.

Var. β . *intermedia*. — Spiculis imperfectis ramorum inferiorum tantum praemorsis. Var. γ . *praemorsa*. — Spiculis imperfectis ramorum omnium praemorsis, cuneatis, minimis obtusissimis.

Ph. appendiculata Schulte — *Ph. dentata* Sieb. pl. Alg. sicc.

Hab. in culis pr. Alger., in Hispania australiore; Aegypto; Abyssinia. —

2. **PHALARIS AMBIGUA** Figari et Notaris Acta Tor. 1851. p. 327 tab. VI. f. 1—7. Characteribus validioris momenti, nempe flosculo, rudimento floris sterilis lineari-lanceolato squamaeformi instructo, c. Phalare minore et *Ph. gracili* cl. Parlatores apprimo congruit, attamen nulli tute subscribenda. A *Ph. minore*, in Liguria haud rara, diff. locustis amplioribus, sub vitro scaridis, valvular. alis plerumque abrupte desinentib. panicula brevior: a *Ph. gracili* vero vagina superiore, numquam in vivis speciminib. aphylla, panicula duplo saltem majore, ligula ovata, valvularum ala truncata excurrente.

In arvis Aegypti centr. et inferioris Januario et Febr. —

Cf. l. c. pl. descr. amplam.

3. **PHALARIS PSEUDO-PARADOXA** Figari et Notaris in Act. Tor. 1854 tab. VII. 1—11. A communi *Ph. paradoxa* facile insignitur locustis omnib. flosculorum neutrorum pedicellatorum pari utrinque auctis; glumae valvulis ala dentiformi, rarius denticulata

praeditis, simulque b. conjunctis, 9-nerviis. Panicula nitoris omnino expers, magis quam in paradoxa compacta, locustae perfectae glabrae. Num lusus Ph. paradoxae? —

Vide l. c. pl. descr. amplam.

754. **HOLCUS** L.

(Knth. en. I. 34, et suppl. p. 21).

Considerations sur la structure de quelques espèces du genre *Holcus* par MM. B. Balansa et J. Groenland. Bulletins de la Soc. bot. de France, I. p. 365.

1. **HOLCUS CAESPITOSUS** Boiss. Voy. p. 636 t. 173 a.

Perennis radice caespitosa fibrosa, culmis humilibus b. ramosis, f. velutino-glauciscentibus, panicula ovata aequali pauciflora, flosculo utroque hermaphrodito, glumellis externis amborum aristatis, arista geniculata calycem superante.

H. caespitosus Boiss. in bibl. univ. Gen. Febr. 1838. — El. a. 184. — Webb Otaia Hisp. tab. I.

Radix fibrosa perennis, caet.

In glareosis regionis nivalis abunde, Sierra Nevada in declivitate montis Mulahacen, Vacares versus, in valle summo Corral de Veleta pulcherrimus. Alt. 8000—10000 Fl. aest.

2. **HOLCUS GAYANUS** Boiss. Voy. p. 637. tab. 173b.

Radice annua fibrosa, culmis tenuibus humilibus foliosis, f. hirtulis limbo brevi panicula terminali pauciflora subcontracta, pedicellis scabridis glumis inaequalibus attenuato-acuminatissimis carina scabris caeterum glabris, flosculo inferiori mutico sessili b. nudo, superiore pedicellato b. piloso, glumella exteriori supra aristae insertionem bifida paulo infra ap. arista longe exserta, ad med. geniculata, ea quadruplo longiori instructa.

H. tenuis Gay in schedis Durieu pl. exs. non Spreng. Radix fibrosa, caet.

Hab. in rupestribus montium Asturiae loco la Penna de Santa Anna dicto, ubi Durieu detexit anno 1833. —

755. **HIEROCHLOA** Gm.

(Knth. en. I. 35 et I. 2. p. 25).

1. **HIEROCHLOA BOREALIS** R. S. Steudel Synops. p. 13. Hook. fl. n. Nova Zeland p. 300. — *H. Frateri* Hook. fl. n. ant. p. 93.

Hab. in Nova Zelandia: northern et middle island; in cacumine montis Ruahine Colenso: in montibus prope Nelson (Monro).

2. **HIEROCHLOA ORIENTALIS** Fries et Heuffel Verh. d. zool-bot. Gesellsch. zu Wien. 1858. p. 224): panicula coarctata, densa pedicellis glabris erectis, floribus pubescentibus, hermaphrodito mutico, masculis margine barbatis, sub apice brevissime aristatis, foliis lanceolato-linearibus, utrinque margineque scabris; radice repente. — In agris arenosis legionum Illyrico- et Teutonico-banaticarum. Apr. Mai.

756. **ANTHOXANTHUM**.

(Knth. en. I. 37 et suppl. p. 28).

ANTHOXANTHUM OVATUM Lag. — Knth. l. c. p. 38. — Lag. (nov. gen. sp.)

Annuum, multiculme culmis $\frac{1}{2}$ — 1 l. thyrso 1— $\frac{1}{2}$ " l. ovato oblongo, basi truncato, compacto, glumis dorso et margine longe ciliatis, floribus sterilibus fertili dimi-

dio longioribus, inferioris arista glumam superiorem aequante. — Boiss. Voy. II. p. 637! Ex Willk. et Lge. Prodr. fl. hisp. I. p. 38.

Hab. in sabulosis litoralibus Hispaniae australis prov. Etiam in Sicilia et Graecia.

2. ANTHOXANTHUM ARISTATUM Boiss. Voy. p. 638. Lange pug. I. p. 27. exsicc. n. 18. Willk. et Lge. Prodr. fl. hisp. p. 38. — A. *Carrenianum* Parlat. plant. nov. p. 37. Steud. Synops. p. 13.

Hab. in graminosis regionis mont. regni Legion (Pto. de Manzanal) et utriusque Castell. (prope Madrit; Carr., et Escorial (Guadarrama, Lge.). In Algeria et Sardinia insula.

Ab *Anth. Puelli* (quocum etiam ab ill. Boissier olim confusum) differt: panicula spiciformi ovali v. ovali-oblonga, basi dilatata non truncata, densa, spiculis majoribus, glumis velutinis, flosculis sterilibus flosculum fertilem duplo superantibus, glumis longioribus et angustioribus, culmis robustioribus, basi raro ramosis.

3. ANTHOXANTHUM PUELLII Lecoq et Lamotte (Cat. pl. Auvergne p. 185):

Panicula spiciformi, parum laxiuscula, oblonga, apice attenuata, viridi; glumis lanceolatis, acutis, cuspidatis, glabrescentibus, inferiore uninervia, superiori duplo longiori, tenuissime punctulata, trinervia; flosculus sterilibus velutinis, flosculum fertile fere duplo superantibus, inferiori supra basin arista glumam superiorum tertia parte longiori, geniculata, eleganter striata, dimidio parte inferiori subcontorta armato; flosculo sterili superiori sub apice arista recta multo breviori instructo; flosculis fertilibus glabris, parvis, lucidis; foliis pallide viridibus, brevibus, planis, linearibus, acutis, glabris vel basi ciliatis; ligula oblonga, culmis valde gracilibus, basi ramosis; radice annua, fibrosa. — Culmis gracilioribus magisque ramosis, thyrso laxo, glumis glabriusculis ab *A. aristato* Boiss. discernitur, cujus forma typica inter *A. ovatum* Lag. et *A. Puellii* exacte intermedia est, quare hae 3 species annuae in unam verosimiliter jungendae (ut etiam voluerunt cell. Coss. et DR.) minime vero cum *A. odorato* associandae — DR. pl. Gérard, p. 26. — Gren. et Godr. Fl. Fr. III. p. 443. — Willk. et Lange Prodr. Fl. hisp. p. 38. Lange pugill. I. p. 27. *A. odoratum* β . laxiflorum St. Am. Flor. Agen. p. 13. — *A. odoratum* β . Puellii Coss. et DR. expl. Alger. p. 21. — *A. aristatum* Bor. Flor. centre 2. p. 576. Lloyd. Fl. orient. p. 505. (non Boiss.) *A. aristatum* β . laxum Lge ind. hafn. 1853. p. 2 exsicc. n. 19. — Puel et Maille herb. Flor. loc. n. 13, 35, 79. Bill. exsicc. n. 1578.

Hab. in ericetis, campis incultis et inter segetes Galliae, Hispaniae et Lusitaniae-pl. locis. — Formam praecocem pumilam ad la Albayda legit Lange, similisque in herbario Schousby pr. Trujillo Estremadurae lecta exstat.

Tribus III. PANICEAE Kunth. Gr. p. 40.

761. PASPALUM L.

(Walp. Ann. III. 712.)

v. Schlechtendal in Linn. XXVI. p. 256—284. Die Gattung Paspalum nach Steud. syn. et Kunth.

1. PASPALUM SCROBICULATUM Linn. — Hook. fl. Fl. Nov. Zeland. p. 291. — *P. orbiculatum* Forst. Prodr. A. Rich. Flor. A. Cunn. Prodr. — *P. venustum* Banks et Sol. Mss. Hab. Nova Zelandia. — Northern and Middle Islands: Banks et Soland.
2. PASPALUM DISTICHUM Burm. — Hook. fl. Fl. Nov. Zeland. pag. 291. — *P. vaginatum* Swartz Fl. Ind. Occ. — *P. littorale* Br. Prodr.; Trin. Ic. 10. t. 112. (Cfr. Steud. Synops. p. 20. n. 51.) Hab. Nova Zeland. Northern island; Bay of Islands, R. Cunningham; Auckland Sinclair etc.

3. *PASPALUS*(M) *GAYANUS*(M) Em. Desv. Gram. Chil. in Cl. Gay: Fl. chilena T. VI. p. 240. 1853.

P. natans, glaucus, totus glaber; culmis flaccidis, filiformibus; vaginis inferioribus aphyllis, internodiorum longitudine; foliis anguste linearibus, carinato plicatis; spicis geminis, saepe basi nudis; rachi plana, flexuosa, angusta; spiculis solitariis, sordide lutescentibus, ovato-ellipticis, obtusis, gluma inferiora nulla vel minima; superiore 4-nervia, glabra, nervis omnibus submarginalibus; palea sterili 5-nervia; palea floris fertilis inferiore 3-nervia, obtusa, apice parce breviterque pilosa. — In maritimis prope Serena Chili (Gay).

4. *PASPALUM CANESCENS* Ands. En. pl. in Ins. Galopag. in K. V. Acad. Handl. 1853. pag. 132.

Incano-hirtum, spicis 6—8 alternis, in racemum elongatum dispositis, rachi flexuosa, anguste marginata; pedicellis scaberrimis; spiculis geminis numerosis, ovato-orbiculatis, glaberrimis; culmo stricto, foliis linearibus utrinque molliter canovillosis.

Hab. in ins. Albemarle locis siccissimis elevatis (Ipse).

Radix fibris tenuissimis caet. Quaedam c. *P. longe pedunculato* communia habet secund. descript. Hookeri, recedit autem vaginis foliorum internodia culmi tegentibus, spicis multo longioribus, spiculis majoribus et magis numerosis, totis flavescens, nec gluma inferiore nigro-maculata.

762. MILIUM L.

(Walp. Ann. III. 713.)

1. *MILIUM VERTICILLATUM* Boiss. et Bal. pl. orient. Exsicc. n. 1330. (1857). et Bull. Soc. bot. de France 1858. p. 169.

Culmi 2—5 vel solitarii, recti, glabri, laeves, cylindrici, glaucescentes, 1—3 decimetr. Folia lineari-lanceolata, plana, glabra; ligula oblonga, integra, usque ad basin fissa. Panícula oblongo-lanceolata, pyramidalis, ramis sub anthesi rectis, post eandem patentes vel reflexi. Rami valde scabri, 5—20-flores verticillum fere completum 8—20-radiatum efficientes. Verticilli inferiores saepe steriles. Spiculae pedicellis suis 3—8ies breviores. Glumae glabrae laeves vel dorso scabrae inferior lanceolata, acuta, superiore ovali-oblonga, abrupte apiculata, paullo brevior, Paleae opae brunneae, glumis sublongiores et pilis brevibus adpressis obtectae, inferior 3-nervia, ovalis scariosa et apice rotundata, superior binervia, oblonga, superiore paullo brevior. Lodivulae 2, integrae, glabrae, oblongae, acutae. Stamina 3, antheris ovali-oblongis, filamenta fere aequantibus. Caryopsis ovali-oblonga apiculata, dorso modice compressa demum cum paleis persistens; styli 2 breves, stigmata plumosa. ☉, Juni. Juli.

Habit. in pratis regionis montanae. Alma Dagh et Mourad Dagh Phrygiae, fere 1200 metr. alt. Affinis *M. trichopodo* quocum tribum glumis opacis pilis paucis obsitum singularem format. Ex hoc *M. trichopodo*, *M. poaeforme* sp. nov. in Bul. pl. Orient. exsicc. n. 1331. (1857) non est diversum.

2. *MILIUM TRICHOPODUM* Boiss. — Boiss. diagn. XIII. p. 45.

M. annuum glabrum glaucescens, radice fibrosa, caulibus nanis, panícula fere radicali foliis aequilonga eorumque vaginis basi involuta ambitu ovata divaricatum effusissima, vaginis striatis subdilatis, ligula truncata glabra, limbo erecto anguste lanceolato-lineari, paniculae pedicellis setaceis rigidulis divergentibus laevibus spicula 3—4plo longioribus apice incrassatis, spiculis oblongis attenuatis, glumis oblongis acutis laevibus, glumellis glumae aequilongis sub len'e adpressissime et parce puberulis.

Hab. in palude exsiccata spongiosa herbida Antilibani inter Rascheya et Damascus, legi quoque in Antilibano supra Zehdani, in Mesopotamia inter Orfa et Suerek Kotschy No. 41.

Plantula bipollicaris caules 2—5 e radice edens, spiculae eis *M. vernatis* paulo minores. *M. vernale* M. B. differt praeterea caule elato, glumis scabris glumellas laeves glabras manifeste superantibus.

770. PANICUM L.

(Walp. Ann. III. p. 714.)

v. Schlechtend. in Linn. XXVI. Verz. d. Panic. Art. b. Kunth. u. Steudel.

Panici species foliis plicatis, in subgenus proprium collectae auctore A. Braun in append. ind. sem. hort. Berol. 1855.

In hortis botanicis recentiori tempore unicam tantum Panici speciem foliis plicatis divulgatam vidimus, Panicum scilicet plicatum Auct. s. palmifolium Poir., quom P. plicatum P. Lam., sub finem saeculi praeteritum in horto Parisiensi cultum, jam dudum evanuerit. Hodie aliam, eamque pulcherrimam et cultura dignissimam hujus sectionis speciem nuper e seminibus Brasilianis enatam *P. sulcatum* Aubl. offerre nobis licet. Inter reliquas quoque vasti generis species, quae foliis plicatis gaudent, complures statura et foliorum amplitudine non minus insignes sunt, quae, ut in hortos introducantur, valde optandum est, et inter quas *P. neurodes* Schult. cum varietatibus primum locum tenet. Species foliis plicatis omnes, quarum plurimas in herbario regio Berolinensi examinandi venio mihi erat, quamvis hucusque in variis sectionibus dispersae fuerint, in subgenus unum et proprium, ut sequitur, definiendum colligendas esse haud dubium mihi est.

PTYCHOPHYLLUM Al. Braun l. c.

(Subgenus Panici.)

Foliorum ligula brevis densissime ciliata; lamina aequilatera, basi sensim (in foliis inferioribus saepe in petiolum) attenuata, vernatione longitudinaliter conduplicata et secundum nervos angulo acutissimo e costa mediana progredientes profunde plicata. Panicula aut laxa et pyramidalis, aut condensata et in thyrsium spiciformem elongata, ramis simpliciter aut composite spiciformibus. Axis paniculae primaria, rami et praesertim ramuli inferiores apice plerumque in setam sterilem plus minusve elongatam abeuntes, spiculis pluribus intra setam terminalem alternatim dispositis, quibus antecedunt ramuli nonnulli setiformes spiculam unicam ad basin gerentes. Spiculae subsessiles vel breviter pedicellatae, teretiusculae vel a dorso compressae, glabrae, muticae. Gluma prima semper et multo, secunda plerumque spicula brevior, tertia (floris masculi vel neutrius) et quarta (floris hermaphroditi) inter se subaequales, aut quarta paulo brevior. Lodiculae truncatae. Stigmata plumosa, aut purpurea, aut albida.

Subgenus *Setariae* proximum. Setae aut elongatae eaque valde conspicuae, aut breves et parum conspicuae; in nonnullis rami nunc setigeri nunc spicula terminati; in una specie (*P. plicato* Lam.) rami primarii omnes spicula terminati, sed ramuli infimi in setam brevissimam abeuntes, ita ut in nulla specie setae omnino desint. Species omnes perennes esse videntur, aut caespitosae, aut repentes, pleraeque foliis late lanceolatis amplis insignes.

1. PANICUM PPLICATUM Lam. III. gen. I. (1791) p. 171. Enc. meth. IV. (1795) p. 736. — A. Br. l. c.

Perenne: culmo erecto debili; foliorum vaginis glabris, sub lamina pilorum annulo parum conspicuo cinctis lamina lanceolata, longe acuminata, supra pilis rarissimis

majoribus, subtus minoribus adpersa, demum denudata, margine et secus nervos utrinque scabra; panicula gracili elongata angusta, ramis remotis abbreviatis, simpliciter spiciformibus, in spiculam terminalem abeuntibus; spiculis confertiusculis, infimis ramulo setiformi spicula breviori lateraliter insidentibus; gluma prima spicula $\frac{2}{3}$ brevior, obtusiuscula, trinervi; secunda spicula $\frac{1}{3}$ brevior, acutiuscula, quinquenervi; tertia apice in mucronem convoluta, quinquenervi, glumellam depauperatam includente; quarta quam tertia vix brevior, acuminata, dorso eviderter punctato-rugulosa.

Sequente multo debilius. Folia in speciminibus visis 5—10" (sec. Lam. 9—15" longa, 5—7" lata, molliora, longius acuminata. Inflorescentiae rami 5—6" longi, spiculis inferiorum 10—11, superiorum sensim paucioribus, omnibus pedicellatis, pedicello dimidia fere spiculae longitudine. Stigmata purpurea.

Planta olim in horto Parisiensi culta originem ex insula Franciae duxisse dicitur vel opinione aliorum ex insula St. Domingo. Conf. Lam. Enc. I. c. (vidi specimen herbarii Læmærkiani, nunc Rœperiani, in horto Pær. 1790 lectum, et alterum in herbario Willdenowiano asservatum, a cl. Desfontaine datum).

2. PANICUM PALMIFOLIUM Poir. Enc. meth. Suppl. IV. (1816) p. 282. — Al. Br. I. c.

P. plicatum Roxb. in lit. ad Jacq. et Willd. 1806. Flor. Ind. or. I. (1820 et 1832) p. 311.

P. plicatum Willd. Enum. h. Ber. (1809) II. p. 1033.

P. plicatum Jacq. Ecl. Gram. (1813) t. I.

P. plicatum Schrank pl. rar. h. Mon. I. (1819) t. 19. — Trin. Sp. Gram. ic. ill. II. 1829 tom. 223.

P. asperatum Kunth En. (1833) p. 126.

Perenne; culmo erecto; foliorum vaginis pilis patentibus plus minusve hirsutis, ore pilis longioribus patentissimis ciliatis et dorso sub lamina pilorum erectorum cingulo instructis; lamina late lanceolata, brevius acuminata, utrinque aequaliter pilosa, margine et subtus ad nervos scabriuscula; panicula erecta, pyramidali, laxa, ramis strictis demum patentissimis compositae spiciformibus, ramulis brevibus spiculisque adpressis; rachi piloso-scabra, apice, ramis ramulisque nunc spicula terminatis, nunc in setam spiculas vix superantem abeuntibus; spiculis minus confertis; gluma prima spicula $\frac{2}{3}$, rarius dimidio brevior, obtusa vel acutiuscula, quinquenervi; gluma secunda spicula vix $\frac{1}{2}$ brevior, apiculata, septemnervi; tertia apice in mucronem brevem convoluta, quinquenervi, glumellam depauperatam includente; quarta longitudine fere tertiae, brevissime apiculata, tenuissime punctato-rugulosa.

Folia 1—1 $\frac{1}{2}$ " longa, 1 $\frac{1}{2}$ —25" lata. Panicula 6—9" longa, basi ramis expansis 2—4" lata, ramis inferioribus 1—2" longis. Spiculae in ramulis 7 et sensim pauciores, superiores subsessiles, inferiores pedicello spicula quadruplo breviori insidentes, pallide virescentes, rarius violascentes, 3mm. fere longae. Stigmata purpurea. Setae praesertim in speciminibus maerioribus observandae.

Planta e Sumatra in hortum botanicum Calcuttae introducta a Roxburghio ad Jacquinum et Willdenowium anno 1806 missa est, ex quo tempore in hortos Europaeos divulgata est. Vidi specimen Roxburghianum ex horto Calcuttensi in herb. Willdenowiano, quod a planta hortensi nostra specie non differt. Specimina spontanea nullibi in herbariis prostant et icones citatae omnes ad plantam hortensem exhibitae sunt.

3. PANICUM NEURODES Schult. Mant. II. (1824) p. 228.

P. nervosum Roxb. Fl. ind. I. (1820 et 1832) p. 314 et 311. — Al. Br. I. c.

P. nepalense Spreng. Syst. I. (1825) p. 321. Kunth Enum. p. 94. Steud. Syn. p. 49.

P. Kleinianum Nees herb.

Perenne; culmo erecto; foliorum vaginis elongatis, verrucoso-strigosis, demum denudatis, ore barbatis, pilorum cingulo dorsali ad originem laminae nullo aut incompleto; lamina lanceolata, supra pilis setiformibus longioribus raris, subtus pilis minoribus crebrioribus vestita, vel denudata, utrinque ad nervos aspera; panicula recta (aut apice cernua), laxa, ramis elongatis demum patulis composite et interrupte spiciformibus; ramulis spiculisque subadpressis; rachi scabra, apice, ramis, ramulisque in setam spiculis (plerumque) longiorem abeuntibus; spiculis laxè alternis; gluma prima spicula $\frac{1}{4}$ — $\frac{1}{2}$ brevior, obtusa vel acutiuscula, 3—5-nervi; secunda spicula $\frac{1}{2}$ — $\frac{1}{4}$ brevior, acutiuscula, 5—7-nervi, tertia apice in mucronem plus minusve elongatum convoluta, 5-nervi, glumellam depauperatam includente; quarta tertiam longitudine aequante vel brevior, apiculata, longitudinaliter subtilissime striata et transversaliter punctato-rugulosa.

A praecedente differt vaginarum pilis rigidioribus, plerumque adpressis, verrucis evidentioribus insidentibus; pilis in superficie laminae, ubi adsunt, longioribus, setiformibus; paniculae ramis longioribus et magis interruptis, saepe, filiformibus; ramis ramulisque constanter in setas (longiores) abeuntibus; spiculis plerumque magis acuminatis; stigmatibus, ut videtur, albidis. Caeterum quam maxime polymorphum est, culmo debiliore vel crassiore, foliis angustioribus vel latioribus, panicula macra et pauciramea vel speciosa et multiramea, spiculis majoribus vel minoribus, denique pubescentia partium, setarum longitudine, glumarum longitudine relativa et nervorum numero varians. Varietas *Kleiniana* et *Roxburghiana* genuinum *P. nervodes* sistunt. *P. amplissimum* et *lene* Steudeli characterè essentiali distinguere nequeo; his accedit var. *Thwaitesii*, quae pubescentia insignis est. Forte ad hanc speciem, per Indiam orientalem late divulgatam, etiam *P. palmaefolium* König e regno Siamensi spectat (Naturforsch. 23. Stück, 1789, p. 201). Varietates mihi sunt:

α . *conjungens*, foliorum vaginis subnudis; lamina late lanceolata, utrinque nuda; panicula latius pyramidata, abbreviata, ramis patentissimis rigidioribus; setis spicula vix paulo tantum longioribus; spiculis latioribus pallidis; gluma prima spicula $\frac{1}{4}$ — $\frac{2}{3}$ brevior, trinervi; secunda spicula dimidio brevior, 5-nervi; quarta tertiam aequante vel paululum superante, subtilissime striata et punctata, vix transverse rugulosa.

Habitu et inflorescentia proxime accedit ad *P. palmifolium*.

In Nepalia (Royle No. 27. in herb. Nees ab E. sub *P. Kleiniano* a).

β . *Kleinianum* (*P. Kleinianum* α Nees, herb.), vaginis subnudis; lamina angustius lanceolata (6—10'' lata) superne parcissime setulosa, inferne tenuissime pilosa, demum denudata; panicula elongata, pauciramea, laxissima, ramis strictis; setis spicula duplo vel triplo longioribus; spiculis angustioribus pallidis; gluma prima spicula $\frac{2}{3}$ brevior, 5-nervi; secunda spicula $\frac{1}{3}$ brevior, 7-nervi; quarta tertiam aequante, evidentius rugulosa.

In peninsula Indiae orientalis (Wight No. 26); prope Courtallum (No. 1029); in Malabarìa (No. 1617).

γ . *blepharoneuron*, culmo debili; foliis minoribus; vaginis parcissime strigosis, demum denudatis; lamina anguste lanceolata (5—6'' lata), supra setulis majoribus secus nervos regulariter seriatis munita, subtus nuda; panicula macra, minus interrupta et minus expansa, ramis valde flexuosis; setis spicula quadruplo ad quintuplo longioribus; spiculis saepe coloratis paulo minoribus, gluma prima spicula $\frac{2}{3}$ brevior, 3—5-nervi; secunda $\frac{1}{3}$ brevior, 7-nervi; quarta tertiam aequante, evidentius rugulosa.

In Nepalia ubique et per totum annum vigens (Wallich No. 8703.)

δ . *Roxburghianum*. (*P. Kleinianum* β . Nees herb.); culmo altiore et robusto; foliis amphioribus; vaginis parce strigosis, demum denudatis; lamina latius lanceolata (14—18'' lata), superne parce setulosa, inferne tenuissime pilosa; panicula speciosa: $1\frac{1}{2}$ ' et ultra longa), multi- et longi-ramea, erecta, ramis inferioribus filiformibus

saepe arcuatim-pendulis; setis spicula duplo triplove longioribus, spiculis minoribus (3mm, fere longis) subfufcescentibus; gluma prima spicula $\frac{2}{3}$ brevior, 3-nervi; secunda $\frac{1}{3}$ brevior, 5-nervi; quarta tertiam aequante.

In Nepalia (Wallich Nr. 8702. in herb. Nees ab E.), prope Courtallum (Nr. 1014. et in Bengalica prope Sillet (No. 8702 in herb. Kunth).

ε. *amplissimum* (P. amplissimum Steud. Syn. p. 54; P. Kleinianum Nees in Hook. Journ. of Bot. 1850), altissimum; foliis amplis; vaginis insigniter tuberculatis, strigosis; lamina late lanceolata (12—25" lata), omnino denudata; panicula speciosissima (ad 2' longa), multi- et longi-ramea, erecta; setis spicula duplo triplove longioribus; spiculis minoribus (3 mm. longis) subfufcescentibus; gluma prima spicula $\frac{2}{3}$ ad $\frac{1}{2}$ brevior, 3-nervi (perraro 5-nervi); secunda $\frac{1}{4}$ brevior, plerumque 6-nervi; tertia longius mucronata, quartam superante.

In insulis Philippinis (Cuming No. 553.)

ζ. *lene* (P. lene Steud. Syn. p. 54), statura, colore, foliorum amplitudine, vaginis inflorescentia et glumarum longitudine cum praecedente convenit, a quo differt lamina subtus tenuissime pilosa, gluma 3—5-nervi, secunda septemnervi.

In insula Java (Zollinger No. 815.)

η. *Thwaitesii*, culmo elato et robusto; foliis amplis; vaginis insigniter verrucosis et strigosis, nec non passim minutissime pulverulento-adsersis; lamina late lanceolata (11—13" lata), supra setulosa, subtus dense pilosa; panicula speciosa, apice nutante, ramis inferioribus valde elongatis pendulis; rachi aspera et parce pilosa; setis spicula brevioribus vel vix longioribus; spiculis majoribus (4mm. longis), ad glumas steriles pubescentia tenuissima e pilis microscopicis crispatis contortis vestitis; gluma prima spicula vix $\frac{2}{3}$ brevior, 5-nervi; secunda $\frac{1}{4}$ brevior, 7-nervi; tertia longius mucronata, quartam superante.

In insula Ceylon (Thwaites).

4. PANICUM COSTATUM Roxb. Fl. ind. I. (1820 et 1832) p. 315 et 312. — Steud. Syn. p. 64. — Al. Br. l. c. — *P. Thouarsianum* Nees in Steud. Syn. p. 62:

Perenne, culmo e basi longe repente et radicante ascendente, ramoso ($1\frac{1}{2}$ — $2\frac{1}{2}$ " supra terram elato); foliorum vaginis internodio multo brevioribus, inferioribus et tuberculis piliferis, superioribus nudis, margine piloso fimbriatis, cingulo pilorum dorsali carentibus; lamina late lanceolata (5—8" lata), longe acuminata, utrinque secus nervos pilis longioribus laxè seriatis versus marginem directis, subtus praeterea pilis inconspicuis sparsis munita, margine et ad nervos scabra, prope basin ciliis nonnullis longioribus instructa; panicula thysiformi, recta, ramis dense spiciformibus (pollice brevioribus) erecto-patentibus; rachi scabra et parce pilosa; ramis in setam brevissimam, ramulis in longiorem spiculas duplo vel triplo superantem abeuntibus; spiculis subunilateraliter confertis, oblongis; gluma prima spicula $\frac{2}{3}$ brevior, trinervi; secunda spicula $\frac{1}{3}$ brevior, 7-nervi; tertia 7-nervia, glumellam ejusdem longitudinis et florem masculum includente; quarta longitudine fere tertiae, apiculata, dorso transverse rugosa.

Species a praecedentibus valde distincta, habitu peculiari gaudens. Folia tenuiora et breviora, vagina plerumque 2—4", lamina 4—8' longa. Inflorescentia fere Echinochloae, sed spicae laterales undique versae et densius confertae. Spiculae $2\frac{1}{2}$ mm longae. Rugae transversales glumae quartae saepius gluma secunda eam tegente imitantur.

Habitat in insula Mauritiis, unde 1802 in horium Calcuttensem introductum est. Vidi specimen Wallichianum ex horto bot. Calcutt. sub No. 8689 missum, et specimen Thouarsianum sine dubio in ins. Maur. lectam in herb. Willdenowiano. Asservantur insuper in herb. reg. Berol. specimina in insula Ceylon lecta, ubi hanc speciem introductam esse suspicor.

5. PANICUM CHAMAERAPHIS Nees Mspt. (non Trin., quod est Chamaeraphis hordeacea R. Br.) — Al. B. l. c. — *P. homonymum* Steud. Syn. p. 48. —

Perenne? culmo erecto, humili et gracili; foliorum vaginis margine barbatis, caeterum nudiusculis; lamina lanceolata, longe acuminata, utrinque secus nervos pilis longioribus laxè seriatis munita, margine et ad nervos scabriuscula et prope basin ciliis nonnullis longioribus instructa; panicula elongata, laxa, erecta, ramis gracilibus, simpliciter spiciformibus, apice in setam abeuntibus; spiculis laxè alternantibus secundis, inferioribus singulatim ad basin ramuli setiformis ramuli duplo vel triplo superantis collocatis; rachi primaria et secundaria, nec non setorum basi pilis longis patulis ciliata; spiculis a dorso valde compressis, ovalibus, obtusissimis ($2\frac{1}{2}$ mm. longis); gluma prima spicula $\frac{2}{3}$ et ultra brevior, obtusissima, trinervi; secunda spiculam fere aequante, obtusa, 5—6-nervi; tertia obtusiuscula, apice paululum inflexa, 5-nervi, glumellam depauperatam includente; quarta tertiam aequante, vix apiculata, transverse rugosa.

Species valde singularis, respectu reliquorum subgeneris specierum nana, pedalis aut vix altior, forsàn annua, caespitulos multicaules formans. Foliorum lamina longitudinalè 3—5" vix excedens, 4—5" lata, quoad pubescentiam cum *Panico* costato conveniens. Inflorescentia quam in reliquis multo simplicior, maxime regularis. Stigmata purpurea.

In Nepalia (Royle Nr. 47).

6. *PANICUM FORBESIANUM* Nees in Steud. Syn. p. 98:

Perenne; culmo stricto; foliorum vaginis elongatis, margine barbatis; lamina lineari-lanceolata elongata, ad basin pilis longis barbata, caeterum denudata, margine et ad nervos scabra; panicula elongata, angusta, stricta, ramis erectiusculis simpliciter spiciformibus (vel basi subdivisis), in setam elongatam abeuntibus; spiculis laxissime alternantibus, inferioribus singulatim ad basin setae spiculam duplo triplo superantis collocatis; rachi inferne brevissime pilosa, superne scabra; spiculis ovalibus, apice attenuatis acutiusculis, parum compressis; gluma prima spiculam dimidiam aequante eamque basi dilatata amplectente, acutiuscula, 5-nervi; secunda spicula paululum brevior, latissime ovata, obtusa, 9-nervi; tertia breviter acuminata, 7-nervi, glumellam paulo brevior et florum masculinum includente; quarta tertiam aequante, utrinque attenuata, longitudinaliter striolata et transverse obsolete rugulosa.

Inflorescentiae simplicitate ad priorem speciem accedit, sed culmus altior, 3-pedalis; folia valde elongata, angusta, ultra pedem longa, 5—7" lata. Panicula in specimine examinato 10" longa, ramis vix pollicem longis, spiculas ut plurimum 8—9 gerentibus.

In Nepalia (Royle No. 31.)

7. *PANICUM SULCATUM* Aubl. Guian. I. (1775.) p. 50. — Lam. Enc. IV. (1795) p. 746.

Nees ab E. in Mart. Fl. Bras. II, p. 253. (ex parte). — Al. Br. l. c.

Perenne; culmo erecto, elato; foliorum vaginis hirsutis, ore longe barbatis et dorso sub lamina pilorum annulo adpresso cinctis; lamina amplissima, late lanceolata, breviter acuminata, supra nuda et glabra, subtus pilis minutissimis adpressis et vix conspicuis parce adpersa, ad nervos, aequè ac margine, scabriuscula; panicula thyrsoidè fusiformi vel subcylindrico-elongata, basi interrupta, superne condensata, cernua, ramis brevibus (pollicariis, infimis nonnunquam magis elongatis), erecto-patentibus, e basi composita superne spiciformibus, ramulis spiculisque confertis unilateralibus; rachi superne breviter pilosa, ramorum scabra; setis in apice ramorum et ramulorum spicula triplo ad quintuplo longioribus; spiculis oblongo-lanceolatis; gluma prima spicula $\frac{2}{3}$ brevior, obtusa, 3-nervi, nervis marginem hyalinum non attingentibus; secunda $\frac{1}{3}$ brevior, acutiuscula, 5-nervi; tertia acuminata, 5-nervi, glumellam depauperatam includente; quarta tertiam fere attingente, sensim acutata, subtiliter transverse punctato-rugulosa.

Omnium speciosissimum! Culmus 5—6' altus; foliorum lamina latissima, inferiorum $1\frac{1}{2}$ ' longa; 24—36" lata, basi in petiolum anguste marginatum sensim attenuata; inflorescentia in speciminibus cultis 1—1 $\frac{1}{2}$ ' longa, in specimine spontaneo

Sellowiano 2½' longa; setae numerosae et valde conspicuae; spiculae 2½—3mm. longae, ¼mm. latae, virides. Gluma floris hermaphroditi albida, nitens. Stigmata alba.

In Martinica sec. Plumier (*Milium latifolium sulcatum* Plum. Mspt. s. *Milium arundinaceum latifolium foliis liratis* Plum. Cat. 1703. p. 10); in Guiana sec. Aublet; in Brasilia meridionali prope Yriro (Sellow in herb. reg. Berol.); in insula St. Catharina, unde semina misit Dr. Blumenau, e quibus Martio 1854 in horto satis plantae enatae sunt speciosissimae, quae sero autumno 1855 primum florebant.

8. PANICUM CRUS ARDEAE Willd. herb. — Nees ab E. in Mart. Fl. Bras. II. (1829.) p. 253; — Steud. Syn. p. 54. — Alex. Br. ind. h. Berol. 55.

Setaria Crus Ardeae Kunth. Enum. p. 155.

? *Panicum elongatum* Poir. Encycl. Suppl. IV. (1816) p. 278. (non Pursh).

? *P. Poiretianum* Schult. Mant. II. (1824) p. 229.

? *Setaria Poiretiana* Kunth. Enum. p. 155.

? *Panicum sulcatum* Bertol. Excerpt. (1820). p. 14; Opusc. scient. 4. p. 230.

? *Setaria sulcata* Raddi Agrost. Bras. (1823) p. 50; — Schult. Mant. II. p. 278.

Perenne; culmo erecto, elato; foliorum vaginis subnudis, ore vix barbatis, dorso sub lamina pilorum annulo adpresso cinctis; lamina angustius lanceolata, supra nuda et glabriuscula, subtus pilis minimis adpersa vel subnuda, ad nervos, aequae ac marginae, scabra; panícula thyrsoidea, angusta et valde elongata, satis laxa et basi saepe interrupta, ramis brevibus (pollicaribus), suberectis, e basi composita superne spiciformibus, ramulis spiculisque minus confertis unilateralibus; rachi scabra; setis in apice ramorum et ramulorum spicalam duplo ad sextuplo superantibus; spiculis ovato-oblongis, subacuminatis; gluma prima spicula ⅔ brevior, obtusa, 3—5-nervi, nervo medio marginem anguste hyalinum attingente; secunda spicula ½—⅓ brevior, subapiculata, 5—7-nervi; tertia apice convoluta-mucronata, 5-nervi, glumellam perfectam includente; quarta tertiam fere aequante, acuminata, obsolete punctato-rugulosa.

α. *longisetum*, setis spicula quadruplo ad sextuplo longioribus; gluma prima plerumque 5-nervi, secunda 7-nervi.

β. *brevisetum*, setis spicula duplo triplo longioribus; gluma prima plerumque 3-nervi, secunda 5-nervi.

Species praecedenti affinis. Culmus 3½—5' attingere videtur, in specimine Sellowiano basi geniculatus et decumbens, e nodis radicans, in specimine guianensi inde a basi erectus. Foliorum lamina in speciminibus examinatis 8—14" lata. Inflorescentia 1—1½' longa, 1" lata. Spiculae 3½—4 mm. longae, ¼—1½ mm. latae, altero latere valde convexae, altero planae, aviculae caput fere aemulantes. Gluma floris hermaphroditi subfusca, nitida.

Cl. Nees varietatem longisetam hujus speciei cum *P. sulcato* comiscuit, ut e descriptione hujus in Flora Bras. elucet. *P. sulcatum* Bertolonii (*Setaria sulcata* Raddi) quoque e descriptione potius ad *P. Crus Ardeae* pertinere videtur, aequae ac *P. elongatum* Poir., quod vix recte cum *P. specioso* Nees conjunctum esse mihi videtur.

In America meridionali primus invenit Humboldt (vidi specimen mancum var. β. in herb. Willdenowiano); in Brasilia cum praecedente specie varietatem α. legit Sellow (herb. reg. Berol.); prope Rio de Janeiro a Raddio indicatur; specimen var. α. ibidem a cl. Ackermann (olim consule Badensi in Brasilia) lectum ipse possideo. E. Guiana gallica denique var. β. e Museo Paris. sub No. 62. communicatam vidi.

9. PANICUM SPECIOSUM Nees ab E. in Mart. Fl. Bras. II. (1829) p. 252. — Al. Br. I. c.

Perenne; culmo erecto, elato; foliorum vaginis nudis vel breviter setulosis, marginae ciliatis, ore breviter barbatis et dorso sub lamina pilorum annulo adpresso cinctis; lamina late lanceolata, acuminata, utrinque nuda vel subtus breviter pilosa.

supra glabra, subtus ad nervos marginèque scabriuscula; panicula dense thyrsoidæ angusta et valde elongata, erecta, ramis brevibus (vix pollicaribus), plus minusve patulis, e basi composita superne spiciformibus, ramulis spiculisque confertis unilateribus; rachi scabra; setis in apice ramorum et ramulorum spicula duplo ad quadruplo longioribus; spiculis oblongo-lanceolatis, acuminatis; gluma prima spicula $\frac{2}{3}$ — $\frac{1}{2}$ brevior, obtusa vel acutiuscula, 3—5-nervi; secunda spicula vix $\frac{1}{3}$ brevior, acuta, 5—7-nervi; tertia acuminata, 5-nervi, glumellam evolutam includente; quarta tertiam æquante vel paulo brevior, acuminata, transverse punctulato-rugulosa.

Ab affini *P. sulcato* præsertim differt culmo strictiore et, ut videtur, humiliore; vaginis plerumque nudis; inflorescentia e vagina folii supremi breviter exserta vel basi occulta, omnino erecta, magis cylindrico-elongata; spiculis longioribus, gluma prima et secunda ratione spiculæ longioribus, glumella in axilla glumæ tertiæ perfecte evoluta glumam longitudine æquante, gluma quarta longius acuminata. Caeterum vix minus speciosum. Folia ampla, lamina 1— $1\frac{1}{2}$ longa; 16—26" lata, basi in petiolum marginatum attenuata. Inflorescentia $1\frac{1}{2}$ —2' longa, pollicem vel paulo ultra lata. Spiculæ teretiuseculæ, subfuscae, nitidæ, 4—5mm. longæ, vix $1\frac{1}{2}$ mm. latæ. Stigmata albida. Secundum specimina in herbario reg. Berol. asservata varietates tres distinguendæ esse videntur:

α . *Martianum* (*P. speciosum* Nees I. c.), foliorum lamina brevius acuminata, utrinque nuda; paniculæ ramis divaricatis, spiculis deorsum flexis; setis spicula subquadruplo longioribus; gluma prima acutiuscula, 5-nervi; secunda 7—8-nervi, quarta tertiam longitudine fere æquante.

β . *Pöppigii*, foliorum lamina longius acuminata, subtus pilosa; paniculæ ramis erecto-patentibus, spiculis non deflexis; setis brevioribus, spicula vix triplo longioribus; gluma prima obtusissima trinervi; secunda 5-nervi, quarta tertiam æquante.

γ . *larum*, foliorum lamina longius acuminata, utrinquè nuda; paniculæ laxioris et inferne magis interruptæ ramis erectioribus, spiculis non deflexis; setis spicula triplo ad quadruplo longioribus; gluma prima obtusiuscula, 5-nervi; secunda 7-nervi; quarta quam tertia paulo brevior.

Var. α . in Brasiliæ provincia Para legit Martius; var. β . et γ . ad fluvium Amazonum cl. Pöppig (No. 3056 et 2251).

10. PANICUM CERNUUM Willd. herb. Spreng. Syst. I. (1825) p. 318; Nees in Mart. Fl. Bras. p. 253; Steud. Syn. p. 53. — Al. Br. I. c.

Setaria cernua H. B. et K. Nov. gen. I. (1815) p. 111; Kunth Enum. I. p. 155.

Perenne; culmo erecto; foliorum vaginis ore pilosis, caeterum nudis, pilorum cingulo dorsali destitutis; lamina lineari, dura, supra sparse pilosa, dorso nuda et glabra; panicula in thyrsum spiciformem cylindrico-elongatum contracta, cernua, ramis densissime congestis brevibus inferne compositis, apice ramulisque seta tenui spicula duplo longiore terminatis; rachi pilosa; spiculis confertis, omnibus pedicellatis, oblongis, acutis; gluma prima dimidiam spiculam superante, spiculam basi amplectente, acuta, 3-nervi; secunda spiculam fere æquante, mucronulata, 5- (varius 7-) nervi; tertia secundæ simili, 5-nervi, glumellam perfectam et florem masculum includente; quarta præcedentibus duabus multo brevior, obtusa et vix mucronulata, transverse rugulosa.

De hac specie, cum præcedentibus inflorescentiæ indole conjuncta, in reliquis vero distinctissima, valde dubius sum, utrum revera ad *Ptychophylli* subgenus pertineat. Folia inferiora in specimine herbarii Willdenowiani æque ac Kunthiani desunt, superiora, quæ præstant, plicis nonnullis parallelis, minus regularibus, nescio an fortuito, percurta sunt. Foliis gaudet quam in reliquis *Ptychophylli* speciebus multo durioribus, lamina lineari, basi parum contracta, tres lines latitudine vix superante instructa. Nervi, quæ in reliquis *Ptychophyllis* oblique a costa mediana excurrunt, in hac specie costæ mediæ (satis distinctæ) paralleli, in pagina superiore magis quam in inferiore prominuli. Scabrities in nervis nulla, in margine denticuli minutissimi, imo sub lente vix conspicui. Inflorescentia 3—6" longa, $\frac{1}{2}$ — $\frac{2}{3}$ " crassa, Alo-

pecuri spicam fere aemulans. Setae quam in aliis plerisque speciebus minus conspicuae, tenues, flexosae. Infra setam rami terminalem spiculae inveniuntur solitariae circiter 3, quibus praecedunt totidem ad basin pedicelli spicula altera brevius pedicellata auctae, porro ramuli ipsi in setam abeuntes spiculasque 2, 3 vel plures gerentes; ramuli setigeri spiculam unicam gerentes omnino deesse videntur. Pedis celli spicula nunc paulo breviores, nunc duplo fere longiores. Spiculae 3 mm. fere longae, 1 mm. latae, pallidae, albescens.

In montanis regni Quitensis ad flumen Guallabamba legit Humboldt.

Praeter species enumeratas ad *Ptychophylli* subgenus forte spectant:

- 1) *P. megaphyllum* Steud. Syn. p. 53.
- 2) *P. flabellatum* Steud. ibid. p. 53.
- 3) *P. paniculiferum* Steud. ibid. p. 54.
- 4) *P. racemiferum* Steud. ibid. p. 64.
- 5) *P. plicatile* Hochst. Flor. 1855. p. 198.

11. PANICUM (ECHINOCHLOA) ORYZINUM Gmel. Syst. 1. 157. (1793). — Al. Br. in Ind. sem. h. b. Berol. 1851.

P. Hostii M. B. (1819).

P. stagninum Host.

Echinochloa commutata Schult. Mant.

Oplismenus Crus galli β Kunth. Enum.

A *Panicum Crus galli* differt culmis semper erectis, paniculae ramis sub anthesi minus patulis, superioribus sensim brevioribus in spicam terminalem brevioribus minus conspicuam abeuntibus, imprimis autem palea inferiore floris sterilis 5-nervia (non 7-nervia) nervis scilicet inter medianum et binos margini approximatos evanescentibus. Specimina culta, spontaneis Sieberianis ex oryzetis Aegypti caeterum similia, spiculas proferunt haud raro trifloras i. e. flore neutro et duobus hermaphroditis praeditas (*Panicum mirabile* A. Br. in hort. Carlsr. 1845). Semina sub diu rarius maturat, hinc in tepidario colendum.

12. PANICUM BREVIFOLIUM L. β . *filamentosum* Pers. Schlecht. Linnaea, 6. p. 34. — *P. guayaquilense* Steud. Synop. p. 85.

Status juvenilis, inde spiculis minoribus. Non differt a forma α (ad quam pertinet *P. trichoides* Sw. et *P. trichoptum* Steud. Synops. p. 85.) nisi vaginis pilosis et paniculae ramis strictioribus.

Griesebach, Bonplandia 1858. p. 11.

Hab. in isthmo Panamensi.

Hab. in Nova Zelandia, Northern Island, in sylvis et umbrosis vulgaris.

18. PANICUM ANTIPODUM Spr. Steud. — *Isachne australis* Br. Hook. fil. Fl. Nov. Zeland. p. 291.

Hab. in Nova Zeland. Northern Island, Bay of Island. Cunningham etc.; Auckland, Sinclair.

16. PANICUM HIRTICAULON Presl. (Reliq. Haenkeanu. I. p. 308). Anders. l. c. p. 134. et 43. — Knth. Agr. p. 161.

variat: *majus*; culmo bipedali, subsimplici, pennae anserinae crassitie, f. latis, panicula ramosissima, ap. 2—4 uncias lata. — In insula Indefatigable, — *minus*: culmo vix pedali a b. ramosissimo, tenui, f. vix semiunciam latis, vaginis multo densius et scabrius strigosis, panicula anguste contracta, subrara, spiculis laetius viridibus b. flavescens.

Hab. in insula Chatham et Charles.

glabrescens: vaginis pilis tantum paucis derelictis glabriusculis, f. obscuris coloratis, spiculis (in duabus praecedentibus formis mox caducis) diutius persistentibus et paniculam densiorem efficientibus.

In ins. Chatham.

17. PANICUM MULTICULMUM Ands. En. pl. in ins. Galopag., in K. V. Acad. Handl. 1853 p. 133. et in Engenies Rese 1851—53 p. 43.

Culmis caespitosis, valde ramosis, ascendentib. pubescentibus; f. brevib., planiusculis, incano-villosis, vaginis subdilatis: panicula obliqua condensata, rhachi ramisque pilosis; spiculis ovatis acutiusculis; gluma inferiori brevi acuta, superiori flosculum aequante 7-nervosa; flosculo neutro bipaleaceo hermaphrodito osseo, paleis rugosis. —

Hab. ad scaturigines regionis mediae insulae Charles (Ipse).

18. PANICUM FUSCUM Sw. H. Ind. J. 145. Knth. Agr. p. 94). Anders. l. c. p. 135. et in Engenies Rese p. 41.

Sub triplici occurrit forma:

vegetus: pallide virens, culmo b. ascendente, diffuse ramosissimo 1—2 pedali; ramis paniculae pyramidalis angulatis divaricatis; spiculis pallide ferrugineis.

firmus: obscure viridis, culmo pedali rigido, ramis et foliis strictissimis; ramis paniculae elongatae subadpressis; spiculis fusco-sanguineis. —

pubescens: foliis vaginisq. longe pilosis.

Hab. locis graminosis reg. inf. et mediae ins. Chatham et Charles. (Ipse).

19. PANICUM PARVUM (Sect. I. spicato-paniculata) Buse.

Buse in pl. Jungh. III. p. 373.

Paniculae ram. paucis, tenuib.; spiculis laxe sed subseriatim dispositis, inaequaliter pedicellatis, ellipticis, glabris, gluma infera lata membranacea, supera et glumella floris hebetati infera fertilem aequantib., hujus glumella infera apiculata rugulosa; f. linearib., glabris, margine scabris, vaginis margine tantum pilosis, culmo debili. —

Hab. ins. Javae pr. Weltevreden v. d. Bosch in herb. clar. de Vriese. —

Affine P. prostrato et P. umbroso Retz.

20. PANICUM MYRIANTHUM (Sect. III. Paniculata) Buse.

Buse in pl. Jungh. III. p. 374.

Paniculae anguste ovalis elongatae rhachi ramisque hirsutis, ramis iterum sed brevius ramulosis, ramulis capillarib., spiculis ovoideis, gluma infera ovata spiculae $\frac{1}{2}$ superante, supera spiculam aequante, floris neutrius glumella infera longa, supera brevi, floris fertilib. glumell. laevib. nitidis, inferae figura ovata acuta, f. lanc. pag. superiore et vaginis parce pilosa, vaginis ore hispidiusculis. —

Hab. ins. Javae Zoll. no. 338 in herb. Acad. Lugd. Bat. Affine P. incompto Trin. —

21. PANICUM CAMPYLOGRAMMUM (sect. paniculata) Buse.

Buse in pl. Jungh. III. p. 375.

Paniculae ovato-pyramidatae ramis ramulisq. valde flexuosis pilis sparsis obsitis, spiculis ellipticis coloratis, gluma infera spiculae $\frac{1}{2}$ superante, supera spiculam ae-

quante, fol. lanc. planis supra pilosis subt. mollit. pubescentib., vaginis amplis pilosellis, culmo ramoso hic illic piloso. —

Hab. in Sumatrae dumeta pr. Padang. (Jungh). Planta speciosa 10-ped. —

22. PANICUM PULIPES (Sect. IV.) Nees et W. Arn. mss. Buse.

Buse in pl. Jungh. III. p. 376.

Paniculae parvae rhomboidalis ramis paucis, alternis remotis, crassis, hic illic praesertim b. pilis sparsis obsitis; spiculis breve pedicellatis, coloratis, ambitu semi-rhombicis; gluma infera spiculae $\frac{2}{3}$, supera $\frac{3}{4}$ spiculae aequante; fl. neutrius glumella infera magna, fertilis glumellis nitidis laevissimis; foliis utrinq. subglabris, vaginis ore setosis; culmo ramoso, b. prostrata radicante, —

Hab. ins. Javae silvas in sinu Wijnkoopshaai. (Jungh.)

23. PANICUM JAVANUM (Sect. V.) Nees mss. Buse.

Buse in pl. Jungh. III. p. 376.

Paniculae lanceolatae subcontractae ram. lgis., tenuib., scabris; spiculis modice pedicellatis, lanc., acutis; gluma inf. late ovata acuta, spicula vix $\frac{1}{2}$ aequante, supera ut ex neutrius floris glumella infera spiculam aequante, huj. glumella supera sub nulla, fl. fertilis glumellis parum induratis: f. lanc. e. b. cordata, glabrescentib., supremo paniculae basin cingente, vaginis ore setosis. —

Hab. ins. Javae pr. Weltevreden et Buitenzorg. (Jungh.)

3—4 ped., etc.

β. *angustifolium*: f. linearib., caetera ut in specie. — Java pr. Pesewahan. (Jungh.)

24. PANICUM CORDATUM (Sectio VI.) Buse.

Buse in pl. Jungh. III. p. 376.

Paniculae contractae, defloratae vero divaricatae ramis non multis, spiculis lge. pedicellatis, ovalib. glabris; glumis subaequalib.; fl. sterilis glumella infera magna supera nulla; fl. fertilis glumellis nitidis, laevissimis, f. cordato-lanc., latis subglabris margine scabris atque ciliatis, vaginis parce setosis; culmo erecto, ramoso, geniculis prominulis.

Hab. ins. Javae pr. Pesawahan. (Jungh.)

25. PANICUM DICTYONEURUM Figari et de Notar. in Acad. Tor. 1851. tab. VIII. fig. 1—15.

Deest in speciminibus nostris Caryopsis et tota pars culmi a radice ad nodum superiorem, sed ex parte plantae superiore, a b. vaginae folii supremi nempe ad paniculae ap., quae decimetra 7 metitur, culmus orgyalem altitudinem in hac specie excedere facile eruitur. Species caeterum spectabilis et optime distincta, tum paniculae et locustarum amplitudine, c. valvula superiore inferiore angustiore ut palea inferiore flosculi masculi reticulata. —

Vide I. c. plantae descr. ampl.

In regione Kordofan Nubiae superior.

26. PANICUM JUBATUM Figari et de Notaris in Acad. Tor. 1854. tab. IX. fig. 1—15.

Valvulis paleisque structura ad P. dictyoneurum accedit, sed pluribus momentibus distinctissimum, ut vix cum ea comparari mereatur. —

Vide I. c. plantae descr. amplissimam.

In regione Kordofan Nubiae superioris.

27. PANICUM OLIGOTRICHUM Fig. et de Notaris in Acta Torin. 1854. p. 333. tab. X. 1—14.

In sect. quinta specier. generis Panici Agrostographiae synopticae celeb. Kunthii quae species paniculae ramis simplicibus, locustis spicatis v. racemose dispositis am-

pletitur; unicum *P. prostratum* (p. 89 n. 97.) c. nostro ni fallimur, comparandum venit ob paleam fl. hermaphroditis inferiorem mucronatam. Sed in *P. prostrato* culmi repentes prostrati, rhachides imberbes folia vaginaeque ciliatae, quae omnia speciem nostram a prostrato alienam declarare videntur. —

DIGITARIA Scop.

(Panicl sect. Endl. gn. pl. n. 770. — Walp. Ann. III. 714.)

1. DIGITARIA CILIARIS Koel. Pers. (Kunth. Agr. p. 82. n. 43). Buse in pl. Jungh. III. p. 380.
Planta variabilis. In normali gluma inf. minuta supera $\frac{1}{2}$ spiculam haud aequans. variat: β . *spicis subternis*, gluma inf. subnulla, supera spiculae $\frac{1}{3}$ aequante.
 γ . *spicis subbinis*, gluma infera subnulla, supera spiculae $\frac{1}{2}$ aequante.
 δ . *spicis plurimis*, gluma supera dimidiam spiculam aequante aut et superante.
Hab. ins. Sumatrae pr. Padang (Jungh.)
2. DIGITARIA PES AVIS Buse in pl. Jungh. III. p. 380.
Ramis paniculae subtridigitatis, longis, divergentibus; spiculis ovato-lanc., gluma infera minuta deltoidea, supera spiculam dimidiam longa, pilosa; glumellae fl. neutrius nervis omnibus sub lente pilosellis; fol. lanc., glabris, b. ut et vaginarum ore pilis raris praelongis praeditis.
Hab. ins. Javae. Jungh. (pl. spithamaea).

3. DIGITARIA DIGITATA Buse in pl. Jungh. p. 381.

Ramis paniculae subquinis, strictis, approximatis; spiculis ovalib.; gluma infera nulla, supera pilis longis simplicib. hirsuta, ut et glumella hebetata membranaceo-marginata, spiculam subaequante; f. vaginisque glabris, culmo stricto. —

Hab. ins. Javae pr. Pesawahan (Jungh.)

Habitus macilentus; bipedalis etc.

4. DIGITARIA ROPALOTRICHA Buse in Jungh. III. 381.

Ramis paniculae subseptenis approximatis; spiculis ovalib., gluma infera subnulla, supera spiculae $\frac{2}{3}$ longa, aequae ac neutrius glumella pilis clavatis dense obsita, nervis glumellae neutrius aequidistantibus marginalib. crassis, rhachi pedicellisque hic illic setigeris, fol. glabris, vaginis ore parce pilosis, culmo erecto.

Hab. insulam Javae pr. Pesawahan (Jungh.)

Planta inter Digitarias speciosa, 2—3 ped. etc.

β . *glabrescens*: rhachi glabra, gluma superiore longiore.

Hab. ins. Javae sinum Wynkoopsbaai pr. Magelang. (Jungh.)

5. DIGITARIA PERTENUIS Buse l. c. p. 381.

Ramis paniculae subternis, alternis, strictis; rhachi tenui; spiculis ovalib., omnib. pedicellatis; gluma infera brevi amplectente, supera et neutrius glumella subaequalib. spiculam longis, nervis glabris, interstitiis pilis longiusculis obsitis, f. vaginisque longe pilosis, radice repente.

Hab. Sumatrae ins. pr. Padang. (Jungh.)

Planta pusilla.

6. DIGITARIA PSEUDO-ISCHAEMUM Buse in pl. Jungh. III. p. 382.

Paniculae ramis subbinis (?) latis, spiculis ovato-lance., gluma infera minima scariosa, supera lanc. trinervia, flor. neutrius glumella infera 7-costata, ambob. floris fertilib. glumellas laeves aequantib.; f. distichis, crassis, late lanceolatis, glabris, marg. scabriusculis; ligula magna; vaginis glabris; culmo prostrato, nodis barbatis.

Habit. in Sumatrae littoralib. arenosis. (Jungh.)

7. DIGITARIA UROCHLOIDES Buse in pl. Jungh. III. p. 382.

Paniculae ram. paucis, longe remotis, elongatis, tenuib.; ramul. multis, alternis, aeq. remotis sed brevib., spicaeformib., spiculas 5—6 aequaliter pedicellatas subdistichas gerentib.; gluma infera spiculae $\frac{1}{2}$, supera $\frac{2}{3}$ longa, ambabus pilosellis, uti et fl. neutrius glumella solitaria, fl. fertilib. glumella infera ciliata ap. hispidula; fol. cordato-lanceolatis vaginisque setosis, his dense ciliatis, culmo b. procumbente, radicante.

Hab. ins. Javae pr. Weltevreden. (Jungh.)

Planta elegantula, habitu Echinochlaenae cujusdam, etc.

8. DIGITARIA PRURIENS Buse (Kunth. Agr. p. 83. no. 50.)

variat: β . gluma supera spiculae $\frac{1}{3}$ aequante.

In desertis Aegypti inferioris secus maris rubri oram.

781/d. **AMPHOCHAETA** Ands. (nov. gen.)

En. pl. ins. Galopag. in V. Akad. Handl. 1853. p. 136. et in Eugenie Rese 1851—1853. p. 45.

Spiculae biflorae, setis subinvolucratae; flosculi mutici, inferior masculus vel neuter 1-paleaceus, superior bipaleaceus. Involucrium deciduum e setis 2—4, ad utrumque latus spiculae collectis constans. Glumae 2-hyalinae inaequales muticae convexae. Paleae flosculi hermaphroditi membranaceae, convexae, exterior apiculata, interior superiorem margine amplexens. Lodicae minutae concavae truncatae, cuneiformes. Stamina 3, antheris rufescentibus, filamentis brevissimis. Ovarium glabrum, styli elongati, stigmata obscure purpurea, pilis simplicibus penicellata.

Genus a Setariis distinctissimum, ob setas involucrales in fasciculos duos spiculis collaterales divulsas cum spicula ipsa deciduas, et paniculam e ramis elongatis axillaribus racemosam. Habitu externo cum *Setaria* dioica (quae forsan etiam e *Setariis*

ceteris removenda!) congruit, sed differt aperte involucris et spiculis. — Ab ill. Nees ad genus *Gymnothrix* a Steudel ad *Pennisetum* relatum ab utroque aperte differt.

1. AMPHOCHAETA EXALTATA And. l. c.

Culmo rigido erecto elato, foliis convoluto-filiformibus; spicis axillaribus strictis rigidis; spiculis lanceolato-acutis, albido-viridibus.

Gymnothrix paupera Nees Mss.

Pennisetum pauperum Steud. Syn. II. 102.

Hab. inter lapides vulcanicos locis editioribus ins. Albemarle (Ipse). Caespites magnos et elevatos format, caet.

782. **PENICILLARIA** Swartz.

(Knth. ex I. 1. p. 165. et I. 2. p. 120.)

Penicillariae species novae auctore A. Braun, ind. sem. h. Berol. 1855.

Illustrissimus comes Schlieffen a Schlieffenstein ex itinere Africano redux Julio anni 1854 grana frumenti cujusdam in regno Cordofano sub nomine „Dogghe“ („Doche“ sec. Ehrenb.) culti benigne mihi communicavit, e quibus autumnis ejusdem anni in horto botanico satis et plantulis novellis per hiemem in caldario servatis aestate insequente sub diu plantae speciosae, laetifoliae prodierunt habitu cum *Penicillaria* spicata, antiquitus in hortis culta, convenientes, sed, id quod accuratius examen probavit, non solum ab omnibus *Penicillariis* hucusque cognitis, sed etiam inter se quoad speciem aut varietatem saltem distinctae.

Penicillariae genus a Willdenowio a. 1809 conditum, in Steudellii opere novissimo iterum *Penniseto* subjunctum est, a quo antherarum loculis apice penicillatis et stylis connatis satis differt. Aequae ac alia plantarum cerealium genera species et varietates numerosas, haud facile distinguendas amplectitur, quarum plures jam veteribus cognitae auctorum recentiorum confusione maxima intricatae sunt, id quod cl. Schlechtendal in *Linnaeae* volumine XXV. (1852) p. 530. exposuit. Species nonnullas novas cl. Figari et De Notaris in *Agrostographiae aegyptiacae* fragmentis (1853) exposuerunt, aliae ineditae, nec non varietates complures novae e Nubia, Senegambia et regno Mossambicensi in herbario reg. Berolinensi asservantur.

1. **PENICILLARIA CORDOFANA** A. Braun et Bouché l. c.

Foliis nudis; spica oblongo-cylindracea; involucris brevissime pedunculatis, dense sursum imbricatis demum patentissimis, plerumque unispiculatis, setis spiculas subaequantibus vel paulo superantibus, una reliquis longiore spiculam longius superante interioribus laxe plumosis; spiculis oblongis, bifloris (rarissime unifloris); glumis spathaceis (prima et secunda) minimis, longitudine subaequalibus, hyalinis, enerviis, subenticulatis; gluma tertia spicula $\frac{1}{2}$ — $\frac{1}{4}$ brevior, oblonga, obtusa, evidenter mucronata, 3—5-nervi, glumellam longiorem et florem masculum amplectente; gluma quarta breviter subulato-acuminata, 5—6-nervi, prope marginem tenuissime et brevissime piloso-ciliata, glumellam paulo brevior nudam et florem hermaphroditum amplectente. Culmus 4' circiter altus, nodis subbarbatis. Foliorum vagina laminae nuda; lamina utrinque scabra 8—10 lata, caet.

In regno Cordofano colitur sub nomine „Dogghe“.

Huic formae sequentes proxime accedunt, quas omnes, praesertim glumarum forma longitudine relativa et nervatura abisque notis distinguendas, ad interim nominibus propriis specierum loco propono, quamvis ad typos specificos pauciores demum revocandas esse persuasum mihi est.

2. *PENICILLARIA NUBICA* A. Br. l. c.

Spica cylindrica, densissima; involueris breviter pedunculatis (pedunculis involucri dimidio brevioribus, ubique villosis), patentissimis, infimis demum reflexis, bispiculatis, setis spiculas subaequantibus, una (vel binis) longiore; spiculis aut bifloris, aut unifloris; glumis spathaceis minimis hyalinis enerviis (prima in spiculis unifloris fere deficiente); gluma tertia aut florem masculum fovente eaque spicula $\frac{1}{3}$ — $\frac{1}{5}$ brevior, 3(—4)-nervi, emarginata, vix mucronata, glumellam longiorem dorso ciliatam amplectente; aut sterili spicula $\frac{2}{3}$ — $\frac{3}{4}$ brevior, truncato-emarginata, ciliolata, tenuissime 1—3-nervi; gluma quarta 5—6-nervi, versus marginem evidentius pilosa. (Nodi barbati; vaginae verrucis setigeris minimis parce obsitae; spicae 3" circiter longae, $\frac{1}{2}$ " crassae; caryopsis matura e glumis emergens, magis pyriformis et crassior quam in forma cordofana, colore in coeruleum vergente. Spiculae uniflorae praesertim in spicis serotinis ramorum obviae.)

In Nubia cultam legit cl. Ehrenberg.

3. *PENICILLARIA ARABICA* A. Br. l. c.

Spica elongata, cylindrica, densissima; involueris breviter pedunculatis (pedunculis ut in praecedente) 1—2-spiculatis, setis spiculas subaequantibus, una reliquis vix longiore; spiculis minoribus et obtusioribus, omnibus unifloris; gluma prima fere deficiente; secunda minima, enervi; tertia (sterili) spicula $\frac{3}{4}$ — $\frac{1}{2}$ brevior, emarginato-truncata, ciliolata, hyalina, tenuissime 1—3-nervi, gluma quarta apice attenuata, vix acuminata, 5-nervi, versus marginem pilosiuscula.

Colitur in Arabia felici (herb. Nees ab E.)

P. cordofana et *nubica* glumella floris masculi glumam superante conveniunt, nec nisi notis inferioris momenti differunt. *P. arabica*, in qua spiculus uniflorus tantum inveni, his certo intime juncta est, id quod spiculis bifloris demum repertis probandum erit. Hae tres sine dubio conjunctum typum specificum proprium repraesentant, *P. Doche* salutandum.

4. *PENICILLARIA COMPACTA* Al. Br. et Bouché l. c.

Spica oblongo-cylindracea, crassa, densissima; involucri breviter pedunculatis (pedunculis ut in praecedente), patentissimis, bi- (rarissime tri-) spiculatis, setis spiculas vix aequantibus (seta eminenti nulla); spiculis bifloris (rarissime unifloris); gluma prima minima, hyalina, enervi; secunda spicula $\frac{2}{5}$ — $\frac{2}{3}$ brevior, truncata, obtusa vel acuta, hyalina, 1—3-nervi; tertia spicula $\frac{1}{6}$ brevior, obtusa, mucronata, 5- (rarius 3—4, vel 6-)nervi, glumellam paululum brevioram dorso piloso-ciliatam et florem masculum amplectente (rarissime sterili, spicula $\frac{2}{3}$ brevior, trinervi); quarta breviter subulato-acuminata, 5-nervi, prope marginem piloso-ciliata. (Nodi barbati, vaginae nudae, folia sparse pilosa, spica $3\frac{1}{2}$ " longa, ultra $\frac{1}{2}$ " crassa.)

In Nubia cum *P. nubica* cultam legit cel. Ehrenberg.

P. nubicae simillima, sed praeter spicam crassiorem et defectum setarum involucri eminentium gluma floris masculi glumellam paululum superante et gluma secunda magis evoluta, nervis tenuissimis 1—3 percursa essentialiter differt. Nihilominus ad typum *Penicillariae Doche* pertinere videtur.

5. *PENICILLARIA SPECIOSA* A. Br. et Bouché l. c.

Spica majore et laxiore, cylindraceo-elongata; involucri breviter pedunculatis (pedunculis ut in praecedentibus, nonnunquam longioribus spiculas subaequantibus, nec non longius pilosis), erecto-patentibus, 2- (rarissime 1- vel 3-) spiculatis, setis spiculas aequantibus, una reliquis longiore; spiculis bifloris (rarissime unifloris); gluma prima fere deficiente; secunda brevissima, truncata, hyalina, enervi; tertia spicula $\frac{1}{2}$ — $\frac{1}{6}$ brevior, obtusa, validius mucronata, 5—7-nervi, glumellam subaequilongam dorso ciliatam et florem masculum amplectente, (rarissime sterili, spicula $\frac{2}{3}$ brevior, 1—3-nervi); quarta longius acuminata, 7-nervi, laxe pilosa. (Nodi barbati; vaginae parce verrucoso-setulosae; folia latissima, ultra pollicem (ad 15") lata; spica 5—6" longa, $\frac{1}{2}$ " et ultra crassa.)

In Nubia cum *P. nubica* et *compacta* cultam legit cel. Ehrenberg.

Forma spicae magnitudine et foliorum latitudine insignis a praecedente praeter spicam laxiorem praesertim nervorum glumae tertiae et quartae numero diversa.

6. PENICILLARIA VULPINA A. Br. et B. I. c.

Spica subcylindracea, versus apicem sensim attenuata, minus stricta; involucri brevissime pedunculatis (pedunculis quartam spicularum partem aequantibus, pilosis), erecto-patentibus, unispiculatis (rarius bispiculatis), setis spicula sesqui-, nonnullis duplo longioribus; spiculis bifloris, rarius unifloris; glumina prima fere deficiente, secunda brevissima, hyalina, nervi (rarissime magis elongata et nervi rudimento instructa); gluma tertia aut florem masculinum fovente eaque spicula $\frac{1}{2}$ brevior, obtusa, mucronulata, 6-7-nervi, glumellam aequilongam apice anguste productam dorso ciliatam amplectente; aut sterili spicula $\frac{2}{3}$ brevior, mucronulata, tri-nervi; quarta longius acuminata, 6-7-nervi, versus marginem pilosa, (Nodi pilosi; vaginae verruci setulisque crebrioribus obsitae; lamina foliorum utrinque setuloso-pilosa; antherarum loculi apice ut in reliquis penicillati, basi longius apiculati; caryopsis minor glumis immersa).

In consortio praecedentium in Nubia culta, l. cel. Ehrenberg.

Spicarum habitu peculiari, subflexuoso, propter setas longiores magis pennise-toideo, nec non colore violascente vel ferrugineo-rufescente a praecedentibus magis discrepat, sed glumarum forma et nervatione cum *P. speciosa* omnino fere convenit. Glumella floris masculi et hermaphroditi in apicem abrupte angustatam longius producta, ut in sequente, quacum typum specificum proprium, cui nomen *P. typhoideae* reservari posset, sistere videtur.

7. PENICILLARIA PLUKENETH A. Braun et Bouché l. c.

Spica subcylindrica, stricta; involucri brevissime pedunculatis (pedunculis ut in praecedente), erecto-patentibus vel demum patentissimis et inferioribus subreflexis, 1-2-spiculatis, setis spiculas subaequantibus vel vix superantibus, seta una reliquis nonnunquam longiore; spiculis aut bifloris aut unifloris, angustioribus; gluma prima minima aut fere deficiente; secunda brevissima, dilatata, hyalina, nervi; gluma tertia aut florem masculinum fovente, spicula $\frac{1}{2}$ - $\frac{1}{3}$ brevior, oblongo-lanceolata, obtusa vel late emarginata, mucronulata; 3- (rarius 5-) nervi, glumellam aequilongam apice anguste productam dorso vix ciliatam amplectente; aut sterili spicula $\frac{1}{2}$ - $\frac{3}{4}$ brevior, ovata, apiculata, tri-nervi; gluma quarta sensim acuminata, 7-9-nervi (rarissime 5-nervi), versus marginem parce et brevissime pilosiuscula. (Praecedentibus minus robusta; vaginae tuberculis crebris setiferis obsitae, nec non foliorum lamina setoso-pilosa; spica *Alopecuri* spicam aemulans, $1\frac{1}{2}$ -3" longa, pollicem dimidium fere lata, versus apicem vix attenuata; glumella floris hermaphroditi dorso papillosa)

In Aegypto, ubi „Doche“ appellatur sec. Ehrenb.

A praecedente praesertim differt involucri setis brevioribus et nervatura glumae tertiae; caeterum valde variat. In herb. reg. adsunt: a) *forma major* spica elongata densa, spiculis inferioribus subreflexis, omnibus bifloris (in insulis incultis petrosis prope Suan lecta a cl. Ehrenberg); b) *forma media*, spiculis erectis, plerisque bifloris (prope Syene lecta a cl. Sieber); c) *forma depauperata*, spica acutiore magis rufescente, spiculis erectis omnibus unifloris (cum praecedente a Siebero lecta); d) *forma hortensis* vaginis foliisque nudis, involucri unispiculatis, spiculis unifloris, gluma quarta 5-nervi (ex horto Berolinensi). Ad formam a) pertinere videtur *Pennisetum typhoideum* Del. Fl. de l'Eg. t. 8; forma b) et c) *Penicillariam Sieberianam* Schlecht. Linnæa XXV. (1852.) p. 565. sistunt; forma d) vera est *P. Plukenetii* Link.

Hort. Berol. I. (1827.) p. 221. in hortis cum *Penicillariae* spicatae forma angustiore saepe confusa. *P. Plukenetii* Jacq. Ecl. Gram. t. 47. (sine descriptione edita) habitum convenit, sed ex icone pedunculis longioribus et glumella floris masculi glumam superante differt. Ad typum *P. typhoideae* porro pertinere videntur species sequentes a cl. Figari et De Notaris propositae:

8. *PENICILLARIA FALLAX* Fig. et De Not. *Agrost. aegypt. fragm.* II. p. 55. *Acta Tor.* 1854 p. 371 t. 29 f. 1—12. in Nubia superiore ad flumen album lecta, quae secundum iconem et descriptionem autorum spiculis partim unifloris, partim bifloris aliisque notis cum *P. Plukenetii* convenit, sed gluma tertia in spiculis bifloris quartam aequante, in unifloris spicula dimidia longiore anguste lanceolata uninervi differt. — A. Braun, l. c.
9. *PENICILLARIA RADDIANA* Fig. et De Not. *ib.* p. 57. in Aegypto a Raddio lecta, plerisque notis, praesertim spiculis omnibus bifloris et gluma floris masculi emarginata cum formis majoribus *P. Plukenetii* convenire, nec nisi gluma secunda rudimento nervi instructa differre videtur. A. Br. et Bouché l. c. — His denique accedit forma e seminibus Cordofanis culta secunda:
10. *PENICILLARIA SOCIA* A. Braun et Bouché l. c. Foliis nudis; spica cylindracea; involucri brevissime pedunculatis, sursum imbricatis, plerumque bispiculatis, setis interioribus spiculas paulo superantibus laxae et parce plumosae; spiculis lanceolatis, sensim acuminatis; glumis spathaceis angustis, prima brevissima hyalina enervi, secunda paulo longiore hyalina 1-3-nervi; gluma tertia spiculam dimidiam superante, 3-nervi, glumellam minimam depauperatam includente; quarta sensim in acumen subulatum attenuata, 5-nervi, nuda, glumellam paulo brevioris et florem hermaphroditum amplectente.

Planta debilior, nodis breviter barbatis; foliis angustioribus, vaginis ore barbatulis, caeterum nudis; lamina supra magis quam infra scabra. Spica angustior, vix tripollicaris. Rachis breviter hirsuta. Pedunculi brevissimi, basi pilis brevibus cincti. Spiculae geminatae, rarius solitariae, 6-7mm. longae intra involucrium brevissime pedicellatae. Involucri setae stramineae, spiculas subaequantis, nonnullae (2-3) longiores et ultra spiculas emergentes, omnes evidenter scabrae, interiores medio parce plumosae. Spiculae omnes uniflorae, flore masculino non evoluto. Gluma prima minima, oblonga, obtusa vel emarginata; secunda paulo longior, ovata, integra vel apice subdentata, nervis 1-3 tenuissimis percursa, caeterum tenuissime membranacea et hyalina. Gluma tertia spicula $\frac{1}{3}$, rarius $\frac{1}{2}$ brevior, oblongo-lanceolata, ex apice obtuso cuspidata, margine membranacea, trinervis vel rarius 5-nervis, nervis lateralibus brevioribus et tenuioribus, glumellam depauperatam $\frac{2}{3}$ brevioris hyalinam includens. Gluma quarta longe et sensim acutata, 5-nervis, ad nervos scabriuscula, caeterum glabra, glumellam includens brevioris, apice valde et abrupte angustatam, truncato-bidentatam, dorso minutissime papillosam. Antherae loculi apice penicillati, basi apiculati. Stylus simplex persistens; stigma elongatum ad medium bifidum, breviter pilosum.

In consortio *Penicillariae cordofanae* colitur.

Proxime accedit ad *Pen. vulpinam* et *Plukenetii*, sed setis involucri parcius plumosae, glumis spathaceis angustis, gluma tertia longius cuspidata et gluma quarta sensim in acumen longum producta valde singularis est. Nihilominus (una cum *P. fallaci* et *Raddiana*) ad typum *P. typhoideae* pertinere videtur.

11. *PENICILLARIA SPICATA* Willd. *Enum. et Schlecht.* l. c. p. 563, antiquitus nota et teste Clusio per Hispaniam in hortos introducta, secundum Jacquinum (qui Arduinum citat) in regno Tunetano nomine „Droh“ culta, a praecedentibus omnibus longius recedit et speciem bene distinctam repraesentare videtur. Spica omnium crassissima, oblonga; pedunculus involucri sesqui-vel duplo longior, longe pilosus; involucrium spiculas vix aequans, bispiculatum (rarius tri-vel unispiculatum); spiculae biflorae, rarissime uniflorae; glumae spathaceae minutae, dilatatae, hyalinae, enerves; gluma tertia spicula $\frac{1}{4}$ - $\frac{1}{3}$ brevior (in spiculis unifloris $\frac{2}{3}$ brevior), late truncato-rotundata vel leviter emarginata, apiculata, trinervis, glumellam aequilongam apice non productam amplectens; gluma quarta breviter acuminata, 5-nervis, versus marginem longo et dense barbata. (Vidi specimina ex horto Berolinensi, Carlsruhano, Parisiensi etc.) A. Braun l. c.

12. *PENICILLARIA WILLDENOWII* Klotzsch ined. secundum specimen olim in horto Berolinensi cultum involuero brevi, spicularum indole et praesertim gluma quarta longe barbata cum *P. spicata* convenit, sed spica subcylindrica elongata, superne sensim attenuata et pedunculis involuero dimidio vix longioribus ad *P. Doche* et typhoideae typum accedit. Gluma tertia spicula paulo brevior, latissime truncato-rotundata, medio vix apiculata, plerumque 5-nervis. — *Al. Br. l. c.*
13. *PENICILLARIA MOSSAMBICENSIS* Klotzsch ined., a cl. Peters in regno Mossambicensi, ubi a Lusitanis „Mexoeira“ dicitur, lecta, spicae habitu *P. Willdenowii* et magis etiam *P. speciosam* aemulatur et spicularum indole cum priore adeo convenit, ut ad eundem typum pertinere videatur. Caeterum a *P. Willdenowii* differt glumis 1- et 2-elongatis (prima spicula $\frac{2}{3}$, secunda $\frac{1}{2}$ brevior) et gluma tertia (floris masculi) quartam margine inconspicue pilosulam (nec longe barbata) fere aequante. — *Al. Br. l. c.*
14. *PENICILLARIA DEFLEXA* Anders. in herb. reg. Berol., itidem in regno Mossambicensi culta et a cl. Peters reportata, habitu spicae minus crassae, exacte cylindricae et involucri (spiculis) densissime confertis, superne patentissimis, inferne reflexis *Penicillariam typhoideam* in *Flor. aegypt.* a Deileo depictam aemulatur, sed glumarum characteribus ab omnibus formis aegyptiacis supra commemoratis longe diversa est. Pedunculus dimidium involucrum aequans, pilosus. Involucrum spiculas geminatas aequans vel paulo superans setis valde plumosis, eminentibus nullis. Pedicelli spicularum proprii satis elongati, quartam vel tertiam spiculae partem aequantes. Spiculae biflorae, rarius uniflorae, oblongae, obtusiusculae. Glumae spathaceae hyalinae, enes. ves. prima in spiculis unifloris valde depauperata, secunda major truncata quartam spiculae partem nonnunquam aequans. Gluma tertia in spiculis unifloris spiculae dimidia longitudine, late truncata et emarginata, 4—5-nervis; in spiculis bifloris spiculam fere aequans, late truncata (non mucronata), 4—5-nervis, glumellam aequilongam apice late truncatam amplectens. Gluma quarta (floris hermaphroditi) apice trifida (i. e. profunde emarginata et medio mucronata, mucrone lobos laterales aequante), 5-nervis, margine brevissime ciliata, caeterum nuda et aequae ac glumella durius cartilaginea. — *Al. Br. l. c.*
15. *PENICILLARIA MACROSTACHYA* Klotzsch ined. (*P. nigritarum* Schlecht. l. c. p. 561. Panic Americani sesquipedalis spica Clus. plant. hist. lib. VI. p. CCXVI.) in Senegambia sub nomine „Petit-mil“ culta, secundum specimen herbarii Kunthiani praecedenti affinis, a qua differt spica crassiore et longiore, omnium longissima, pedis longitudinem superante (in specimine altero herb. Kunth, fasciato-bipartita!); involuero brevior; spiculis patentibus, sed non reflexis, atro-purpurascensibus, intra involucrum longe pedicellatis indeque involucrum longe superantibus, geminatis, abbreviatis, omnibus bifloris; glumis et glumellis omnibus latioribus; gluma quarta minus profunde emarginata, medio latius apiculata, versus marginem pilis longis dense barbata, glumellis quoque dorso secus nervos longe ciliatis.
16. *PENICILLARIA LEUCOSTACHYA* Klotzsch ined., itidem in Senegambia sub nomine „Petit-mil“ culta, praecedenti certo affinis, sed minor et spica cylindrica, angusta, obtusa, albida insignis. Involucrum brevissime pedunculatum (subsessile), spiculas aequans, setis nonnullis spiculas paulo superantibus, interioribus plumosis. Spiculae geminatae, brevissime pedicellatae, oblongae, obtusiusculae, biflorae. Glumae involucales hyalinae ciliolatae, prima angustior et spicula multoties brevior, secunda latior, spicula $\frac{3}{4}$ vel $\frac{2}{3}$ brevior. Gluma tertia spicula $\frac{1}{2}$ brevior, latissime truncata at leviter emarginata (non apiculata), margine superne fimbriato-ciliata, 3—5-nervis, glumellam aequilongam late truncatam dorso pilosam amplectens. Gluma quarta breviter acuminata, juxta apicem utrinque auriculata, 7-nervis, versus marginem longe pilosa. (V. spec. a cl. Leprieur lectum in herb. Kunth.) — *Al. Br. l. c.*
- P. deflexam*, *macrostachyam* et *leucostachyam*, quamquam facile distinguendas, tamen ejusdem typi speciei modificationes esse censeo, sub nomine communi *Penicillariae nigritarum* conjungendas.

17. *PENICILLARIA PERROTTETII* Klotzsch ined., in Senegambia ad Walo a cl. Perrottet 1830 lecta (nescio utrum spontanea an culta), a praecedentibus longe discedit. Spica cylindrica, elongata, laxa, fusco-nigricans; involucria sessilibus, spiculas magnas geminatas aequantia, e setis numerosissimis fusco-nigricantibus, interioribus albo-plumosis, una reliquis longiore et spiculis superante; spiculae biflorae, attenuatae, laevigatae, durae, glumae spathaceae minutae, truncatae et subdentatae, enerves, coloratae (fusco-nigricantes); gluma tertia spicula paulo brevior, oblonga, late exciso-truncata, 3-5nervis, glumellam paulo longiorem subtruncatam (apice non angustato-productam) nudam amplectens; gluma quarta breviter acuminata, superne conspicue 7-nervis, margine inconspicue ciliolata. (V. in herb. Kunth.) — Al. Br. et Bouché l. c.
18. *PENICILLARIA STENOSTACHYA* Klotzsch ined., in Senegambia prope Caybar a cl. Leprieur 1830 lecta, cum praecedente ad eundem typum specificum, cui nomen *Penicillariae nigricantis* propono, pertinet, insignis spica magis etiam elongata et angustata, involucri omnino sessilibus unispiculatis, setis spicula brevioribus, una alterave spiculam aequante, glumis spathaceis minus coloratis subfuscescentibus, gluma tertia plerumque 3-nervi, quarta 5-nervi, glumella florismasculi et hermaphroditi tenuissime papillosa. Color spicularum et setarum demum fusco-nigricans, ut in praecedente. Caryopsis glumas non excedens, a dorso valde compressa, diaphana, corneo-cinerascens. (V. in herb. Kunth.) — Al. Braun l. c.
19. *PENICILLARIA ALOPECUROIDES* (*Panicum alopecuroideum* et *Alopecurus indicus* L.; *Penic. ciliata* Willd. Enum.; *Penic. cylindrica* Röm. et Sch.; *Pennisetum* Linnæi Kunth En.; *Pennis. alopecuroides* Wight herb.), quam in peninsula Indiae orientalis (spontaneam?) cl. legit Wight, formis debilioribus *Penicillariae vulpinae* et Plukenetii quidem similis est, sed certe speciem distinctam sistit, colore spicae helvolo vel fusco-aureo primo intuitu recognoscendam. Spica cylindrica, superne attenuata, laxa, sursum imbricata. Pedunculus involucri spiculis duplo vel quadruplo brevior, pilosus. Involucrum spiculis geminatis, rarius solitariis sesqui-vel duplo fere longius, setis interioribus plumosis, nulla eminente. Spiculae breviter (altera paulo longius) pedicellateae, biflorae vel uniflorae. Glumae spathaceae perminutae, rotundatae, hyalinae, enerves; gluma tertia aut florem masculinum fovens, spicula $\frac{1}{2}$ brevior, apice late truncata et fimbriato-lacera, 5-nervis, glumellam paulo longiorem apice pariter truncatam amplectens; aut sterilis, spicula dimidia brevior, plerumque trinervis: gluma quarta superne attenuata et convoluta, apice truncata et fimbriata, 7-9-nervis, margine vix ciliolata, stramineo-nitens et cartilaginea. Glumella floris hermaphroditi quoque cartilaginea et glabra, apice non angustato-producta. Antherarum loculi apice penicillati, basi apiculati. (V. spec. Wightiana in herb. reg. Ber. et Neesiano. — Al. Br. l. c.
20. *PENICILLARIA ROXBURGHII* (*Panicum spicatum* Roxb. *Penicillaria* spicata Wallich in herb. reg. Ber.), planta in Ind. orientali nomine „*Bujera*“ s. „*Gantee*“ culta, secundum specimen Wallichianum in horto bot. Calcuttensi cultum a praecedenti differi statura majore, spica crassiore et densiore (5" longa et $\frac{3}{4}$ " fere crassa), pedunculis involucri subaequantibus, involucri plerumque unispiculatis (ad basin spicae bispiculatis), spiculas brevius superantibus; spiculis bifloris; gluma tertia spiculam subaequante, 3-4nervi, glumellam vix longiorem includente. Color aureo-nitens ut in praecedente, cujus varietas culta esse videtur.
- Nomine communi *Penicillariae indicae* utramque conjungendam esse censeo. — Al. Braun et Bouché l. c.
21. *PENICILLARIA GYMNOTHRIX* A. Braun et Bouché l. c.
- Folis nudis; spica cylindrica, spiculis demum patentissimis; involucri brevissime pedunculatis, plerumque unispiculatis, setis spiculam partim aequantibus, partim paulo superantibus, una spiculam duplo superante, omnibus nudis, obsolete scabriusculis; spiculis lanceolatis, sensim acuminatis, nudis; gluma prima et secunda spicula multoties brevioribus, subaequalibus, hyalinis, acutis, uninerviis; gluma tertia sterili, spicula $\frac{1}{4}$ - $\frac{1}{2}$ brevior, lanceolata, cuspidata, trinervi; quarta sensim acuminata; 5-nervi,

glumellam aequilongam superne valde angustatam et florem hermaphroditum amplectente.

Statura et folia *Penicillariae* sociae; nodi parce pilosi; spica longius exserta magnitudine spicae *P. sociae*. Pedunculi brevissimi basi pilosi. Involucra unispiculata, in parte inferiore spicae nonnunquam bispiculata. Setae involucri violascentes. Spiculae omnes uniflorae, 6—7mm. longae. Glumae 1. et 2. ovatae, nervo unico apicem plerumque attingente instructae, $\frac{3}{4}$ —1mm. longae. Gluma tertia quoque ad plurimam partem hyalina, nervis tribus viridibus scabriusculis percursa. Gluma quarta ovato-lanceolata, marginibus inflexis lanceolata, sensim attenuata et apice acuminata. Antherarum loculi, ut in reliquis, apice penicillati, basi apiculati, apiculis divergentibus. Stylus et stigma ut in reliquis.

Colitur commiscue cum *P. cordofana* et socia.

Haec species ab omnibus reliquis discedit involucro e setis non plumosis, sed, ut in *Penniseti* sectione *Gymnotrichis*, nudis, vix scabris composito; attamen veram *Penicillariam* esse antherarum et pistilli characteres probant.

Adnotandum denique est *Penicillariam* chinensem Nees Mspt. (*Pennisetum* Steud. Syn. p. 108), quod pariter involucri setis nudis gaudet, non hujus generis, sed verum *Pennisetum* esse. Antherae muticae (non penicillatae) et styli a basi fere distincti! (V. spec. in herb. Neesiano).

22. *PENICILLARIA TYPHOIDEA* Fig. et de Not. Acad. Tor. 1854. p. 371.

Penicillaria spicata R. et Sch. (Knth. Agr. I. p. 165. quoad plantam Delilii.

Pennisetum typhoideum Del. l. c. a specie sub *Penicillaria spicatae* nomine in vol. 2. p. 120. Agrostogr. Kunthianae descripta, certissime differt. In nostra ut in planta Delilii involucra cum locustis sessilia (sessiles ou très brièvement pedicellées Del. l. c.) patenti-deflexa, densissima (tout-à-fait horizontaux après la fécondation Del. l. c.) Setae involucror. locustas aequantes (les plus longues égalent les épillets Del. l. c.), dum e contra locustae in planta Kunthii c. involucris pedicellatae, setae involucrorum locustis breviores, quae, ni fallimur, est species *Penicillaria spicata* Roem. et Sch.

Hab. in Nova Zelandia: Northern Island, copiose in montibus aridis argillaceis (Banks et Solander etc.). In Tasmania copiose ut et in Australia extratropicali.

Gramen valde variabile, glaberrimum, v. foliis inferioribus vaginisque tomento mollibus. Culmi anni caespitosi, 1–3-pedales, inferne foliosi, Panicula 4–8-poll. longa, pallide flavo-virescens, lucida, spiciformis. — A *Dichelachne* recedit arista non contorta, ab *Agrostide* flosculo pedicellato, a *Mühlenbergia* glumis longis.

2. DICHELACHINE SCIUREA Hook. fil. (fl. New Zeal. p. 294): laevis v. culmis basi vaginis folisque scaberulis, foliis planis v. involutis, panicula elongata laxo rariflora, glumis inaequalibus acuminatis florem vix superantibus, arista tortili palea inferiore, scaberula subtriplo longiore. — Hook. f. Fl. Tasm. 2. p. 111. *Agrostis sciurea* Br. Prodr. *Mühlenbergia* Trin. Diss., Steud. synops. p. 180. 2. *Stipa micrantha* Nees Diar. Ratisb.

Hab. in Nova Zelandia: northern island, bay of island et Auckland (Cunningham, Colenso, Sinclair etc.). In Tasmania copiosa, New South Wales, Victoria, Insula Norfolk.

D. crinita gracilior, sed ei valde affinis, panicula subracemosa, pauciflora. Glumae quam in *D. crinita* brevioribus, flosculum aequantes; arista contorta paleam superiorem non quadruplo excedente.

3. DICHELACHINE STIPOIDES Hook. fil. (fl. New Zeal. p. 294 t. 66): caespitosa, glaberrima, polita, foliis elongatis strictis setaceo-involutis, panicula erecta contracta pauciflora parce ramosa, glumis laevibus longe setaceo-acuminatis flosculum $\frac{1}{2}$ excedentibus, paleis subcoriaceis inferiore sericeo-villosa, arista geniculata glaberrima flosculo bis terve longiore. — Hook. fl. Tasm. 2. p. 112. *Avena angustifolia* Banks et Sol. Mss.

Hab. in Nova Zelandia: northern island, in rupibus marinis: ora orientali (Banks et Solander); bay of island et Auckland (Sinclair etc.). In Tasmania copiose, praesertim prope mare.

Gramen pulchrum, dense caespitosum, rigidum, pallidum, habitu *Stipae*. Culmi $1\frac{1}{2}$ –3-pedales; folia teretia; panicula 4–6 pollices longa stricta erecta; glumae $\frac{1}{2}$ – $\frac{3}{4}$ poll. longae, albae 6 floridae membranaceae lucidae; palea inferior apice bidentata; arista circiter pollicaris.

798. **STIPA** L.

(Walp. Ann. III. 730.)

1. **STIPA** **ROSTRATA** Auds.

Anderss. En. pl. ins. Gallopag. p. 142; Eugenes Resa p. 142.

Panicula spiciformi, b. subinterrupta, ramis solitariis v. plurib. a b. spicatis et divisis stricte adpressis; glumis h. a. h. inaequalibus aristatis, inferiore breviter acuminata, superiore ap. bifida; flosculi palea exteriori, glumae inferioris aristam aequante, laevi, in rostrum 4—6; ies tortum attenuata, arista vix b. torta, 4-lineali.

Hab. locis maxime lapidosis et sterilib. c. *Setaria* Antillarum et Eutriana pilosa aliisque, reg. infer. insulae Chatham (Ipse). Aristidae subspicatae habitu externo et omnib. partib. spicularum similis, ut non nisi arista simplici rectiuscula accurate distinguatur. Radicis fibrae b. hirsutae, culmi elatiores, folia plana!

2. **STIPA** **POGONATHERA** Em. Desv. Gram. Chil. in Gay: Fl. Chil. t. VI. p. 277.

S. culmis teretibus, rigidis, duris, albido-pubescentibus; nodis glabris; foliis tereticonvolutis, intus pubescentibus; ligula oblonga pubescente, utrinque pilosa; panicula 6—12-pollicari, vagina summa basi circumdata, plumosa, obscura albida; glumis 3-nerviis, angustis, acuminatis, inferiore paulo majore, flore duplo longiore; floris pedicello glabro; palea inferiore 4—4½ lin. longa, angusta, tereti, fusiformi, abidopilosa, in rostrum glabrum, ultra apicem scarioso-appendiculatum attenuata; arista 3-pollicari, fere a basi usque ad apicem barbata, recurva; palea superiore vix ¼ brevior, lineari-oblonga, extus pilosa, concava; antheris 2½—3 lin. longis.

Hab. Provincia Coquimbo, Chili (Gay).

3. **STIPA** **CHRYSOPHYLLA** Em. Desv. Gram. Chil. in Gay: flora chil. t. VI. p. 278. t. 76. f. 2.

S. pulcherrima, dense, caespitosa, rigidissima, aureo-fulva; foliis scabris, filiformibus, tereti-convolutis, pungentibus: ligula brevi, obtuse biloba; panicula plumosa, stricta, contracta; glumis subaequalibus, 7—10 lin. longis, basi atro-violaceis, apice scariosis, nonnumquam albidis; flore 2½—3½ lin. longo; pedicello fere glabro; palea inferiore elongata, cylindracea, undique albo-pilosa, apice utrinque lobo scarioso coronata; arista 11—16 lin. longa, ultra medium geniculata, sub genu contorta et a basi barbata, supra genu nuda; pilis 3—4 lin. longis; palea superiore ⅓ brevior, extus pilosa.

Var. α *minor*. Foliis culmos 6—9 pollicares aequantibus; vagina summa 2—2½-pollicari, vix ventricosa; panicula 1½—2½-pollicari.

Var. β *major*. Foliis culmo 1—1½-pedali dimidio brevioribus, vagina summa ventricosa, 4-pollicari et ultra; panicula 3½—6-pollicari; glumis pallidioribus; flore magis velutino.

Hab. in Cordilleris elevatis Chilensibus (Gay).

4. **STIPA** **TORTUOSA** Em. Desv. Gram. Chil. in Gay: flora chil. t. VI. p. 281.

S. basi tortuosa, pulverulenta, ramosa, culmis 1—1½-pedalibus, 6—8 nodis, duris, striatis, tenuissime asperatis, a basi ad apicem scaberulis; internodiis rectis, rigidis, nodis saepius pubescentibus; foliis anguste linearibus, convolutis-filiformibus, 1½—3-pollicaribus; ligula ovata; truncato-lacera; panicula 2—5-pollicari, laxiuscula; glumis aequalibus, laxis, 5—6 lin. longis, nitide viridi-violaceis, 5-nerviis, nervis anastomosantibus; flore pedicellato, pedicello piloso; palea inferiore 2½—3 lin. longa, tereticonvoluta, pilis rufescentibus undique dense hirsuta, cum pilis 4½ lin. longa; arista non decidua, 11 lin. longa, nuda, contorta, bis geniculata, pubescente; palea superiore glabra, fere ½ brevior.

Hab. in Cordilleras de Donna Ana (Gay).

5. **STIPA** **BREVIPES** Em. Desv. Gram. chil. in Gay: flora chilena t. VI. p. 282.

S. caespitosa; culmis fertilibus 1½-pedalibus, duris, laevibus, obscure olivaceis; nodis glabris; vaginis laevibus, summa a panicula remota; culmis sterilibus vaginarum

laevium albidarumque tunica areta, bipollicari basi amplexis; foliis simul ex hac tunica exeuntibus, teretibus, junciformibus, incurvis; panicula 5—8-pollicari, angusta, depauperata; glumis subaequalibus, 5—6-lin. longis, ovatis, concavis, sordide rubescentibus; floribus cum pedicello minimo, $\frac{1}{8}$ lin. longo, hispido, 3—3 $\frac{1}{4}$ lin. longis; palea inferiore rubescente, undique pilis rigidis patulisque hispida, aequilaterali, fusiformi-elongata, cylindræa, apice truncata, utrinque lobulo scarioso aucta, pilisque longioribus quasi penicellata; arista rubescente, inferne torta, 1-pollicari, pilis densis brevibusque obsita; palea superiore inferiorem aequante; dorso hispida.

Hab. in provinciis centralibus Reipubl. Chilensis (Gay).

6. STIPA LAXA Em. Desv. Gram. Chil. in Gay Fl. Chil. t. VI. p. 283.

S. erecta, canescens, 2—2 $\frac{1}{2}$ -pedalis, culmis teretibus sub nodis velutinis pubescenti-scabris; foliis 5—9-pollicaribus, linearibus, convolutis, velutino-hirtis; vaginis apice pubescentibus; ligula fere nulla; culmis sterilibus $\frac{1}{2}$ brevioribus, velutino-hirtis; panicula effusa, laxissima, 4—8-pollicari, pallida, glumis lanceolatis, apice setaceo-acuminatis, medio latioribus, 6 lin. longis, pallidis; flore cum pedicello sericeo-piloso 3—3 $\frac{1}{2}$ lin. longo, compresso; palea inferiore inaequilaterali, hinc sub apice gibberula, usque ad medium pilosa, punctulata, elongato-obovata, in apicem brevem, angustum, non gibbosum, ciliis coronatum desinente; arista 25—28 lin. longa, nuda; palea superiore minima.

Hab. Chile (Gay).

7. STIPA MANICATA Em. Desv. Gram. Chil. in Gay Fl. chil. t. VI. p. 288.

S. caespitosa, erecta, culmo fertili bipedali, sterilibus multum brevioribus, basi non cylindræo-tunicatis; foliis 4—6-pollicaribus, lineari-convolutis, intus pilosis; ligula brevissima, plicata; vagina summa ventricosa, paniculae basim amplectente; panicula laxa, nutante, 8-pollicari; glumis angustis 5—6-lin. longis; flore cum pedicello sericeo-piloso 3 $\frac{1}{2}$ —4 lin. longo; palea inferiore undique tuberculato-scabra, praeter carinam ad medium usque pilosam glabra, aequilateri, fusiformi, utrinque attenuata, apice angustato, cylindrico, $\frac{1}{3}$ lin. longo, rubro-fusco, corona pilorum basi coadunatorum superne manicato; arista nuda, 19—21 lin. longa; palea superiore minuta; antheris 3, inaequalibus. — S. bicolor Cav.? V. tab. 466 (non Vahl Symb. II. 24.).

Hab. prope Santiago-Chile (Gay).

β . contorta Lge. (pug. I. p. 36): auctis non rectis sed spiraliiter flexuosis et invicem contortis. — Willk. et Lge. Prodr. fl. hisp. I. p. 59.

Hab. in collis gypsaceis ad Aranjuez.

9. STIPA DAMASCENA Boiss. diagn. XIII. p. 45:

S. perennis caespitosa glauca foliis radicalibus convulso-filiformibus brevibus rigidis patulo-recurvis undique retrorsum puberulis, caulinis glabris limbo brevi tenui culmis erectis mediocribus, paniculae contractae foliis summis involutae ramis solitariis vel geminatis 1—2 spiculiferis, glumis longe setaceo-subulatis subinaequalibus glumella ad $\frac{2}{3}$ usque undique adpresse pilosula plus duplo longioribus arista caudæ inferne tortili pilosa superne plumosa 4—5 pollicari.

Hab. in collibus aridissimis pone urbem Damascus situs ubi legi in eunte Maio 1846.

Folia sesquipollicaria recurva, culmi semipedales, gluma inferior 11—15 lineas flosculus 5—6 lin. longus. St. arabica cui affinis differt foliis glabris duplo longioribus tenuioribusque rectis, glumis subaequalibus. St. Ehrenbergiana habet staturam elatam et aristas elongatas St. pennatae.

10. STIPA TENACISSIMA L. Explor. scient. de l'Alg. II. p. 79.

Macrochloa tenacissima (Kuth. en. I. 179. et suppl. 132.)

800¹. **URACHNE** Trin.

(Walp. Ann. III. p. 727.)

1. **URACHNE SPHACELATA** Boiss. et Buhse (in N. Mém. de la Soc. des Natur. de Moscou. v. XII. p. 330):

Radice fibrosa dense caespitosa basi vaginis adpressis foliorum vetustorum obsita, foliis caespitum fasciculatis anguste linearibus supra scabris brevibus, culmis adscendens, foliis culmeis limbo brevi vagina longissima, ligula elongata lacera, panicula flexuosa triangulari-laxa, ramis 5—7 paucifloris brevibus, glumis aequalibus oblongo-lanceolatis acutis glabris 7-nerviis viridibus apice nigro-sphacelatis flosculo lanceolato subtriquetro superne et basi interna puberulo glumis tertia e gluma vix apice exserta.

In montibus inter Isfahan et Kaschan ad pagum Ssou.

Foliorum radicalium limbus 2—3 pollicaris. Culmi pedales et ultra, panicula 3—4 pollices longa glumae tres longae. Affinis *U. holsiformi* a qua differt gluma dimidio minoribus apice sphacelatis, panicula brevi flexuosa, ramis paucispicatis. *U. Soon-garica* differt glumis basi violaceis, flosculo fulvo.

801. **ARISTIDA** L.

(Walp. Ann. III. 738.)

1. **ARISTIDA DIVULSA** Ands. En. pl. in Galapagos p. 143; Eugen. Resa.

Panicula 4—6 poll., ramosa, pyramidali oblonga, ramis plurib. vel subsolitariis pluries divisis, longis; glumis cuspidato-aristatis subaequalibus; flosculo glabro, apice cum arista articulo, infra articulum bis torto, setis patentibus arcuatis subaequalibus media subsemipollicari.

Hab. locis maxime lapidosis reg. inf. ins. Chatham c. *Setaria* Antillarum aliisque. (Ipse.)

Ab *Aristida* subspicata, cui certissime propior, differt: panicula in ramis patentibus divulsa (unde nomen), flosculo demum infra aristam bis tantum torto laevi setisque minus scabris.

2. **ARISTIDA CAUDATA** Ands. l. c. p. 144

Panicula 4—5 pollic., spicatum condensata, b. interdum interrupta, ramis a b. spicatis, brevissimis; glumis cuspidato-acutatis, superiore ap. subbifida, flosculo pubescente, longius rostrato, cum arista articulo, infra aristam bis v. semel torto, setis patentibus divaricatis scabriusculis.

Habitat locis lapidoso-graminosis insulae Indefatigable (Ipse).

Aristidam nostram divulsam et compactam quodammodo conjungit.

3. **ARISTIDA COMPACTA** Ands. l. c. p. 145.

Panicula 3—4 pollic., spicatum contracta oblongo-cylindracea, ramis a b. spicatis brevissimis, divisis; glumis ap. erosis v. bifidis, aristatis, inferiore breviori; flosculo glabriusculo, apice c. arista articulo, infra aristam quater torto, setis divaricatis subaequalibus, media subunciati.

Hab. locis siccissimis admodum elevatis insulae Albemarle. (Ipse.)

4. **ARISTIDA (ARTHATHERUM) BRACHYPTERA** Coss. et Balansa (Bull. de la Soc. bot. de France 1858 p. 169):

Rhizoma repens. Culmi 5—6 decimtr. alti, simplices vel ramosi, erecti, cylindrici praesertim sub nodis pubescentes. Folia convoluta, sensim attenuata et acuminata glabra, laevia; ligula brevis, truncata, fimbriata; vagina glabra, usque ad basin-fissa. Panicula angusta, recta, rachi glabra sed scabra, ramis 3—6 verticillatis contractis, inaequalibus, scabris. Glumae subaequales, oblongo-lanceolatae, sensim acuminatae, inferior 1-nervia, scabra, superior obsolete 3-nervia. Palea inferior oblongo-lanceolata, glabra; aristae glumas longitudine aequantes, quarta parte inferiore iis obtectae, media fere omni plumosa sed parte superiore nudiuscula, laterales glabrae

scabrae, patentes, capillares. Palea superior ovali-oblonga, truncata, enervia, glabra, membranacea, forma et minutie squamaeformis; callus linearis, velutina sed dorso pilis, glumella inferiore quarta parte brevioribus obsitus. Lodiculae 2 oblongae, integrae, truncatae; apicem versus latiores paleamque superiorem fere aequantes. Antherae 3, lanceolatae, glabrae; ovarium oblongum, glabrum; styli 2 terminales; stigmata plumosa, stylis duplo longiora. Maj. 2.

Hab. in arena mobili deserti Sahara a'gerici, inter Guerrara et Hadjira (Reboud) et ad El Abiod Sidi Cheikh (Cosson).

Ab affinis vere diversa. Proxima est *A. plumosae*, a qua differt aristis multo brevioribus.

5. *ARISTIDA CALYGINA* R. Br. Prodr. p. 173. — Steud. Synops. 140. 2. Hook Fl. Nov. Zel. p. 293.

Hab. in Nova Zelandia: northern island bay of island. (A. Cunningham).

β. *major*. Panicula per longa, coarctata¹, caeterum non diversa. — Java pr. Tjibogo, (Jungh.)

810. **AGROSTIS** L.

(Walp. Ann. III. 755.)

1. **AGROSTIS ARVENSIS** Ph. — Linn. XXIX. 87.

A. erecta; culmo gracili, 1—1½-pedali; internodio summo longissimo; foliis angustis, planis, ½—¾ lin. latis, scabris; ligula brevi, ovata; panicula 2—3-pollicari, angusta, paupera; ramis setaceis, pedicellisque brevibus scabris; spiculis vix 1 lin. longis; glumis lanceolatis, inferiore carina denticulata, superiore glabra; flore ¼ glumarum aequante; palea inferiore ovata, subtruncata, plerumque mutica, superiore triente saltem minore; rarius in aristam glumam fere dimidio superantem desinente.

In arvis prope Concepcion legit cl. Gay et in herb. Chil. sub nomine *Poa* N. 226. reliquit. Differt ab A. glabra glumis vix 1 lin. longis, superiore haud denticulata; ab exasperata glumis minoribus, paleis saltem ¼ glumarum aequantibus, nec dimidio brevioribus, plerumque inermibus; ab A. magellanica panicula pauciflora, glumis brevibus, paleis fere omnibus inermibus, a Gayana iisdem notis.

2. **AGROSTIS CHONOTICA** Ph. l. c.

A. caespitosa culmis 9—12-pollicaribus, usque ad paniculam contractam spiciformem vaginatis, vaginis foliisque glaberrimis; foliis explanatis, inferioribus 6—7-pollicaribus, supremis circa 1½ poll. longis, lineam latis; panicula 2—2½-pollicari; glumis subaequalibus, 2¼ lin. longis, cuspidatis, fere aristatis, dorso glaberrimis; flore vix 1 lin. longo, glaberrimo; palea inferiore apice truncata, denticulata, inermi, superiore minima.

In litore archipelagi Chonos dicti legit cl. Fonk.

3. **AGROSTIS CAMPESTRIS** Ph l. c.

A. caule elato, glaberrimo, fere usque ad paniculam foliato; vaginis supremis laevissimis; folio ultimo 5—6 lin. longo, 3 lin. lato, superius scabro; ligula abbre-

viata; panicula 6—9-pollicari, ovata, sauts laxa; ramis numerosis, subsenis in quovis verticillo, scabris, erectis; pedicellis spiculis $1\frac{1}{3}$ lin. longis brevioribus; glumis subaequalibus, e viridi, violaceo et fulvo pictis, laevibus, praeter nervum medianum glumae inferioris; flore unico, $\frac{2}{3}$ — $\frac{3}{4}$ glumarum aequante; palea inferiore lanceolata, hyalina, mutica; superiore dimidium inferioris aequante.

In insula Chiloe, locis cultis, invenit cl. Dr. Fonk. — Differt ab *A. glabra* Kth. ligula brevi, ramis verticillorum paniculae numerosioribus, spiculis minoribus, pallidis, palea superiore majore.

4. AGROSTIS PATAGONICA Ph. I. c.

A. erecta, 2—3-pedalis; culmo laevi, plurinodo, fere usque ad apicem foliato; vaginis glabris; foliis culmeis utrinque scaberrimis; $2\frac{1}{2}$ lin. latis; ligula obliqua 2 lin. longa; panicula 8-pollicari, densa, cernua; ramis densis pluribus in verticillis inferioribus, valde inaequalibus; pedicellis capillaribus, spiculis subaequantibus, scabris; glumis $1\frac{1}{2}$ lin. longis, ovatis, acutis, carinatis, in carina ciliolato-scabris; palea inferiore vix dimidiam glumam aequante, ovata, quinquenervi, arista brevi terminata; superiore dimidio brevior; callo glabro.

Ex expeditione sua ad lacum Nahucihuapi retulit cl. Dr. Fonk. — Differt ab *A. glabra* panicula densa, palea vix dimidium glumae aequante, plerumque distincte aristata.

5. AGROSTIS LASIANTHA Ph. I. c.

A. annua; culmis debilibus, fere filiformibus, 8 poll. longis, usque ad paniculam foliatis; foliis $\frac{3}{4}$ lin. latis, una cum vaginis glabris, laevibus; ligula elongata, lacera; panicula elongata, contracta, laxa, pauciflora; ramis geminis, capillaribus, ultra medium nudis; spiculis hyalinis, nervis glumarum modo viridibus; glumis 1 lin. longis, subaequalibus, lanceolatis, cuspidatis, uninerviis, nervo serrato scabro; flosculo dimidiam glumam aequante; palea inferiore ovata, apice subquadridentata, dense hirsuta, dorso aristata; arista paleam fere bis aequante; palea superiore inferiorem subaequante.

In umbrosis provinciae Valdiviae habitat.

6. AGROSTIS? ASPERULA Ph. I. c.

A. caespitosa, laete viridis; culmis strictis, gracilibus, 1— $1\frac{1}{2}$ -pedalibus, scabris; foliis brevibus, asperulis, caulibus 18 lin. longis, 1 lin. latis; vaginis pubescentibus ligula modice elongata, 1 lin. longa, rotundata; paniculae $2\frac{1}{2}$ —3 poll. longae, contractae, spiciformis, ramulis brevissimis, nullo longiore quam 6 lin., appressis; pedicellis 1— $1\frac{1}{2}$ lin. longis; glumis bitoris, lanceolatis, acuminatis, subaequalibus 2 lin. longis, carinatis, scabris, hyalinis, carina laete viridi; superiore trinervia, nervis lateralibus abbreviatis, trinerviis; floribus gluma brevioribus; palea inferiore enervia, cernua, obtusa, dorso rotundata, versus apicem violacea, margine hyalino terminata, marginibus involutis; palea superiore paulo brevior, dorso lato, plano, carinis viridibus, valde prominentibus; flore secundo pedicellato, sterili, inferiore dimidio minore; pedicello piloso; caryopsi paleis inclusa, oblongo-cylindracea, in ventre longitudinaliter bisulcata, stigmatibus sessilibus coronata.

In pascuis prov. Valdiviae legi, ni fallor loco los Pantanos praedii mei. — Floribus duobus spiculae ab Agrostide recedit, cujus habitum habet.

7. AGROSTIS (BROMIDIUM) KOELERIOIDES Em. Desv. Gram. Chil. in Gay Fl. chil. t. VI. p. 317. t. 77. f. 2:

A. annua, caespitosa, humilis; culmis filiformibus; vagina summa ventricosa; ligula ovata; foliis brevibus; planis vel convolutis; panicula 6—8 lin. longa, spiciformi; spiculis 1-floris, $1\frac{1}{4}$ lin. longis; glumis lanceolato-acuminatis, carina scaberrimis, florem 1-paleaceum fere duplo superantibus; callo piloso; palea lanceolato-elongata, 4-nervia, apice truncata et 4-seta, setis mediis brevibus, lateralibus palea dimidio brevioribus, supra basin aristam contortam, geniculatam, $1\frac{1}{2}$ -linealem gerente; antheris 3, subquadrangularibus, apice profunde bilobis, mitraeformibus. — A. anomala Trin. in Linnæa X. p. 301. (1835), et in Hb. Mus. Paris. Steud. Synops. p. 222 n. 52.

Koeleria chilensis Steud. et Hochst. in Herb. Monac., Un. it., Bertero n. 357 et 1069. Id. in Hb. Webb. — *Bromidium Koelerioides* Em. Desv. mss. in Hb. Berol.

Hab. in pascuis arenosis regni Chilensis; Tuillota, Montis La Leoni Rancagua (Bertero n. 357 et 1069), Valdivia (Cl. Gay), Conceon et Santa Rosa (Poeppig.)

8. AGROSTIS (PODAGROSTIS) SESQUIFLORA Em. Desv. Gram. Chil. in Gay; Flor. chil. t. VI. p. 318. t. 77. f. 3.

A. annua, caespitosa, pedalis; culmis erectis, filiformibus; f. 2—3-pollicaribus, breviusculis, longe acuminatis; ligula ovata, apice denticulato-lacera; panicula 2—3-pollicari, anguste contracta, violacea; ramis ad summum $1\frac{1}{2}$ -pollicaribus, paucifloris, apice tantum spiculigeris, pedicellisque denticulato-scabris; spicula 1— $1\frac{1}{4}$ lin. longa, subsesquiflora; pedicello floris secundi minimo; glumis subaequalibus, lanceolatis, laevibus; callo glabro; palea inferiore ovato-elongata, albida, 5-nervia, apice truncata, non denticulata, glumas subaequante; inferiore $\frac{1}{2}$ vel $\frac{1}{4}$ brevior, binervia, elongata, truncata; caryopside lutescente, $\frac{1}{2}$ lin. longa.

Hab. in Chili, Antuco (C. Gay). Vicina est *A. aequivalvis* Trin., quae differt rudimento fl. secundi medium primi aequante.

9. AGROSTIS (TRICHODIUM) GAYANA Em. Desv. Gram. Chil. in Gay Flor. chil. t. VI. p. 313.

A. repens, rhizomate squamis purpurascens tecto; culmis 8—9-pollicaribus, usque ad apicem foliatis; foliis planis, asperis; ligula elongata; panicula 4-pollicari, laxa; erecta, ramis ultra medium spiculigeris; pedicellis scabris, glumis brevioribus v. subaequalibus; spiculis viridi-violaceis, subfasciculatis, $1\frac{1}{2}$ — $1\frac{3}{4}$ lin. longis; glumis lanceolatis, carina scabris; callo utrinque piloso; palea inferiore glumis $\frac{1}{2}$ brevior, elongata, subcylindracea, truncata, apice 4-mucronulata; arista brevissima, subapicali; palea superiore minima; antheris linearibus, $\frac{3}{4}$ lin. longis.

Hab. in Chile (Gay).

Affinis est *A. magellanica*, differt autem rhizomate, flore, arista et antheris.

10. AGROSTIS (TRICHODIUM) UMBELLATA Colla, in pl. Berteroan. fasc. V. p. 23. sive Mem. Ac. Sc. Torin. XXXIX. p. 23. 1833.

A. caespitosa, 1—2-pedalis; culmis omnibus fertilibus, strictis, laevibus, foliis anguste linearibus, utrinque scabris; ligula oblonga, acuta; panicula laxissima, 3—4 poll. longa, 2—3 poll. lata; ramis setaceis, divaricato-patulis, inferne 3—5-verticillatis, ter quaterque di-trichotome ramosis; pedicellis scabris, capillaribus, 4—12 lin. longis; spiculis $1\frac{1}{2}$ —2 lin. longis; glumis lanceolato-acuminatis, acutis, praeter carinam laevibus; callo breviter piloso; flore glumis fere dimidio brevior, ovato-elongato; palea inferiore 5-nervia, apice truncata et denticulata, superficie scabriuscula, dorso paulo infra summum aristata; arista recta, brevi v. glumas paulo superante; palea superiore brevissima. — Em. Desv. Gram. chil. in Gay Fl. Chil. t. VI. p. 314. — *A. chilensis* Kunze in Poeppig Coll. Chil. III. 21. Trin. in Linnaea t. X. p. 302 (1835) et in Agrost. in Act. petrop. *A. patens* Trin. Agrost. in Act. petrop. sér. VI. nat. t. IV. Bot. p. 322, ex specimine Berteroano! (1841). — *A. stricta* Trin. Agr. l. c. p. 342 ex spec. Berteroan. ejusdem loci, excl. synonym. (1841). — *A. glabra* Hochst. (non Presl.) Mss. in Unio line-rarum (1835) ex spec. Berteroan. n. 556 in Hb. Webb.

Hab. Rancagua (Bertero. n. 31 et 556), Antuco (Poeppig), regni Chil. Em. Desv.

11. AGROSTIS (TRICHODIUM) LEPTOTRICHA Em. Desv. Gram. chil. in Gay Fl. chil. t. VI. p. 316. tab. 76. f. 1.

A. annua, elata, pulcherrima, caespitosa; foliis utrinque scabris, planis, siccitate convolutis; ligula oblonga, apice lacera; panicula 4—6-pollicari, laxissima; ramis longissimis, tenuissime capillaribus, ter quaterque dichotome v. trichotome ramosis, nutantibus, non divaricatis; inferioribus 5—8 verticillatis; pedicellis 3—10 lin. longis; glumis subaequalibus, $\frac{1}{4}$ lin. longis, ovato-lanceolatis, carina denticulato-scabris callo breviter piloso; palea inferiore glumis paulo brevior mucica, dorso convexa, 5-nervia,

nervo medio ante apicem evanescente, apice truncata et 4-mucronulata; palea inf. minima, rotundata.

Hab. Valdivia et Osorno regn. Chil. (Gay, Bridges).

Valde affinis est *A. montevidensi* Spr. sed abunde differt arista, callo, glumis etc.

12. AGROSTIS ADSCENDENS Lange (exs. et mscept. 1851. pug. I. p. 33):

Caespitosa, $\frac{1}{2}$ —1-pedalis, culmis adscendentibus folia canaliculata, apice setaceo-convoluta, ligula elongata demum fissa, dorso breviter et dense pubescens; panicula 1—2 pollicaris, glumae violaceo-tinctae punctis saturatoribus scabrae, flosculus fere longitudine glumarum, palea inferior apice vix denticulata, superiori duplo longior. — Habitus fere Polygonis littoralis. — Willk. et Lge. Prodr. fl. hisp. I. p. 52.

Hab. ad fossas subsalsas prope Olmedo Cast. vet. (Lange) atque pr. Vich. Catal. (Gsta.).

A. scabriglumis differt: Planta repens, 2—3-pedalis culmis erectis, folia plana, ligula glabra, panicula semipedalis flosculus glumis tertia parte brevior, palea inferior superiori triplo longior.

13. AGROSTIS MARITIMA Lmk. (Dict. I. 61):

Stolonifera, culmis strictis rigidis $\frac{1}{2}$ —1' l. basi vaginatis, foliis brevibus patentissimis complicatis rigidis glaucis, panicula contracta thyrsoides compacta flavescens, glumis acutis laevibus, paleis inaequalibus muticis. — Rehb. ic. f. 1436. — Willk. et Lge. Prodr. fl. hisp. I. p. 52. — Agr. alba γ . *maritima* Godr. *Vilfa* *maritima*. PB.

β . *Clementii* Willk. (Prodr. fl. Hisp.): „Culmus teres fere tripedalis; folia involuta teretia pagina superiore glaberrima, ligula lacera; panicula bipollicaris et ultra decomposita spicaeformis subcylindrica lobata: flores mutici.“ Clem. An sp. distincta?

γ . *Pseudopungens* Lange Pug. I. pag. 31. — Willk. et Lge. l. c.: pumila, rhizomate longe repente et radicante; culmi diffusi v. adscendentes ramosi 2—6" l. internodiis abbreviatis; folia convoluto-subulata subpungentia, infima vaginis amplis striatis praedita. Panicula $\frac{1}{2}$ —1" l. — Habitu Sporoboli pungentis haud dissimilis.

Hab. in sabulosis maritimis Hispaniae passim β . circa Pto. de Sta. Maria, Clem. γ . ad litt. Galleciae boreal. pr. Doninnos, Lge.

14. AGROSTIS VULGARIS var. FRONDOSA Lange (Pugill. I. p. 32. exs. n. 32. Willk. et Lge. Prodr. Fl. hisp. I. p. 53.)

Culmi inde a basi ramosi, ramis numerosis, fasciculato-congestis, internodiis brevissimis; foliorum vaginae amplae, laminae horizontaliter divergentes, setaceo-convolutae et apice subpungentes; panicula sub anthesi contracta, post anthesin patula; paleae variant in uno eodemque specimine mutica et arista geniculata basali, glumarum fere longitudine praedita. — Hab. Sporoboli pungentis. — *A. frondosa* Ten.? Trin. ic. I. t. 32. fig. D.?

Hab. in Galleciae montanae et maritimae ericetis frequentissima.

Planta hic commemorata praeter characteres indicatos habitu singulari, ab *A. vulgari* typica prorsus aliena distinguitur, quare forsitan specificè seperanda. Haud male convenit cum *A. frondosae* Ten. descriptione, ad quam ideo ad interim retuli sed an recte, ex icone Triniana haud bona vix dijudicari potest. Si nova *A. scoparia* forsitan appellanda.

15. AGROSTIS SETACEA Curt.

A. biflora Lge. (Willk. et Lge. Prodr. Fl. hisp. I. p. 54. Cf. Lge. pugill. I. pag. 34):

Spiculae biflorae utroque flore aristato. Ceterum cum forma typica convenit.

Hab. in Galleciae monte Pico Sagro pr. Santiago (Lge.)

16. AGROSTIS NEBULOSA Boiss. et Reut. (diagn. 26):

Multiculmis, culmis 1—1 $\frac{1}{2}$ ' l. teneris, foliis planis, ligula oblonga acuta lacera, paniculae amplae verticillato-ramosissimae ramulis scaberrimis, pedicellis laevibus, spiculis minutis pallidis, glumis lanceolatis obtusiusculis glabris, paleis subaequalibus

glumis quadruplo brevioribus, inferiore mutica v. (rarius) a basi aristata. — Sec. Willk. et Lge. Prodr. Fl. hisp. I. p. 51.

Hab. in Hispania in collibus arenosis et gypsaceis utriusque Castiliae (c. Rivas, S. Pablo los montes, in valle Ambles pr. Avila, Reut. Olmedo, Lge.) et Baeticae (la Carlota, Schousb.) passim. ☉. Jul.

17. AGROSTIS CASTELLANA Boiss. et Reut. (Diagn. 26):

Caespitosa, culmis $1\frac{1}{2}$ — $2\frac{1}{2}$ ' l. erectis, gracilibus, foliis planis angustis (siccis convolutis saepe filiformibus) glaucescentibus, ligula alba sublacera, paniculae $\frac{1}{2}$ — $\frac{3}{4}$ ' l. angustae laxae ramis semiverticillatis valde inaequalibus pedicellisque scabris, glumis acutis laevibus pallide virentibus, paleas valde inaequales basi breviter penicillatas superantibus, palea inferiore apice bisetosa supra basin aristam externam valde geniculatam gerente, rarius mutica. — Lge et Willk. Prodr. fl. hisp. I. p. 53.

Abundat in collibus arenosis et dumosis regionis inferior. et montanae Hispaniae: Castellae novae (v. c. pr. Chamartin, Casa del Campo, Guadarrama, Reut., Escorial, Lge.) regni Legion. (c. Bena vente, Villafranca del Biergo, Lge.) 24. Jun. Jul.

18. AGROSTIS NEVADENSIS Boiss. El. p. 61. — Steud. Synops. p. 163.

β. minor Boiss. Voy. II. 646. Culmi 2—3" l. panicula contracta. — Willk. et Lge. Prodr. fl. hisp. I. p. 54.

Hab. β. in regione nivoli ad summas usque ad 9—11000'.

Cacumina Hispaniae (Borreguiles, Boiss., Mulahacen, Willk.). Provenit etiam in reg. alp. Asturiae. — 24. Jul. — Sépt.

19. AGROSTIS REUTERI Boiss. (Voy. II 645): stolonifera, culmis $1\frac{1}{2}$ — $2\frac{1}{2}$ ' l., foliis planis, ligula oblonga, lacera, paniculae amplae patentissimae ramis verticillatis pedunculisque laeviusculis, glumis violaceis acutis glabris, paleis subinaequalibus truncato-denticulatis muticis, glumis demum patentissimis plus dimidio brevioribus. — Ex Willk. et Lge. Prodr. fl. hisp. I. p. 52. — A. capillaris Desf. fl. atl. non L.; A. alba Kz, Chlor. n. 256. non L.

Hab. in Hispania locis herbidis et arenosis humidis regionis inferioris et montanae in regno Grenat, (p. Estepona, Hs. Prol., Malaga Bss., Reut., Sierra Nevada in collibus ad 3500', Wk.) Baetica (pr. Gades, Bss.) atque Estremadura (Badajoz, Schousb.) — 24. Jun. — Aug. „Hens.“ — Etiam in Algeria.

20. AGROSTIS TRUNCATULA Parl. fl. ital. — Willk. et Lge. Prodr. fl. hisp. I. p. 55. — A. capillaris Boiss. et Lge. non L.)

Hab. in pascuis locisque incultis regionis montanae Hispaniae borealis et australis in Gallecia frequentissima (Lge.), per regnum Legion. (Pto. de Manzanal, Villafranca del Biergo. (Lge) et Castell. vet. (Medina de Rioseco, Lge.) haud raro, in Sierra de Guadarrama (supra Chozas, Bourg.) ☉. Jul. — Aug.

21. AGROSTIS CANINA L. — Steud. Synops. p. 162.

α. genuina Godr. Fl. fr. III. p. 484. Folia viridia.

β. glauca Godr. l. c. Folia glauca (A. vinealis Desv.)

γ. humilis Willk. Culmi 3—4" l., panicula contracta et condensata (A. gallica Lag. in herb. Bout.) — Lge. et Lge. Prodr. Fl. hisp. I. p. 54.

Hab. etiam in Hispania γ) in Astur. reg. alpina. (Pico de Arvas, Lag.)

22. AGROSTIS SINAICA Boiss.

— Boiss. diagn. XIII. p. 46. —

A. perennis glabra glaucescens, collo subnodoso, culmo erecto simplici elato, foliis rigidulis erectis linearibus setaeo-acuminatis siccitate convolutis multistriatis, ligula oblonga brevi truncata, panicula erecta contracta oblongo-lineari albida ramulis pedicellis-que strictis abbreviatis scabridis, glumis aequalibus acutiusculis mucronulatis undique sed ad carinam longius scabridis flosculo mutico sesquialongioribus, glumellis glabris exteriori oblonga acutiuscula interiori paulo breviori subtruncata.

Hab. ad aquas jugi Sinaitici Bovè, pl. exs. et in Decaisne. Flor. Sin. No. 41 sub *A. maritima*.

Culmi bipedales, panicula tripollicaris angusta, habitus *A. stoloniferae* a qua glumis undique nec carina tantum scabris, glumella inferiori acuta nec truncata statim dignoscitur. *A. stolonifera* quae glumas quoque hirtulas habet differt radice annua, culmis decumbentibus, ligula fimbriata, foliis planis non rigidis etc. *A. Schimperiana* Hochst., planta Abyssinica cui *A. Simensis* ejusdem regionis ut varietas aristata adjungenda est et quae quoque glumis hirtis gaudet differt glumella calyce vix breviori, foliis teneris planis.

23. AGROSTI · BYZANTINA Boiss.

— Boiss. diagn. XIII. p. 46. —

A. annua? glabra, radice fibrosa subpraemorsa, culmis ascendentibus dein erectis foliosis, foliis brevibus vaginis striatis limbo a basi anguste lineari-lanceolata subulato multinervi superne et marginibus scabro, ligula brevi ovato-subtruncata, panicula erecta valde contracta anguste lineari-elongata virenti ramis 2—3 verticillatis capillaribus strictissimis scabris, pedicellis scabridis apice incrassatis spicula parum longioribus, glumis lanceolatis acutis aequalibus subcarinatis dorso virecentibus obscureque uninerviis caeterum hyalinis carinae apice scabriusculis caeterum laevibus, flosculo glaberrimo mutico, palea inferiori gluma saltem tertia parte minori basi virenti caeterum hyalina apice obtusa minutissime denticulata, superiori hyalina plus dimidio minori apice obtuse bidentata.

Hab. prope Byzantium Noë 1844 sub No. 225.

Planta pedalis, panicula 3—4 pollicaris angustissima, spiculae magnitudinis earum *A. caninae* a qua caeteris neglectis panicula contractiori, flosculis muticis bipalaceis differt. Propius affinis *A. Castellanae* Boiss. et Reut. quae eadem ac *A. effusa* Spreng. (nomen omnino improprium) esse videtur et quae quoque panicula contracta insignis longe differt glumis majoribus acutioribus, flosculis basi hirsutis etc.

24. AGROSTIS (TRICHODIUM) INFIRMA Buse.

Buse in pl. Jungh. III. p. 342.

Paniculae pyramidalis ramis ut et glumarum carinis hispido-scabris, glumella infera mutica, supera subnulla, f. radicalib. setaceis strictis, culmis linearib. scabris, ligula producta saepius incisa, radice fibrosa. —

Hab. ins. Javam. in paludosis pr. pagum Parèkesit in planitie montis Diëng, alt. 6200'. (Jungh.)

Biped., tenera, valde affinis *A. (Trichodio) caninae*. Ab huj. varietate s. forma mutica distinguenda est, praeter radicem, paniculae teneritate, et pedicellis longis. —

25. AGROSTIS (TRICHODIUM) STRICTA Buse.

Buse in pl. Jungh. III. p. 341.

Panic. lanceolatae ram. laeviusculis, spiculis majusculis, glumis carina hispidulis, glumella infera e dorso brevit. aristata supera subnulla, f. glabris, radicalib. linearib. strictis, culmeis latiorib., supremo paniculae propinquo, ligula producta.

Bipedalis.

β . *remota*: f. radicalib. subinvolutis, culmeo supremo a panicula paullum effusa remoto.

Hab. ins. Javae, una cum varietate β in planitie centr. cacuminis Mont. Mandala wangi, alt. 2900. (Jungh.)

817. CALAMAGROSTIS Adans.

(Walp. Ann. III. 756.)

1. CALAMAGROSTIS CHILENSIS Ph. — Lin. XXIX. 89.

C. foliis fasciculorum sterilium 9—10 pollic. longis, erectis, convolutis, laevibus superius glabris, basi vaginatamque ore pilosis; culmis erectis, bipedalibus, gracilibus, basi ramosis, superius nudis; foliis culmeis omnino glabris; ligula satis longa truncata; panicula $4\frac{1}{2}$ -pollicari, subsecunda, contracta; ramis quaternis quinisque, majoribus $1\frac{1}{2}$ pollic. longis; pedicellis capillaribus, spiculas subaequantibus, scabris; glumis $2\frac{1}{2}$ lin. longis, aequalibus, fuscis, lanceolatis, carinatis, glabris, in carina scaberulis; superiore trinervi; pilis gluma brevioribus, flosculo longioribus; paleis membranaceis, hyalinis, inferiore $1\frac{1}{4}$ lin. longa, ovata, hyalina, mutica; superiore tertio brevior.

Specimen a cl. Gay prope thermas Cauqueres lectum in herb. Chil. exstat. — Stamina nulla invenire possum; an species dioica?

2. CALAMAGROSTIS STRIGOSA Hartmann. Skand. Fl. ed. IV. p. 26. vix Steud. Synops. p. 189. n. 34. sed Arundo strigosa Wbg. fl. lapp. n. 47. — Blytt Norges Flora I. p. 86. Hab. in Scandinavia.

3. CALAMAGROSTIS GRACILESCENS Blytt (Norges Fl. I. p. 88).

Rhizoma horizontaliter repens, stolonibus paucis praeditum. Culmi steriles foliiferi, erecti; fertiles graciles, 4-nodosi, 2—3-pedales, sub inflorescentia hispiduli. Vaginae internodiis breviores; ligula brevis summa vix $1\frac{1}{2}$ lineam longa, truncata fissa vel lacera. Folia in culmeis sterilibus fere setacea glabra vel apicem fere pungentem versus parum scabridula. Folia in culmis fertilibus $\frac{1}{2}$ —1 lineam lata, longissime acuminata, scabra. Panicula 3—4-uncialis, obscure purpurea, erecta, sub anthesi aperta, lanceolata, demum contracta, paleis apertis. Rachis scabra. Rami 8-verticillati, in ramulis 3—6 scabros, inaequales divisi. Glumae parum inaequales anguste lanceolatae acutae, carina scabridulae, post anthesin apertae (non divaricatae) Palea pilis sublongiores, tenuiter membranaceae, pallidae nervibus purpureis, inferior ovata, apice tenuiter denticulata. Arista ex medio dorso paleae eaque brevior. — 24. Juli.*

C. densiflora (*C. latifolia densiflora* Bl.). Panicula laxiuscula v. omnino erecta colorata, ramis terminalibus verticillatis.

Hab. in Norvegia.

5. CALAMAGROSTIS RUBICUNDA Blytt Norges Fl. I. p. 91.

Rhizoma plus minus elongatum, repens. Culmi solitarii vel plures simplices v. ramosi, 5-nodosi, 2--3-pedales laeves apicem versus compressi. Vaginae scabriusculae internodia fere aequantes, suprema excepta, quae vulgo internodio 2--3 poll. brevior. Ligulae elongatae, truncatae, fissae et lacerae, summae culmum amplectentes et usque ad 4 lineas longae. Folia sterilia angusta et convoluta, culmea plana, rigida, 3--4 lin. lata, lineari-lanceolata longe acuminata, supra et marg. scabra. Panicula erecta, rigidiuscula, 4--6 pollicaris, pallide purpurea; rachis inferne saepe scabriuscula. Verticilli 6--8, infimi adpropinquati, eorumque rami inferne undulati rigidi, scabri, longiores 2-poll. sub anthesi patentes, demum contracti, glumis clausis. Spiculae 2--2½ lin. longae. Glumae lanceolatae acutae inaequales, major carina scabra. Pili glumam breviorum aequantes. Flosculus pilis breviores; palea exterior apice bifida laciniis bidentatis, superiore duplo longior. Arista in medio dorso infixae paleamque aequans. 2. Jul. Aug. C. Langdorff Fr. H. N. XIII. 89?

Hab. in puludibus, ad rivulos et prope Christianiam Norvegiae.

6. CALAMAGROSTIS NUTANS (Saut.) Rehb. fl. ex. p. 262. Rehb. Icon. f. 1446; Blytt Norges Fl. I. p. 92

Culmi 5--6-nodosi, 3--3½-pedales, rigidi, erecti, teretes superne subcompressi, Vaginae laeviusculae, internodiis subbreviores. Folia subglaucescens, plana, usque ad 4 lin. lata, lineari-lanceolata, longe acuminata supra et marg. scabra. Panicula 4--5-pollicaris, multiflora, subnutans, demum erectiuscula ramis fere unilateraliter contracti, glumis clausis.

A *C. phragmitoidi* et *rubicunda* differt praecipue spiculis minoribus (vix 1½ lin. longis), glumis subaequalibus, lanceolatis, acuminatis; pilis glumam breviorum aequantibus, palea pilos aequante; arista in medio dorso paleam pilosque aequante.

Hab. in Norvegia prope Christianiam; Blytt.

7. CALAMAGROSTIS ELATA Blytt (Norsk fl. p. 148, Norges Fl. I. p. 92):

Rhizoma breve. Culmi numerosi, 6-nodosi, 4--5-pedales. Vaginae internodiis breviores, ut folia glaucae; Ligula 1--6 lin. longa, truncata, lacera. Folia angusta, vix 2 lin. latiora longe acuminata. Panicula 6--8 pollicaris primo rubicunda erecta, demum subargentea et nutans. Verticilli inferiores valde approximati quasi e radiis 12 compositi. Spiculae 2 lin. longae, lanceolatae acutae. Glumae inaequales, carina scabriusculae, demum apertae. Pili glumam breviorum aequantes flosculum superantes. Palea exterior ovata obtusa bifida, laciniis denticulatis, paleam superiorem duplo superans. Arista in medio dorso paleam aequans vel subsuperans. Hb. Skand. Fl. p. 298. *C. phragmitoides* α. major-elata And. Gram. Scand. p. 85. Fr. H. N. XIV. p. 91.

C. pallidiflora: glumis carina pallida viridibus marg. hyalinis acutis; arista supra medium paleae infixae eaque longior.

Hab. prope Christianiam Norvegiae.

8. CALAMAGROSTIS PULCHELLA (Saut.) Rehb. fl. exc. Blytt Norges Fl. t. p. 93. Rehb. icon. 1445. fl. germ. exsicc. 905. (non H. N. XIV. 92 quae forma pallida, C. pseudo-phragmitis).

Culmi a basi vel a geniculis plus minus ramosi v. simplices, 5—6-nodosi, 2—3-pedales laeves. Vaginae striatae, laeves v. scabriusculae, internodiis breviores. Ligula 2—4 lin. longa, truncata fissa. Folia sterilia convoluta, fertilia plana, linearia longe acuminata, scabra, usque ad 4 lin. lata. Panicula erecta, 2—5 poll. longa, apice plus minus nutans, rachi gracili subundulata, ramis capillaribus laxis, sub anthesi ovata. Glumae subaequales, acutae, carina scabriusculae. Pili paleam vix superantes. Arista in medio dorso paleam paullo superans. Perennis, Julio florens.

Hab. in Norvegia, prope Christianiam. Blytt

9. CALAMAGROSTIS ELATA Blytt (Norges fl. I. p. 148):

Rhizoma breve radículas breves graciles condensatas emittens, et culmos plures erectos, crassiusculos, 6-nodosos (nodis obscure coloratis), 4—5-pedales, usque in apicem laeves. Vaginae internodiis breviores, ut folia glaucescentes, laeves. Ligula 1—6 lin. longa, truncata, lacera. Folia angusta, raro 2 lin. latiora, linearia longe acuminata, supra et margine scabra. Panicula 6—8-pollicaris, primo purpureo-cinerea, erectiuscula, post anthesin argentea valde nutans, secunda. Verticilli inferiores approximati ita ut verticillus quasi unus 12-radiatus efficiatur. Spiculae 2 lin. longae, lanceolatae, acutae. Glumae inaequales, carina scabriusculae, demum divaricatæ-apertae. Pili glumam breviorē aequantes, paleam multo pellucidam superantes; palea inferior ovata bifida, laciniis denticulatis, paleam superiorem duplo superans. Arista in medio dorso vel paulum supra medium infixa, glumam aequans vel subsuperans.

C. pallidiflora Blytt l. c. Glumae dorso pallide virentes, marginibus hyalinae magis acutatae. Arista fere supra medium dorsum glumamque superans.

12. CALAMAGROSTIS GLOMERATA Boiss. et Buhse (in N. Mém. de la Soc. des Nat. de Moscou, v. XII. p. 229):

Glaucescens, radice . . . culmo elato laevi, foliis late linearibus margine scabridis ligula elongata lacera; panicula elongata angusta basi subinterrupta spicaeformi virenti, ramis subsessilibus erectis glomerulos densiflore cylindricos ferentibus, glumis subaequalibus anguste lanceolatis acutis viridibus margine rubellis, flosculo basi pilis albis copiosis glumas aequantibus, obsito hyalino glumellis subaequilongis gluma quarta parte brevioribus inferiori medio dorso arista glumas subaequantibus obsita, inferiori bidentata.

Hab. in mont. Albrus in valle Kasan 6—7000 p., 26. Juni 1848.

Planta elata. Panicula 6—8-pollicaris eam *Dactylis glomeratae* quodam modo referens. Ab affini *C. Epigejos* differt panicula valde angusta densiflora, spiculis fere dimidio brevioribus, glumis subaequalibus, culmo laevi.

13. CALAMAGROSTIS DUBIA Bunge (Reliquiae Lehm. in Mém. présent. à l'Académie de St. Pétersbourg VII. 1854. p. 524):

Panicula patula, glumis anguste lanceolatis acuminatis, inaequalibus, pilis florem superantibus, palea inferiore apice integra in aristam aequantem acuminata, superiore plus dimidio brevior rudimento floris secundi nullo.

Hab. inter Buchara et Samarkand, 31. Aug. 1841.

Habitu omnino *C. persicae* Boiss. arista dorsali distincta. A *C. littorea* DC. cui proprior, differt palea inferiore integerrima neque emarginata, arista terminali, neque ex emarginatura egrediente, et habitu graciliore; an *Arundo* glauc. NB.?

Radix longe repens. Culmus cum panicula 2½ pedalis strictissimus, laevis, glaber. Folia fasciculorum sterilium convoluta, caulinarum vaginae scabrusculae inferiores breves laxiusculae, superiores auctae sensim longiores, summa semipedalis a panicula pede dimidio remota; ligula membranacea bifida elongata, longe membranaceo-decurrens; lamina folii patentissima, 3—4-pollicaris linea vix latior, plana, supra scabra. Panicula circiter quinquepollicaris, pollice parum latior, laxa, patula; rami basi nudi, supera ramulosi tenuissimi cum spiculis sesquipollicares, hispido-scaberrimi. Glumae angustissimae, acutae, compressae, inferior 2½ lin, superior 1¾ lin. longae, dorso scabrae. Pili colli duas lin. longi. Palea inferior vix lineam longa, arista parum longior pilos vix excedens, palea superior minutissima. Caetera generis.

318. DEYEUXIA Clarion.

(Walp. Ann. l. 929.)

1. DEYEUXIA VIVIPARA Ph. — Linn. XXIX. 90.

D. caespitosa, pedalis, glabra; foliis margine scabris; paniculam attingentibus; ligula ovata, acuta; panicula erecta, sat laxa, aurea, interdum violaceo mixta; glumis laevibus, lanceolatis, subaequalibus, inferiore uninervia, superiore basi trinervia; palea inferiore, glumam aequante, trinervia, in carina molliter ciliata, inermi, superiore triente brevior, molliter ciliata, bicuspidata; pilis rhachidis dimidiam glumam aequantibus, pedicello sterili in plantulam exescente.

In monte Cerro del doce de Febrero dicto legit cl. Fonk. — Folia radicalia erecta, dimidium culmum aequantia, complicata, sed vix convoluta; caulina 2—3 poll. longa; panicula 2—3 poll. longa; ramis 3—4 in quovis verticillo, hirtis; glumae fere 4 lin. longae; flos' inanis, sterilis.

2. DEYEUXIA VULCANICA Ph. l. c.

D. caespitosa, circa 6-pollicaris; culmo erecto, filiformi; Intermedio ultimo elongato, nudo; foliis radicalibus convolutis, obtusis, vix ½ culmi aequantibus; caulinis acutis, saepe planis; ligula elongata; panicula pollicari, satis laxa; ramulis setaceis hirtis; glumis vix 3 lin. longis, lanceolatis, subtrinerviis, in carina pectinatis; palea inferiore lanceolata, gluma sublongiore, integra, mutica, in carina pectinato-ciliata; flore ipso viviparo.

Ad radicem vulcani de Orsono dicti Februario 1852 legi. — Differt a priore: caule superius nudo, filiformi; foliis radicalibus longe minoribus; glumis brevioribus, una cum palea pectinatis.

3. DEYEUXIA AGROSTIDEA Ph.

D. caespitosa, glaberrima, humilis; culmo ad summum sexpollicari, vaginis laxis, suprema inflata, fere usque ad paniculam involuto; foliis convolutis, filiformibus; radicalibus laevibus, culmorum fertiliu vero scabris; panicula ovata s. oblonga, satis compacta, violacea; pedicellis capillaceis; pilis brevibus, distantibus, obsitis, spiculas bis aequantibus; glumis oblongo-lanceolatis, uninerviis, violaceis, dorso hispido-ciliatis; florem fere bis aequantibus, margine versus apicem lacero denticulato; calli pilis florem aequantibus; flore stipitato; palea inferiore late ovata, apice truncata et irregulariter incisa, subquinquenervia, e basi aristam paleam bis aequantem emitte;

palea superiore hyalina, apice inciso-lobata, pedicello sterili longe barbato, dimidium paleae superioris aequante.

In editissimis Andibus Talcaregue legit cl. Gay. — Habitus *Agrostidis nanae* Knth. Glumae 2 lin. longae.

4. *DEYEUXIA CHILENSIS* Em. Desv. Gram. chil. in Gay: Fl. chil. t. VI. p. 322.

D. caespitosa; vaginis laxiusculis nitidis; foliis setaceis, convolutis, scabrisculis, intus pubescentibus, apice subulato-pungentibus; culmis laevibus, pedibus panicula angusta contracta; pedicellis erectis, glabris; glumis aequalibus; callo breviter piloso; paleis subaequalibus, glumis paulo minoribus, inferiore apice acute biloba et quadridentata, supra basim aristata; arista tortili glumas excedente; palea superiore acute bidentata; pedicello sterili floris dimidium aequante.

Hab. in Cordillera de Ovalle, regn. Chil. (Gay).

5. *DEYEUXIA CHRYSOSTACHYA* Em. Desv. Gram. Chil. in Gay fl. chil. t. VI. p. 323. tab. 78. f. 2.

D. dense caespitosa, culmis 6—12-pollicaribus, laevibus; foliis pallidis, convolutis setaceis, scabris; ligula longa, acuminata; panicula spiciformi, densa, nitide aurea, 1½-pollicari; glumis subaequalibus, lanceolatis, obtusiusculis, apice denticulatis, basi 3-vel sub-5-nerviis, flore ½ longioribus; floris fertilis palea inferiore ovata, subnervia, apice truncata et irregulariter incisa denticulataque, aristam rectam brevemque supra medium vel sub apice fere nullum gerente; palea superiore sublongiore, apice triloba, lobis denticulatis; pilis calli brevibus; pedicello sterili breviter barbato, flore dimidio brevior.

Var. β. Panicula longiore, angustiore, sublobata; spiculis minoribus, olivaceo tinctis; glumis latioribus.

6. *DEYEUXIA ERYTHROSTACHYA* Em. Desv. Gram. chil. in Gay Fl. chil. t. VI. p. 324. t. 78. f. 1.

D. dense caespitosa, culmis 2—5-pollicaribus, laevibus; foliis convolutis setaceis, basi subscabris, apice cartilagineo-scabris; panicula spiciformi, 1—1½-pollicari, purpurascens; glumis subaequalibus, dorso scabris, angustis, acuminatis, flore vix duplo longioribus; floris fertilis palea inferiore ovata, 4-nervia, apice biloba, lobis acute dentatis, paulo supra basin aristata; arista inferne tortili, glumas subaequante; palea superiore inferiore paulo brevior, apice biloba, lobis bidentatis; pedicelli steriles paleis triplo brevioribus, callique pilis paleam aequantibus vel eadem paulo brevioribus.

Hab. in Cordilleris de Talcaregue, provincia de Colchagua regni Chil. (Gay).

7. *DEYEUXIA SETIFOLIA* Hook. fil. (Fl. Nov. Zeland. p. 299. Tab. 65. B.)

Caespitosa, laevis v. scaberula, foliis setaceis filiformibusve, panicula contracta parce ramosa pauciflora, glumis acuminatis carinis scaberulis flore paulo longioribus, palea inferiore basi longe sericea vel glabrata apice truncata 4-cuspidata v. crosa, arista ad medium dorsi inserta glumis ½ longiore incurva, palea superiore brevior 2-dentata setula longe ciliata ½ longiore.

Hab. in Nova Zelandia; northern island: Titiokum, in cacumine montis Ruahine, et Waikare Luke (Colenso.)

Gramen pusillum, caespitosum. Culmus 6—8 poll. altus. Folia culmo breviora vaginis brevibus. Panicula 1—2 poll. longa; spiculae paucae lucidae 1½—2 lin. longae.

821. **ARUNDO** Linn.

(Walp. Ann. III. 757.)

1. *ARUNDO ZOLLINGERI* Büse in pl. Jungh. III. p. 345:

Paniculae amplae longissimae ambitu lanceolatae, rachi magna, ramis capillaribus longis parce breviterque ramulosis; spiculis sub-6-floris, glumis subaequalibus dimidium spiculam longis, glumella supera inferae ¼ aequante, aristis recurvatis.

Hab. ins. Javae Zoll. in herb. acad. Lugd. Bat. (non, ut videtur, in Cat. Moritz) n. 337. (specim. maturum) et no. 380. (specimen virgineum).

Hab. peculiaris, etc.

2. ARUNDO GAYANA Em. Desv. Gram. chil. in Gay: Fl. chil. t. VI. p. 326.

A. foliis subplanis, in marginibus et carina subtus prominente denticulo-scabris; ligula e pilis constante, vaginis apice utrinque pilosis, superioribus subinflatis; panicula 9-pollicari, laxa, nutante, variegata; spiculis 6-9-floris; glumis angustis, basi trinerviis, viridi-violaceis, flores subaequantibus, superiore paulo majore, 8-10 lin. longa; floribus omnibus hermaphroditis; inferioris palea inferiore usque ad aristae tortae et fere aequilongae ortum 5-lineari, elongata, apice bicuspidata, viridi-violacea, 5-nervia, basi usque ad $\frac{1}{2}$ longitudinis suae pilis argenteis 2-linearibus hirta; superiore fere $\frac{1}{2}$ minore, obovato-elongata, truncata; antheris 3, linearibus stigmatibusque elongatis flavescentibus.

Habitat in locis humidis provinciae Valdiviae; rara (Cl. Gay.)

824. **PHRAGMITES** Trin.

(Walp. Ann. III. 757.)

1. PHRAGMITES ROXBURGHII N. ab E. in Meyen ap. post. p. 173. — *Arundo Roxburghii* Kth. agr. p. 218. — Buse in pl. Jungh. III. p. 344.

β . *coarctata* Buse; gluma infera superam $\frac{1}{4}$ aequante. — Hab. ins. Sumatram pr. Padang. (Jungh.) — Panicula capillaris, etc.

2. PHRAGMITES DISTICHA Buse in pl. Jungh. III. p. 344:

Panicula contracta, spiculis sub 5-floris, virgineis anguste linearibus, glumis anguste lanceolatis subaequalibus, glumella supera lanceolata inferam $\frac{1}{3}$ aequante, fol. distichis margine subintegro.

Hab. ins. Sumatrae, ad ripas rivuli K. Lumut. (Jungh.)

Planta magna, speciosa; f. lata, vaginae longissimae internodia multum superantes.

Hab. in Cordilleras altis de Talecague, prov. Colchagua regn. Chil. (Gay).

13. TRisetum (EUTRisetum) LASIOLEPIS Em. Desv. Gram. chil. in Gay fl. chil. I. VI. p. 346.

T. caespitosum, culmis stricte erectis, pedalibus, glabris, apice puberulis, inferne 2-nodis; vaginis glabris, basi puberulis; ligula truncata; foliis angustis, 1—2-pollicaribus, planis v. plicatis, glabris, margine scabris; panicula lineari, bipollicari, spiciformi, macra, viridi-purpurascens; ramis puberulis; spiculis $2\frac{1}{2}$ lin. longis, subtrifloris; glumis ovatis, obtusis, dorso scabris, inferiore 1-, superiore 3-nervia; floris inferioris palea inferiore hispida, dorso viridi-fusca, sub-4-nervia, margine et apice bimucronato-scariosa, supra medium arista refracta, ipsius longitudine, praedita; palea superiore in flore inferiore paulo brevioris, in superiore paleam inferiorem aequante; antheris ovatis, $\frac{1}{2}$ lin. longis.

Hab. in Chile (Gay). Nova forma fertilis Triseti Preslei.

14. TRisetum (EUTRisetum) CHROMOSTACHYUM Em. Desv. Gram. chil. in Gay: Fl. chil. t. VI. p. 350.

T. 3-pedale, robustum, erectum, culmo sub nodis villosis pubescente; vaginis foliisque lato linearibus, 5-8-pollicaribus, molliter utrinque pubescentibus; panicula $4\frac{1}{2}$ -pollicari, spicaeformi, basi lobato-interrupta, obscure viridi; spiculis dense congestis, sub-5-floris, $3\frac{1}{2}$ lin. longis; floribus patulis; glumis inaequalibus, inferiore anguste lineari, superiore trinervia, ovato-acuta, mucronata; palea inferiore glabra, 3 lin. longa, elongata, dorso chartacea, teretiuscula, punctulata, apice acuto bicuspidato, ad bis tertiam partem aristata; arista divaricata, ipsius longitudine; palea superiore inferioris $\frac{2}{3}$ attingente, acute bidentata; antheris linearibus, luteis, $\frac{1}{2}$ lin. longis.

Hab. in campis prope Santiago (Gay).

15. TRisetum (EUTRisetum) VARIABLE Em. Desv. Gram. chil. in Gay: Flora chil. t. VI. p. 351.

T. 1-2-pedale erectum culmo 2-3-nodo; nodis glabris; foliis planis, lineari-acuminatis margine scabris vaginisque glabris vel puberulis; panicula spiciformi, contracta, 2-3-pollicari, nitida, viridi-straminea vel lutescente; spiculis sub-3-4-floris, $2\frac{1}{2}$ -3 lin. longis, floribus erectis; glumis inaequalibus, inferiore anguste lineari, superiore trinervia, ovato-acuta, spicula brevior; palea inferiore $2\frac{1}{2}$ lin. longa, elongata, dorso chartacea, teretiuscula, tuberculato-asperata, in apice acuto bimucronato marginibusque scariosa, ad bis tertiam partem aristata; arista divaricata, ipsius longitudine; palea superiore inferiore paulo brevior; antheris ovatis, $\frac{3}{8}$ lin. longis.

Var. α . *flavescens*. Glumis spiculas flavescentes fere aequantibus; panicula densa.

Var. β . *virescens*. Glumis spiculis nitide virescentibus $\frac{1}{3}$ brevioribus; panicula angusta, sublobata.

Hab. in regno chil. Valparaiso (Bertero. n. 998), Guanegue, prov. Valdivia (Gay), Calbuco, Chiloe (Gay). Valde affine T. subspicato, affinius tamen Avenae phleoidi D'Urv.

16. TRisetum (KOELERIA) MICRATHERUM Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 352.

T. glaucum, pedale, culmis erectis, usque ad apicem foliosis; vaginis pubescentibus; foliis angustis, linearibus, planis intus pubescentibus; panicula angusta, laxiuscula, $2\frac{1}{2}$ -pollicari, colore viridi-glaucum et albido variegata; spiculis subtrifloris, $2\frac{1}{4}$ lin. longis; glumis valde inaequalibus, inferiore anguste lineari, acuta, vix 1 lin. longa; superiore trinervia, elliptico-elongata, acuta, spicula brevior; palea inferiore elongata, trinervia, glabra, dorso viridi, paulo sub apice scarioso et obtuse bilobo breviter aristata; arista recta, vix lineam longa; antheris ovato-elongatis, $\frac{1}{4}$ lin. longis.

Hab. locis graminosis Rio-Bueno, prov. Valdivia regni chil. (Gay).

17. TRisetum LITORALE Ph. Linn. XXIX. 92.

T. glabrum; culmo erecto, gracili, 1-2-pedali; foliis radicalibus 6 poll. longis, superioribus vaginas suas aequantibus, $2\frac{1}{2}$ poll. longis, 2 lin. latis, margine ciliatis; ligula brevi, subovata; panicula erecta, contracta, tripollicari; spiculis trifloris, 5 lin. longis; glumis inaequalibus; inferiore anguste lineari, uninervia, superiore trinervia, ovato-acuta; palea inferiore pilosa, $3\frac{1}{2}$ lin. longa, sub apice bicuspidato aristata, arista contorta, glumam aequante.

In lapidibus maritimis prope Coquimbo legit cl. Gay. Herb. chil. no. 148.

Differt a Tr. antarctico nodo infimo glabro, foliis ciliatis, paleis hirsutis; spiculis 5 lin. longis; a chromostachyo glabritie; spiculis laxis, paleis hirsutis; a variabili foliis ciliatis, panicula laxiore, spiculis 5 lin., nec $2\frac{1}{2}$ -3 lin. longis.

Variat caule humili, e basi ramos 3-4 quadripollicares emittente.

18. TRisetum ANDINUM Ph. l. c.

Tr. culmo 9-12-pollicari erecto, inferius glaberrimo, flavo, superius nudo, pubescente, purpurascente; nodis omnibus occultis; vaginis glaberrimis striatis; foliis pla-

nis, brevibus, (supremo 1 poll. longo) superius margineque scabris; ligulis brevibus, dentato-ciliatis; panicula contracta, vix $1\frac{1}{2}$ poll. longa, ramis pubescentibus; spiculis $2\frac{3}{4}$ lin. longis, 2—3-floris, viridi, fulvo, purpureoque variegatis; glumis glabris spiculas haud aequantibus, inaequalibus, superiore fere 2 lin. longa, inferiore brevior, utraque ovato-lanceolata, basi trinervia; margine lato scarioso; carina serrato-ciliata; palea inferiore glaberrima, $2\frac{3}{4}$ lin. longa, bicuspidata, ad $\frac{2}{3}$ aristata, arista divaricata longitudine paleae; palea superiore aristae insertionem superante, acute bidentata.

In Andibus prope Antuco invenit cl. Gay. Herb. chil. no. 210.

Differt a *Tr. toluicensi* culmo superius modo pubescente, haud villosa; foliis brevioribus, spiculis minoribus, glumis eas haud excedentibus, magis inaequalibus.

19. TRISETUM CHILOENSE Ph. l. c.

Tr. culmo erecto seu adscendente, 9-pollicari, gracili, glaberrimo; internodio ultimo longissimo; foliis culmorum sterilibus pubescentibus, ciliatis; vaginis foliisque culmorum fertilibus glabratis; foliis brevibus, supremo vix pollicem longo; panicula fere 2 poll. longa, pauciflora, angusta, laxa; spiculis $2\frac{3}{4}$ longis, 3— $3\frac{1}{2}$ -floris, variegatis; glumis inaequalibus; inferiore lanceolata, uninervia, dorso laevi; superiore late ovata, subquinque-nervia, dorso serrato-ciliata, $2\frac{1}{2}$ lin. longa; palea inferiore glaberrima, fere 2 lin. longa, enervia, apice acuto bicuspidata, ad $\frac{2}{3}$ aristata, arista divaricata, longitudine paleae; palea superiore aristae insertionem superante, acute bidentata.

VENTENATA Koel.

(Endl. gen. pl. n. 863. sub *Trisetum*.)

In pascuis insulae Chiloe, ad Castro a cl. Gay lecta est. Herb. no. 147.

Differt ab antecedente culmo multo graciliore, glaberrimo; panicula pauciflora laxa, glumis valde inaequalibus, floribus minoribus.

1. VENTENATA SUBENERVIS Boiss. et Balansa (Pl. Or. exsicc. no. 7. et app. Coss. et Dur. Fl. Alger. t. II. p. 104. in adnot). Bulletin de la Société botan. de France 1857 p. 305.

Affinis *V. dubiae* Coss. et DR., sed facile distinctu glumis sensim attenuatis, glaberrimis, inaequalibus.

Hab. in locis montosis et aridis regni chil. Santiago (Gay), San Antonio (Gay), San Fernando (Gay), Bancagua (Bertero., n. 30. et 271.).

864. **AVENA** L.

(Walp. Ann. II. 767.)

Classification des espèces du genre *Avena* du groupe *Avena sativa* (*Avena*, *Avenatypus*)
Bulletins de la Soc. bot. de France I. (1854) p. 11.

Avenatypus Coss. et Germ. Fl. par. 636.

Plantae annuae foliis planis. Spiculae vulgo majusculae, pendulae saltem post anthesin. Glumae 7—11 nerves.

Subsectio I. Sativae. Flosculae in rachiola non articulatae nec denique solutae.

1. AVENA SATIVA (L. sp. 118):

Panicula ramis undique diffusis; glumis subaequalibus; flosculo inferiori sessili; palea inferiore 2—3-dentata v. apice breviter bifida, arista inferne contorta. — Vulgatissime culta, nonnumquam subspontanea.

2. AVENA ORIENTALIS (Schreb. Spicileg. 52):

Panicula angusta, unilaterali; glumis subaequalibus; flosculo inferiori sessili; palea infer. 2—3-dentata v. apice breviter bifida, arista flexuosa nec inferne contorta. — Ut species praecedens vulgo culta, rarius subspontanea.

3. AVENA STRIGOSA (Schreb. Spicileg. 52):

Glumis parum inaequalibus flosculos subsuperantibus; flosculo inferiore stipitato; palea inf. apice bifida, laciniis in aristas elongatas pro-

ductis, glabra v. dorso plus minus pilosa, arista inferne contorta. —
Culta et passim spontanea.

4. AVENA BREVIS (Roth Abhandl. 43, Tent. fl. Germ. I. 40):

Glumis parum inaequalibus flosculos fere aequantibus; flosculo infer. stipitato; palea infer. apice bidentata, glabra v. dorso plus minus pilosa, arista inferne contorta. — Rarius culta, passim inter segetes.

Obs. *A. uniflora* Parlat. ap. Webb. phyt. Can. sect. III. 401. t. 278.) nobis forma tantum uniflora videtur hujus speciei sat variabilis. Insulae Canarienses ita forsans patria *A. brevis*.

5. AVENA NUDA (L. sp. 118):

Glumis flosculos non aequantibus; flosculo infer. subsessili, superioribus longe stipitatis; palea infer. membranacea ut in glumis nervis 9—11 distinctis percursa, non coriacea ut in speciebus aliis hujus sectionis. — Passim culta, raro subsponsanea.

Subsect. II. Agrestes. Flosculus inferior in rachiola articulata et inde facile maturitate soluta.

a) *Biformes*: flosculae inaequales; inferior nempe articulata et solubilis, ceterae non articulae nec demum deciduae.

6. AVENA VENTRICOSA Balansa (pl. Alger. exsicc. n. 557).

Glumis parum inaequalibus; palea inferiore flosculi inferioris basi in callum attenuata calcariformem subulatum cicatrice lineari perangusta impressum.

Locis incultis Algeriae.

7. AVENA STERILIS L. (sp. 118):

Glumis fere aequalibus; palea inferiore flosculi inferioris callo brevi cicatrice lata ovali suborbiculari impresso.

In regione mediterranea.

8. AVENA ERIANTHA DR. (apud Duchartre Rev. bot. I. 360 et in Explor. sc. Alger. t. 41. f. 3):

Glumis inaequalibus, inferiore subduplo brevioribus; palea inferiore flosculi inferioris attenuata in callum calcariformem subulatum cicatrice lineari-elliptica apice villosa et bifida lobis obtusis impressum.

Locis incultis Algeriae occidentalis et orientalis.

Var. *acuminata*: palea inferiore apice glabr. scente et aristas 2 longis terminata.

b) *Conformes*: flosculi omnes conformes, cum rachiola articulatae.

9. AVENA LONGIGLUMIS DR. (apud Duchartre Rev. botan. I. 359 et in Explor. scient. Alger. t. 41. f. 1):

Glumis fere aequalibus, flosculos longe superantibus; palea inferiore attenuata in callum calcariformem subulatum cicatrice lineari apice bifida lobis in aristas elongatas productis impressum.

In Hispania australi, Algeria occidentali.

10. AVENA CLAUDA DR. (in Duchartre Rev. bot. I. 360 excl. syn. et in Expl. sc. Alger. t. 42. f. 2):

Glumis inaequalibus, inferiore fere duplo breviori; palea inferiori attenuata in callum linearem fere obtusum, cicatrice elliptica apice bifida lobis in aristas elongatis impressum.

In Algeria, Graecia.

Var. *eriantha*; palea inferiore apice (basi?) villosa. — Haec varietas *A. eriantham* simulat a qua facile tamen distinguitur articulatione flosculi.

11. AVENA HIRSUTA Roth Catal. bot. (*A. barbata* Brot. — *A. hirtula* Lagasc. — *A. atherantha* Presl.).

Glumis fere aequalibus, flosculos parum excedentibus; palea inferiore callo lineari sat brevi fere obtuso cicatrice lineari-oblonga, apice bifida, lobis in aristas elongatas vulgo productis impresso.

In regione mediterranea, in Europa centrali rarior.

(Walp. Ann. I. 935.)

1. **ARRHENATHERUM ERIANTHUM** Boiss. et Reut. p. 121. — Willk. et Lange Prodr. fl. hisp. I. p. 70. — *A. avenaceum* Boiss. Voy. non PB. *A. bulbosum* Kze. non Schtdl. *Avena hispanica* Lge. pug. 41.

Differt ab *A. elatiori* panicula longiori (4—7" l.). Spiculis majoribus, praecipue arista floris masculi e basi paleae inferioris prodeunte et flore hermaphrodito toto excepto apice adpresse longeque hirsuto.

Hab. in rupestribus, dumetis ad sepes regionis infer. et mont. Hispaniae centralis et australis. Etiam in Algeria et Lusitania.

2. **ARRHENATHERUM PALAESTINUM** Boiss. diagn. XIII. p. 51.

A. radice fibrosa ad collum tubera globosa superimposita ferenti, foliis glabris linearibus planis, ligula breviter ovata lacera, culmis erectis, panicula elongata composita anguste pyramidata ramis elongatis flexuosis nutantibus, glumis stramineis glabris dorso scabridis inferiori breviori angustiorique, flosculis binis basi hirsutis inferiori sessili paulo supra basin arista inferne tortili eo 2½ plo longiori aucto hirtulo marginibus ciliato, superiori pedicellato infra apicem arista brevi recta instructo toto ad aristae insertionem usque adpresse et longe hirsuto.

Hab. in Palestina loco non notato. Boiss. 1847.

Planta 2—3 pedalis, panicula 7—9 pollicaris ramis inferioribus saepe bipollicaribus. Ab *A. bulboso* flosculo superiori longe hirsuto facile distinguendum. Ab *A. eriantho* B. et R. quod eodem caractere gaudet ut videtur specificè distinctum paniculae amplae compositae ramis elongatis inferioribus subnutantibus.

871. **DANTHONIA** Dc.

(Walp. Ann. III. 769.)

1. **DANTHONIA SUBULATA** Hook. fil. (Fl. Tasmaniae II. p. 121. tab. 161 B.):

Foliis brevibus filiformi-setaceis vaginisque patentim hispido-pilosis demum glabratiss, culmis gracillimis, panicula brevi erecta subsimplici pauciflora (purpurea), glumis sub-5-floris, palea inferiore basi medioque dense barbata pilis brevioribus, aristas lateralibus gracilibus palea duplo longioribus ultra glumas exsertis, intermedia paulo longiore gracili subtorta. — An *D. setacea* Br.? (Gunn. 1456.)

Hab. in Tasmania: Georgetown et Launceston (Gunn), Richmond (Oldfield) et in Victoria Novae Hollandiae.

Gramen pusillum, gracile, dense caespitosum. Folia 2—3 poll. longa. Culmi usque ad 15 poll. alti, gracillimi; panicula 1—2 poll. longa; spiculae 5—7-florae.

2. **DANTHONIA PAUCIFLORA** Br. (Prodr. 177). Steud. Synops. p. 246. Hook. fil. Fl. Tasman. II. p. 121. tab. 162. A.

Hab. in Tasmania et Victoria Nov. Holl.

3. **DANTHONIA NERVOSA** Hook. fil. (Fl. Tasman. vol. II. p. 121. tab. 163. A.)

Scaberula vel glabra, spiculis racemosis, glumis obtusiusculis erosis inaequalibus inferiore basi 3-nervi superiore 5-nervi, flosculis basi villosis, palea inferiore scaberula coriacea 7-nervi bifida apicibus erosa dorso supra medium arista tortili elongata, superiore bidentata. — *Avena? nervosa* Br. Prodr. 178. — *A. hydrophila* F. Muell. ms. — *Amphibromus nervosus* Nees. in Hook. Lond. Journ. Bot. II. 420. — *A. Nesii* Steud. Synops. p. 328. — *A. junceus* Nees in Hb. Lindl. (Gunn. 1793, 995).

Hab. locis uliginosis Tasmaniae (Formosa Gunn.) et Novae Holl.: New South Wales, Victoria, Swan River.

Gramen altum, gracile. Culmi laxiusculi 2—3-pedales, foliosi. Folia longa, plana, ligula elongata, membranacea, acuta. Panicula v. potius racemus nutans, superne

ramis scabris divisa. Spiculae pallide virides, fere $\frac{1}{2}$ pollic. longae. Flosculi pedicellati, circa 5, teretes, glumis multo longiores.

4. DANTHONIA AUCHERI Hook. fil. (Fl. Tasman. II. p. 122. tab. 172. b.):

Panicula nutante, glumis 2—4-floris coloratis apice acutis erosis, floribus basi villosis, palea inferiore scaberula laciniis brevibus subintegriss muticis vel aristatis. (Gunn. 995.)

Hab. in parte boreali Tasmaniae (Gunn); Cheshunt (Aucher). Floret Decemb.

Panicula quam in *D. nervosa* latior, ramis inferioribus verticillatis; spiculae floribus paucioribus instructae, palea inferior glabrior laciniis saepe in aristam rectam, subulatam, nigram productis.

5. DANTHONIA ANTARCTICA Hook. fil. (Fl. New Zeel. p. 302):

Elata, rigida, culmis basi crassis, foliis culmo longioribus crassis coriaceis inferioribus basi intus sericeis, ligula villosa, costa valida, panicula maxima effusa, ramis elongatis, pedicellis sericeis, spiculis (magnitudine variis) 4—7-floris, albis nitidis, glumis inaequalibus, flosculis distantibus multo brevioribus acutis apice integris erosis bidentatis, palea inferiore sericeo-villosa bifida, arista recta v. recurva palea duplo longiore basi compressa. — *Bromus antarcticus* Hook. fil. Fl. ant. p. 97. t. 54. *Arundo flavescens* Banks et Sol, Mss.

α . *elata*: culmis validis, foliis coriaceis latiusculis intus basi sericeis, panicula densiflora, spiculis majusculis.

β . *laxiflora*: elata, culmis foliisque ut in var. α ., panicula rariflora, — *Agrostis pilosa* A. Cunn. fid. Herb. Heward, non Rich. Flor. (Hook. fl. New Zeal. t. 69 A.) — *A. latior* Steud. Synops. p. 174.

γ . *parviflora*: spiculis minoribus sparsis.

δ . *minor*: glaberrima, culmis brevioribus, foliis setaceo-involutis, panicula pauciflora.

Hab. in Nova Zelandia: Northern et Middle Island (Banks et Sol.), in cacumine mont. Rualine (Colenso, Sinclair etc.). Var. γ . Southern Island (Lyll).

6. DANTHONIA BROMOIDES Hook. fil. (fl. New Zeal. p. 303. t. 68a.):

Glaberrima, foliis culmo longioribus involutis, collo barbato, panicula lanceolata, contracta, ramis pubescentibus, spiculis magnis 6-floris, flosculis glumis ovato-lanceolatis acutis multo longioribus supremis incompletis, rachi villosa, palea inferiore dorso basi que sericeo-pilosa superne puberula apice breviter bicuspidata, arista recta basi plana palea subduplo longiore, palea superiore carinis scabris, avario glaberrimo, squamulis obovatis ciliatis.

Hab. in Nova Zelandia: Northern Island (Stephenson).

Ceteris speciebus dissimilis, habitu potius Bromi mollis ad ovarium omnino glabrum videtur. Culmus pedalis; panicula 4—5 pollices longa; spiculae flavo-virescentes, non lucidae, $\frac{3}{4}$ poll. longae, 6—7-florae.

7. DANTHONIA PILOSA R. Br. Prodr. 177. Steud. Synops. p. 245. Hook. fl. New Zeal. p. 303 et fl. Tasm. p. 120,

D. Gunniana Nees. Steud. Synops. p. 245.

Hab. in Nova Zelandia: Northern et Middle Island: Bay of Island etc. (Sinclair etc.); Canterbury (Lyll).

8. DANTHONIA GRACILIS Hook. fil. (Fl. New Zeal. p. 303. t. 69 B):

Foliis filiformi-setaceis culmisque gracilibus patentim pilosis, panicula subsimplici elongata contracta pauciflora, glumis sub-4-floris flosculis longioribus, palea inferiore basi medioque villosa, fasciculis superioribus pilorum elongatis paleam occultantibus, aristis lateralibus paleae aequilongis gluma brevioribus, intermedia gracili breviter exserta.

Hab. in Nova Zelandia: Middle Island; in campis, et Motucha Valley, prope Nelson (Monro)

D. pilosae valde affinis, similiter pilosa sed gracilior, foliis longioribus. Panicula valde angusta; palea inferior supra medium fasciculo denso pilorum longo et aristis tribus instructa.

- 9 DANTHONIA SEMIANNULARIS R. Br. (Prodromus p. 177). — Labill. Fl. Nova Holl. v. 1. p. 26. t. 33. Trin. sp. Gram. v. 5. t. 52. Hook. fil. fl. New Zeal. p. 304.

α. breviseta: foliis setaceis, aristis lateralibus paleam aequantibus, intermedia aequilonga v. paulo longiore.

β. Unarede Raoul (Choix de plantes p. 11. t. 4): foliis latoribus involutis, aristis lateralibus paleam aequantibus, intermedia glumis $\frac{1}{2}$ longiore. — Steud. Synops. p. 246.

γ. setifolia: foliis setaceis, panicula effusa pauciflora, aristis lateralibus paleam aequantibus intermedio glumis longiore.

Hab. in Nova Zelandia: Northern et Middle Island, *α.* et *β.* copiose (Cunningham etc.), *γ.* in montosis (Colenso); Gordons Nob, prope Nelson (Monro).

10. DANTHONIA COLLINA Ph. Linn. XXIX. 96.

D. culmis erectis, trinodibus, glabris; foliis vaginisque longe pilosis, radicalibus convolutis, setaceis, tertiam culmi partem aequantibus; vaginis foliorum caulinarum elongatis, ore dense pilosis; ligulis superioribus elongatis; foliis supremis vix pollicaribus; panicula contracta, spiculis 10—15 formata et glumis calycinis subaequalibus, lanceolato-subulatis, flosculos superantibus, fulvis, interdum violaceo-tinctis, inferiore distincte trinervia; flosculis circa 3, palea inferiore 5 lin. longa usque ad medium et profundius partita, bicuspidata, pilis longis albis, palea vix brevioribus undique cincta; arista 6 lin. longa.

In collibus apricis praedii mei S. Juan habitat. — Folia radicalia 4—6 poll. longa; nodi castanei, panicula $2\frac{1}{2}$ —3-pollicaris; glumae 7 lin. longae, paleae 4 lin. longae, nempe 2 lin. usque ad insertionem aristae. — Differt a *D. picta* Nees, quacum vaginis pilosis convenit, paleis 4—5 lin. longis, vix nervosis, nec $3\frac{1}{2}$ lin. longis, 9-nerviis, arista 6 lin. nec modo 4 lin. longa, panicula ampliore etc.

11. DANTHONIA CHILENSIS Em. Desv. Gram. chil. in Gay Fl. chil. t. VI. p. 360. tab. 80. f. 3.

D. caespitosa, culmis erectis, simplicibus, gracilibus, 1—2 pedalis; vaginis glabris, ligula pilosa; foliis convolutis, basi pilosis; panicula angusta; spiculis 3—6, 3—5-floris, viridi-violaceis; glumis aequalibus, linearibus, 5—6 lineas longis; callo florum elongato, compresso, utrinque breviter albo-piloso, pedicellum obtegente; palea inferiore obovato-elliptica, in marginibus involutis albo-pilosa, ceterum glabra, dorso virescente, 5—7 nervia, apice membranacea, biloba, lobis triangularibus in setam desinentibus, inter lobos arista 3 lineas longa inferne plana et tortili praedita; palea superiore obovato-spathulata, integra. —

Hab. in Chile (Gay). Valde aff. est *D. sericeae* Nutt.

12. DANTHONIA VIRESCENS Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 363.

D. culmo erecto, 15-pollicari; nodis brevibus, atris; vaginis foliisque convolutis glabris, culmum dimidium superantibus; ligula pilosa; panicula bipollicari, subpatula, nitida, virescente; glumis spiculas 2—3-floras $\frac{1}{3}$ superantibus, subaequalibus, carina viridibus, basi 5-nerviis, 7—8 lin. longis, a basi lanceolata longe acuminatis; rachaeis articulis glabris; palea inferiore ovato-elliptica, 9-nervia, usque ad aristam $1\frac{1}{2}$ lin. longa, inter lobos lanceolatos longe setigeros aristam $4\frac{1}{2}$ —5 l. longam, planamque gerente, triplici serie pilorum cincta; pilis superne in decem fasciculis aggregatis, superioribus genu aristae attingentibus; palea superiore elongato-obovata, apice tridentata, aristae insertionis locum multum superante.

Hab. in Chile, (Gay). Affines sunt *D. unarede*, *D. pilosa* et *D. semiannularis*, qui differunt spiculis 5—6-floris, paleis inferioribus basi valde angustatis, palea superiori nunquam tridentata

13. *DANTHONIA VIOLACEA* Em. Desv. Gram. chil. in Gay fl. chil. VI. p. 365. tab. 80. f. 1.

D. caespitosa, culmis erectis, pedibus et ultra; vaginis foliisque convolutis, glabris, ore utrinque pilosis; ligula brevi, pilosa; panicula sesqui-pollicari, densiuscula, anguste ovata, variegato-violacea, spiculas 20—40 habente; spiculis 2—3-floris, adjectis 1 u. 2 sterilibus; glumis subaequalibus, carina viridi subtrinervia, 4 lineas longis; pedicellis glabris; palea inferiore ovato-elliptica, subcylindracea, usque ad aristam 1 lin. longa, 9-nervia, triplici serie pilorum basi, supra basim et sub arista cincta, basi breviter callosa, apice inter lobos 2 lineares, apice longe setigeros aristam $3\frac{1}{2}$ lin. longam sub geniculo tortam fulvamque gerente, palea superiore angusta

Hab. in Chile (Gay).

14. *DANTHONIA AUREO-FULVA* Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 362. tab. 80. f. 2.

D. caespitosa, humilis, 4—5-pollicaris, culmis filiformibus; vaginis foisque setaceo-convolutis, brevibus, recurvis, pilosis; ligula brevi, pilosa; panicula angusta; spiculis 4—7-virescenti et aureo-fulvo variegatis, 4—7 floris; glumis aequalibus, 4—5 lin. longis, spicula brevioribus; callo florum elongato, compresso, utrinque albo-piloso, pedicellum amplectente; palea inferiore obovato-elliptica, inferne in marginibus involutis albo-pilosa, ceterum glabra, dorso virescente, 5-nervia, apice membranacea, biloba, lobis triangularibus in setam deinentibus, inter lobos arista aureo-fulva 3 lin. longa praedita.

Hab. in Chile (Gay). Proxima est *D. chilensi*.

871 $\frac{1}{2}$. **TRICHONEURA** Ands. (nov. gen.)

(En. pl. ins. Gallopagos p. 148; Eugenie Resa p. 148.)

Spicae racemose paniculatae, spiculae distichae alternae solitariae v. geminae, altera sessilis altera pedicellata. Glumae 2 bracteiformes carinatae membranaceae, flores aequantes acutatae, inferior 3-nervia carinata, ex ap. biloba aristata, in nervis marginalibus pectinato-ciliata. Lodiculae angustae lineares truncatae. Stamina 3. Ovarium elongatum obconicum glaberrimum. Styli 2, terminales. Stigmata penicelliformia, pilis simplicibus.

Est genus distinctissimum inter *Leptochloam* et *Danthoniam* prorsus medium.

1. *TRICHONEURA HOOKERI* And. l. c. p. 149.

Viscida, pilis et tuberculis minutis ortis undique scabra; paniculae ramis strictis simplicibus spicatis; spiculis 5—7 floris, palearum nervis lateralibus longissime ciliatis. *Calamagrostis pumila* Hook. transact. cf. Lin. sec. XX. p. 176.

Hab. locis maxime sterilibus, ins. Albemarle et Chatham (Ipse).

1. *TRIPOGON EXIGUUS* Buse. — Buse in pl. Jungh. III. p. 353.

Spica virginea secunda, florente disticha, spiculis 5—7 floris, fl. tabescentibus superioribus nonnullis; f. linearibus, canaliculatis, pilis raris obsitis; staminibus . . . ?

Hab. insulam Javae in apricis siccis reg. supremae montis Lawu, alt. 10000 (Jungh.) Vix palmaris, etc.

Tribus X. FESTUCACEAE Knth. Gr.

MACROBLEPHARUS Ph. novum genus *Festucearum* (μακρός longus, βλέφαρον ciliae).

(Linnaea XXIX, 100.)

Flores paniculati; panicula contracta, spicaeformis, lobata; spiculae minutae, compressae, octo- v. multiflorae; floribus distichis, patentibus; glumae duae, carinatae muticae; paleae duae membranaceae, glumis sublongiores, inferior ovata, subtruncata, mucronata, trinervia, nervo medio basi setis erectis brevibus armato, lateralibus margini approximatis, scabris; palea superior parum brevior, bicarinata, carinis longissime ciliatis; stamina . . . ; stigmata duo sessilia; caryopsis ovato-lanceolata, teres, glaberrima, intense rufa.

Genus ciliis longissimis carinarum paleae superioris primo aspectu cognoscendum.

1. **MACROBLEPHARUS CONTRACTUS** Ph. l. c.

Annuus (?), culmos steriles fertilesque simul emittens; folia radicalia nulla; culmi erecti, graciles, 1—1½-pedales, basi ¾ lin. crassi, trinodes; vaginae glabrae, ad os et praesertim ad ligulam longe pilosae; ligula subnulla; folia plana, 1—1¼ lin. lata, glabra; superiora longiora, fere 5 poll. longa; panicula ¾ poll. longa, interrupte lobata; rami plerumque singuli, modo 4 lin. longi; spiculae ¾ lin., glumae modo ½ palea major ¾ lin. longa.

In valle de Limari dicta detexit cl. Gay. Herb. Chil. n. 129.

SESLERIACEAE Koch Synops. ed. 2. p. 910.

Ueber die Sesleriaceen der Flora von Siebenbürgen, von Dr. Ferd. Schur, in Verh. des zool.-bot. Vereins in Wien. 1856. p. 191.

Inflorescentia panicula contracta, capitata v. ovoidea, raro elongata et spiciformis, basi ochreola suffulta vel, in *Oreochloa*, destituta. — Spiculae compressiusculae 2—3-florae. Flores hermaphroditi flosculo supremo interdum abortiente. Stylus brevissimus. Stygmata longissima filiformia ex apice floris emergentia. Glumae valvis magnis flores fere tegentibus. Palea inferior obtusa, 3—5-dentata (dentes mucronatae vel aristatae) vel, in *Oreochloa*, mutica aut brevissima aristata. Caryopsis libera, teres vel compressiuscula exsulca.

Gramina perennia montana et alpina praecipue in locis rupestribus calcareisque, raro in umbrosis et pratensibus.

OREOCHLOA Lk.

(Lk. hort. berol. I. 41. Sesleriae sect. II. Koch l. c. p. 912.)

Panicula subracemosa spiciformis, simpliciter ramosa ramis subunilateralibus, a basi decrescentibus, rachis flexuosa edentata. Spiculae subpyramidatae, ovato-oblongae, 2—3-florae, flosculo supremo tabescente. Flores pedicello apice calloso insidentes; rachis latere exteriori pilosa. Glumae valvis subaequalibus, ventricosis, convexis, muticis, acutiusculis, infra apicem leviter carinatis, flosculis dimidio brevioribus, complicatis ambitu oblongis, supra medium attenuatis, membranacéis, inconspicue trinerviis. Glumellae palea inferior dorso convexa, inconspicue quinque-

nervia, complicata oblonga, apice breviter bifida, vix emarginata mucronula interjecta instructa, dorso infra medium ciliata, supra basin pilosa, palea superiore multo minore inclusa, bicarinata apiceque breviter acute bifida, ambitu oblongo-lineararia, carinis ciliata. — Lodiculae membranaceae, oblongae, ovario quadruplo breviores. Ovarium oblongum, glabrum. Stylus brevissimus nudus. Stigmata longissima, plumosa, ex apice floris emergentia. — Caryopsis oblonga, leviter compressa, exsulca.

1. **OREOCHLOA DISTICHA** Lk. (l. c.);

Rhizomate fibroso, plerumque caespitoso; culmo 3—9 poll. alto, erecto, glabro, striato, inferne tantum foliato; foliis culmeis linearibus, brevibus, novellis longioribus filiformibus, canaliculatis vel convolutis, culmo plerumque brevioribus, omnia glabra obtusa; ligula folii supremi exserta, integerrima $\frac{3}{4}$ lin. fere longa, sensim acuminata; vagina folii supremi parum inflata, laxa; vaginis marcescentibus demum in fila solutis; panicula racemosa, spiciformis, 4—6 lin. longa, 2—4 lin. lata. Spiculis distichis, nitidis, sordide coeruleis, paleis margine albo-hyalino instructis. — Gramen perenne gracillimum. — *Sesleria disticha* Pers. Syn. I. 72. Steudel Synops. p. 296. *Cynosurus distichus* Hoffm. D. fl. 2. p. 49.

875. **SESLERIA** And.; Schur Verh. d. Zool. Vereins zu Wien.
(Walp. Ann. III. 771.)

Panicula contracta capitata vel elongata. Spiculae compressiusculae apice dilatatae, clavatae, 2—3-florae. Glumae valvis persistentibus, carinatis, acuminatis vel aristatis, magnis, flores fere tegentibus. Glumellae palea inferior obtusa, 3—5 lobato-dentata, dentes mucronatae vel aristatae. Axis spicularum glabra. Stigmata longissima, pilosa, ex apice floris emergentia. Ovarium piloso-hirtum. Caryopsis turbinata, teres, apice pilosa, libera, stylo coronata, exsulca, subpedicellata.

Hilum instar maculae fuscae laterali.

1. **SESLERIA COERULEA** And. (l. c.):

Glumae valvis inaequalibus membranaceis, valva inferiore minore, complicata ambitu lanceolata superiore oblonga, utraque a medio attenuata et aristata, arista valvis dimidio brevior. Glumellae palea inferiore complicata ambitu ovato-oblonga, apice rotundato breviterque trilobata, lobis in setas aristasque exeuntibus, arista crassa paleam dimidiam subaequante; palea superiore obtuse bifido. Ovarium apice pilosum. Foliis omnibus apice rotundatis mucronatisque; rhizomate repente vel fibroso. Descrip. l. c. vide.

Variat a) coerulescens v. straminea, b) gluma coerulea v. hyalina c) paleae glabrae v. strigosae-pilosae, d) panicula capitata v. elongata, e) ramuli paniculae secundi v. rachin undique tegentes, f) rhizoma fibrosum v. longe repens, g) folia lata v. angusta, magis minusve elongata apice rotundato-obtusa v. mucronata, rarissime sensim acuminata, h) culmus elatus debilis v. humilis et rigidus basi tantum v. supra medium foliatus, i) floret vere et autumnis, Maio et Septembri, k) crescit sociatim v. solitatem in locis lapidosis inque pratis uliginosis.

Varietates transsilvanicae memorabiles haec:

Sesleria coerulea autumnalis v. *serotina* Schur l. c. Rhizomate valde repente, articulato, culmos 3—4 florentes proferenti; culmos 9—3 poll. rigido, supra medium foliato, foliis culmeis infimis 6—12 poll. longis, 3 lin. latis, linearibus apice rotundatis; foliis culmeis superioribus oblongis, mucronatis, 4 lin. long. $1\frac{1}{2}$ —2 lin. latis plerumque complicatis et recurvis; ligula folii supremi brevissima, panicula spiciformi elongata 6—9 lin. longa 4 lin. lata laxiflora, flosculis coeruleis.

m) Varietas elongata aestivalis rhizomate fibroso v. breviter repente; culmo ad medium foliato 12 poll. alto; panícula elongata cylindrica 12—14 lin. longa; glumae valvis flosculis aequantibus, acutioribus et vix aristatis, albis; paleis glabris, spiculis variegatis; nempe valvis albidis paleis coeruleis = *S. c. elongata* mihi.

2. *SESLERIA RIGIDA* Heuff. (Rgsb. Flora 1833. p. 366.) Schur l. c.:

Glumae valvis subaequalibus, hyalinis, complicatis, ambitu oblongo-lanceolatis e medio attenuatis, acuminatis, flosculos subaequantibus. Glumellae palea inferiore semper strigoso pubescente, complicata ambitu oblonga, obtusissima, inaequaliter quinqueloba v. dentato-lobata, dentibus in 2—4 setas aristaeque exeuntibus, arista ciliata paleam suam dimidio aequante; palea superiore acute bifida. — Ovarium apice pilosum. — Folia culmea elongata rotundato et subito acuminata; folia novella culmo multo breviora; vel plana et flaccida, vel complicata et rigidiora. Ligula folii supremi exsecta inciso ciliata. Rhizomate fibroso vel repente. Inflorescentia laxiusculo-capitata v. ovoidea, axis undique flosculis tecta, spiculis sordide coeruleis culmo rigido supra basin crenatam recto. — (Staud. Synops. p. 296.)

Descript. l. c. vide.

Variat:

a) *capitata*: panícula subcapitata laxiflora $\frac{1}{2}$ pollic. longa demum basi attenuata; foliis novellis angustis $\frac{3}{4}$ lin. latis complicatis vel canaliculatis; culmo 8—10 poll. alto, ad medium foliato. = *S. capitata* Schur olim.

b) *ovoidea*: panícula ovoidea densiflora post anthesin basi attenuata clavata $\frac{3}{4}$ poll. longa spiculis subtrifloris; foliis novellis flaccidis culmo multo brevioribus, plerumque complanatis, latioribus 1—1 $\frac{1}{2}$ lin. latis; culmi 12—13 poll. alto. — *S. Dietzii* Schur Verhandl. und Mittheil. des Siebenbürg. Vereins für Naturwiss. zu Hermannstadt 1850. p. 109 n. 187.

c) *rigidifolia*: panícula ovata densiflora 8—9 lin. longa, basi obtusa; foliis omnibus complicatis, rigidis, culmum excedentibus et aequilatis; culmo rigido 15—18 poll. alto. = *S. rigida* Heuff. vera.

d) *longiseta*: panícula multiflora sub anthesi basi dilatata et recte truncata; valvis paleisque longius aristatis, arista valvam et paleam suam aequante; foliis fasciculorum novellium planis flaccidis vel complicatis, culmum aequantibus v. longioribus; culmo curvato, sub panícula flexuoso, supra medium foliato; spiculis 2 lin. longis 1 $\frac{1}{2}$ lin. latis, clavatis, supremorum valvis flosculos superantibus. — *S. permixta* Schur in litt. *S. coerulea* Friv. in herb. imp. An *S. coeruleans* Friv. secund. descript. Staud. Syn. p. 296.

3. *SESLERIA HEUFLERIANA* Schur l. c. (Sertum fl. Transilv. 1853. p. 84. n. 3101):

Glumae valvis subaequalibus hyalinis, complicatis ambitu oblongis, a medio attenuatis et aristatis, arista valvam dimidiam subaequante. Glumellae palea inferiore complicata oblonga, apice rotundato-acuminata, trilobato-dentata, dentib. in 2 setas aristaeque exeuntibus, arista valida paleam suam subaequante; palea superiore acute bifida; ovarium pubescens; folia culmea suprema a basi sensim attenuata infima complicata, omnia acuta; folia novella longissima flaccida, culmum plerumque superantia sensim attenuata, acuta, canaliculata v. plana, pagina superiore glauco-pruinosa, nervosa, nervis tribus crassioribus, margine serrulata; rhizomate fibroso et repente; panícula ovoidea, axis undique flosculis tecta; spiculis numerosis sordide coeruleis culmo rigidiusculo, supra basin curvatam recto.

Descript. l. c. vide.

Variat:

a) *polydactyla*: inflorescentia dense capitato-lobata, $\frac{3}{4}$ poll. longa et lata; culmo compresso subaphyllo, 12 pollic. vel humili curvatoque et 6 pollic. alto, foliis multo brevioribus.

b) *digitata*: inflorescentia tridigitata, lobo medio 12 lin. longo, binis lateralibus duplo brevioribus culmo 15 poll. alto, foliis plerumque brevioribus.

c) *elongata*: inflorescentia spiciformi elongata, laxiuscula, 1—2 poll. longa 3 lin. lata; rhizomate valde repente. — Aff. *S. robustae* Schott analecta bot. 1859?

4. SESLERIA TRANSILVANICA Schur l. c.

Glumae valvis subaequalibus coeruleis, valve inferiore angustiore, complicata ambitu lanceolata, valva superiore oblonga, utraque longissime attenuata et aristata valvam dimidio aequante. Glumellae palea inferiore complicata ambitu oblonga, obtuse acuminata, interdum quinquelobato-dentata, quinquenervia, nervis dentibusque in 2—4 setas aristamque exeuntibus; arista paleam suam subaequante rarissime parum longiore; palea superiore complicata ambitu oblongo-lanceolata, sensim attenuata, acute bifida, laciniis paleam dimidio aequantibus. Caryopsis subtomentosa apiceque pilosa. Folia culmea elongata infima culmo dimidio breviora; folia novella longissima culmum interdum superantia, omnia sensim attenuata, acutissima, nervosa, margine crasso albo-cartilagineo serrulata. Ligula subnulla. Rhizomate vix repente, brevissimo, lignoso. Inflorescentia densiflora amoene coerulea ovoidea. Culmo supra basin curvatum erecto.

In montibus calcareis herbaceis Transilvaniae occidentalis, prope Coronam ibidem in monte Hangenstein lecta, elev. 2500 ped.

Descript. l. c. vide.

5. SESLERIA HAYNALDIANA Schur Verh. u. Mittheil. 1850, p. 176.

Glumae valvis subaequalibus interdum hyalinis, flosculis dimidio brevioribus, complicatis ambitu ovatis, infra apicem recurvis, subito attenuatis et mucronatis. Glumellae palea inferiore complicata ambitu oblongo-ovata, obtusiuscula, apice 3—5 acuto lobato-dentata, evidenter quinquenervia, dentibus in 2 setas aristamque exeuntibus, arista palea sua quadruplo breviora; palea superiore complicata ambitu oblonga, apice acute bifida. Ovarium turbinatum, strigoso-pubescentis. Stylus ovarium duplo superans. Caryopsis matura subglabra. Folia culmea brevissima plerumque complicata; folia novella longissima angustissima, setaceo-convoluta v. complicata, omnia folia glabra obtusa viridia pagina superiore subglauco-pruinosa. Panicula plerumque depauperata unilateraliter spiculifera, viridis v. pallide coerulea. Rhizomate fibroso v. breviter repente. — *S. tenuifolia* Schr. non Schrad. *S. filifolia* Gris. non Heulf. *S. gracilis* Sert. fl. Trans. 3096. *S. tenella* Schr. non Host. ibidem 3095.

Hab. in montibus subalpinis Transilvaniae, in rupibus calcareis 2500—7000 pedes alta, Martio usque ad Augustam florens.

Descript. l. c. vide.

Variat:

a) *praecox pumilo-montana*: rhizomate fibroso; culmo humili 3—6 poll. alto, foliis omnibus angustissimis culmo brevioribus, complicatis, mollibus; panicula laxa subsecunda vel undique spiculis tecta, 3—4 lin. longa, flosculis pallide viridibus vel sordide coeruleis, glabris. — In alpinis calcareis, Kapellenberg prope Kronstadt. — Mart. Apr. 2500 ped. alt.

b) *aestivalis depauperata alpina*: rhizomate subrepente; culmo humili 3—4 poll. alto, gracillimo, supra medium foliato; foliis mollibus culmo florenti brevioribus, culmeis 3—5 inaequalibus; panicula simplex, depauperata e spiculis 5—8 composita; flosculis pallide coeruleis tenuissime strigosis. — *S. tenella* Schr. non Host. — In alpinis calcareis e. g. Kerzechoriensibus ibidem in monte Butian, 6000 ped. alt. Jun. Jul.

c) *rigidior*: foliis rigidis, complicatis, curvatis latiusculis, 1½ lin. latis culmum superantibus, panicula lucida variegata, nempe flosculis fusco-marginatis, glabris. — In monte calcareo Salomofelsen prope Coronam Majo 1844.

d) *interrupta*: panicula basi interrupta, ramulis distantibus, flosculis longius aristatis, arista paleam suam dimidio aequante, foliis rigidis glaucis incurvatis. — In loco eodem ac prior. Mai.

e) *gracilis*: culmo elato 12 poll., recto, basi foliato; foliis culmo vix brevioribus, complicato-setaceis, striatis, vaginis marcescentibus denique in fila irregulariter solutis; panicula 10—12 spiculata, flosculis stramineo-albis, glabris, panicula 4 lin. longa erecta. — *S. gracilis* Schr. Sert. flor. Transs. 3096. — In subalpinis Transsilvaniae e. g. in monte Ūcsim Teteje, in alpinis Kerzechoriensibus ibidem in monte Bulla, Juli 1848.

AMMOCHLOA Boiss.

(Boiss. diagn. XIII. p. 51.)

Spiculæ 11—13 floræ compressæ dense distichæ plures ad culmorum apicem in capitula basi glumis involucreta congestæ. Glumæ binæ flosculis breviores ovato-oblongæ subinaequales acutæ valde inaequaliter carinato-plicatæ, carina late alatae uninerves marginibus et carina membranaceæ ad medium subcoriaceæ, flosculi a basi turgida attenuati acuti oblongi vel lanceolati. Palea inferior ovato-oblonga coriacea quinque nervis concavo-plicata dorso teres inter nervos sulculosa apice in cuspidem subpungentem attenuata margine membrana hyalina sub cuspide superne abrupte desinenti marginata, palea superior hyalina paulo brevior multoque angustior lineari-lanceolata binervis ad nervos carinato-subplicata ciliatula apice truncata. Ovarium ovatum glabrum. Styli 2 apicales in stigmata elongata denticulato-pilosa sub apice flosculi egredientia attenuati. Antheræ lineares basi bifidæ.

Gramina annua facie Echinariam vel Oreochloam referentia, arenicola. Hoc genus forma glumarum valde inaequaliter plicatarum et quarum carina late alata pro margine ipso angusto subtus occultato absque inspectione accuratori haberi posset Sesleriaceis adnumerandum est. Sesleria ab eo præterea differt inflorescentia et habitu diversissimis, spiculis non distichis, flosculis non acutis, palea inferiori non coriacea nec truncato-pluridentata. *Oreochloa* Link spiculis distichis quoque donata flosculis carinato-compressis habitu glumisque diversissimis differt. Dactylis tandem cui priorem speciem botanici plures adnumeraverant caeteris neglectis stigmatibus e basi flosculi egredientibus longissime distat.

1. AMMOCHLOA PUNGENS Boiss. Diagn. XIII. p. 51.

A. glabra, foliis inferioribus anguste linearibus flexuosis, culmeorum limbo dilatato abbreviato obtusiusculo, ligula brevi truncata, culmis nudis folia sæpe pluries superantibus tenuibus, palea inferiori inferne hirtula apice in mucronem subrecurvum longiusculum abeunti marginibus sub mucrone in membranam rotundatam sæpe fimbriolatam manifestam abeuntibus.

Dactylis pungens Schreb. Gram. 2 tab., 27 fig. In Desf. atl. tab. 16. — *Sesleria echinata* Lam. III. tab. 47. fig. 2 (mala!).

Hab. in Barbaria (Desf. Bové! Durieu!).

2. AMMOCHLOA PALAESTINA Boiss. — Diagn. I. c.

A. glabra, foliorum omnium limbo elongato flexuoso anguste lineari apice attenuato ligula brevissima, culmis brevissimis incrassatis inanibus foliis multo superatis, palea inferiori sub lente scabridula in cuspidem brevissimum rectum attenuata marginibus sub apice obsolete membranacea.

Hab. in desertis Palaestinae australis circa Gaza ubi Aprili ineunte unicum specimen legi.

Habitus quodammodo Scirpi Micheliani. A praecedenti optime distincta scapis sesquipollicaribus subincrassatis intus vacuis, flosculis apice magis attenuatis in mucronem brevissimum a flosculo non distinctum nec recurvum lineam et amplius longum abeuntibus.

- 2a. AMMOCHLOA SUBACAULIS Balansa (in pl. Alg. excicc.) sub Sesteria. Explorat. scient. de l'Alg. II. p. 92.

Dense caespitosa, culmis 1—2" l. foliosis, foliis culmo longioribus planis, palea inferiore in cuspidem brevissimum rectum attenuata. — Coss. Bull. Soc. bot. Fr. I. 317. — *A. palaestina* Boiss. diagn. pl. or. l. c. (Dactylis p. Steud. Synops. p. 428). — *Poa cyperoides* Pourr. ined.) ex Willk. et Lge. Prodr. fl. hisp. I. p. 42.

(Walp. Ann. III. 771.)

1. POA ATTICA Boiss. et Heldr. in pl. Graec. exs. 1846. — Boiss. diagn. XIII. p. 57.

P. perennis glabra radice repenti, culmis basi compressis geniculatis dein erectis teretibus laevibus, foliis planis lineari-lanceolatis laevibus, vaginis omnibus glabris supremis limbo longioribus, ligulis omnibus truncatis brevissimis marginiformibus, panicula erecta oblonga ramis erectis strictiusculis scabris inferioribus ternis valde inaequalibus, spiculis 4—5 floris ovatis virentibus rubello variegatis, flosculis basi et ad carinam inferne lana parca protrahenda obsitis caeterum ad margines et 5 nervos prominulos glaberrimis lente punctulatis acutis anguste superne albo-marginatis.

Hab. in oliveto Athenarum ubi cl. Heldr. legit fine Aprilis.

Culmus circa bipedalis, folia inferne circa 2 lineas lata, panicula fere 3 pollices longa. Habitu et spicularum magnitudine affinis P. pratensi quae differt ligula longiori, culmis basi non compressis, paniculae ramis pluribus magis patulis, flosculis obtusiusculis ad dorsum et marginem dense pubescentibus. Accedens prope ad Poam compressam quae culmo rigido tota longitudine compresso, foliis abbreviatis, paniculae ramis brevissimis, flosculis obtusis obsolete nervosis ad margines puberulis longius differt.

1. POA PSYCHROPIHLA Boiss. et Heldr. in pl. Anat. exs. 1846. — Boiss. diagn. XIII. p. 57.

P. perennis glabra pallide virens, radice stolones numerosos saepe elongatos edenti, foliis inferioribus rigidulis erecto-patulis siccitate margine subconvolutis lanceolatis acuminatis caulinarum superiorum vagina limbo multo longiori, ligula brevissima rotundata, panicula valde contracta oblongo-lineari pedunculis scabridis strictis inferioribus geminis, spiculis virenti-rubellis subtrifloris ovatis, glumis lanceolatis acutis superiori carina scabrida, flosculis obsolete nervosis dorso margineque dense pubescentibus basi parce lana brevi connexis.

Hab. inter lapides deciduos regionis superioris montis Stavros Pisidiae et Anemas Lycaoniae alt. 6—8000', in regione alpina Olympi Bithyni (Boiss.).

Species P. cenisiae valde et forsitan nimis affinis ab eo tamen differre videtur glaucescentia, foliis angustioribus, ligula abbreviata, inprimis panicula valde contracta nec patente angusta, spiculis minoribus, flosculis lana pauciori connexis. An varietas orientalis P. cenisiae?

2. POA ALPINA L. — Steud. Synops. p. 250.

Var. *involverata* Lge. pugill. I. p. 47. Ligulis foliorum omnium etiam superiorum, brevibus truncatis, panicula folio ipsa panicula parum brevior involverata. (Forsan modificatio accidentalis etsi specimina numerosa adfuerunt). — Willk. et Lge. Prodr. fl. hisp. p. 81.

Hab. in regione alpina Pyreneor. Hisp. ad Port de Benasque.

3. POA LIGULATA Boiss. (Voy. II. 659. t. 178a.):

Dense caespitosa, culmis 2—6" l. gracilibus subaphyllis, foliis abbreviatis linearibus longe acutatis planis, ligula longissima lata irregulariter profunde fissa paniculae $\frac{1}{2}$ " densae ramis brevibus geminis; spiculis 5—6-floris 2" l. ovatis variegatis, glumis trinerviis. — Willk. et Lge. Prodr. fl. hisp. I. p. 81.

Hab. in glareosis regionis subalpinae et nivalis regni Granat. Hispaniae ad 5000—9800'.

4. POA ANNUA L. — Steud. Synops p. 250.

β . *uliginosa* Sándor (sec. Heuff. Verh. d. zool.-bot. Gesellsch. zu Wien 1858 p. 230): Panicula subsecunda coarctata; culmis adscendentibus geniculatis; foliis linearibus subito in apicem attenuatis.

Hab. in uliginosis et ad stagnorum margines Banatus Temesiensis.

5. POA STRICTA Lindeberg: Bot. Notis. 1855. p. 10.

Caespitosa. Radix fibrosa, stolonifera. Culmi rigidi erecti 2—3-nodosi, internodiis obtectis, 4—8 pollices alti, basi subcompressi, apice teretis glabri, obscure purpurei. Vaginae etiam obscure purpureae, compressae internodia obtegentes, summa excepta. Ligula $\frac{1}{2}$ —1 lin. longa, obtusa, lacera vel integra. Folia stolonum plana, linearia, acuta, 1—2 poll. longa, usque ad 2 lin. lata, supra et marg. scabra, demum convoluta. Panicula 1—2 pollicaris, subcontracta erecta vel subnutans; rachis subflexuosa ramis solitariis geminis v. ternis laeves, 1—3 spiculas gerentes. Spiculae flosculis viviparis fere $\frac{1}{2}$ poll. longae. Glumae naviculares acutae, superior paullo longior. Flosculi lana parca connexi, fl. inferioris palea infer. carina et nervis lateralibus albo-pilosa; fl. secundi et tertii paleae elongatae solidae, marg. hyalinae dorso nervosae apice in folium 4—6 lin. longum mutatae. — *Poa laxa vivipara* Ands. Gram. p. 45. *Poa cenisia stricta* Hn. Fr. II. N. XV. 94.

Hab. in locis aqua nivali irrigatis alpium Sueciae (Cluskutan) et Norvegiae (Dovre, Kluken etc.) Etiam in ins. Spitsbergen.

6. POA NARATAVICA Bunge (Rel. Lehmann in Mém. prés. à l'Acad. de St.-Pétersbourg VII. 1854. p. 525):

Radice stolonifera, culmo tereti laevissimo, foliis vaginisque glaberrimis, ligula elongata, truncata denticulata, paniculae contractae ramis subgeminis adpressis glaberrimis, spiculis oblongis subtrifloris flore summo saepe tabescente, glumis hyalinis inaequalibus inferiore uni-supiore trinervia glaberrimis, pilis contortuplicatis nullis, paleis subcoriaceis inferiore convexa prominulo quinquenervia extus aequaliter hispido-scabra superiorem vix superanti; lodiculis profunde bifidis.

Hab. in alp. Koratau 12. Sept. 1841.

Ab omnibus Pois genuinis differt palearum consistentio fere coriacea, glumisque hyalinis membranaceis. Hac ultima nota, ut etiam habitu quodammodo accedit ad *P. albidam* Turcz. praeter alia paleis membranaceis diversissimam. An forsitan aptius Moliniis adnumeranda?

Descript. locupletiolem l. c. vide.

7. POA REUTERIANA Boiss. et Buhse (in N. Mém. de la Soc. des Natur. de Moscou, vol. XII. p. 227).

Perennis caespitosa radice fibrosa culmis basi incrassato-bulbosis, foliis omnibus confornibus anguste linearibus laevibus flaccidis radicalibus confertis culmeis erectis, panicula lanceolata contracta pallida ramis brevibus erectis, spiculis compressis laxiuscule distichis ovatis 9—13-floris rachide breviter villosa, glumis subaequalibus oblongis acutis margine membranaceis dorso trinerviis scabridis, flosculis lanceolatis obtusis, glumella exteriori carinata obsolete 5-nervi, interiori bicarinata ad carinam ciliatula.

Hab. in montibus Jesder prope Máswor, Persia boreali.

Culmi sesquipedales, panicula tripollicaris, flosculi vix 2 lineas longi. Affinis Poae bulbosae, differt foliis elongatis.

8. POA CONFERTA Blytt (Norges Flora I. p. 123):

Viridis. Radix fibrosa. Culmi simplices, 1—1½ pedales, teretes glabri, tenuiter striati. Vaginae inferiores emarcescentes; superiores teretes, striatae, summae 2 internodiis breviores, quare hoc internodium culmum foliiferum inferiorem longitudine aequans. Ligula lineam elongata, obtusa, lacera. Folia ½—1 lin. lata, 1—2 poll. longa, ut plurimum convoluta rigida erecta supra et marg. scabra. Panicula erecta, rigida, 1—2 poll. longa, sub anthesi aperta, oblongo-ovata; rachis angularis, laevis; rami capillares flexuosi, scabri, saepius gemini, simplices et spiculam singulam gerentes v. supra medium 2—3-fidi, 2—3 spiculis terminati. Spiculae ovatae, compressae 2 lin. longae, 3-florae, sub anthesi apertae flosculis dissitis. Glumae inaequales, lanceolatae, carinatae, acutae, dorso rubro-violaceae, 3—5 nerviae, carina scabra. Paleae pallidae flavescentes, inferior obtusiuscula, 5-nervia, carina et nervis intermarginalibus strigosis; inferior angustior, ? *purpurea*: culmo, vaginis et panicula purpurea.

Hab. in alpe Dovre Norvegiae. — Poae Balfourei affinis.

9. POA (DIOICAPOA) TRISTIGMATICA Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 419.

P. caespitosa, culmo fertili pedali, laevi, sterilibus basi vaginis laxiusculis, albidis nitidis tectis; foliis 1—3-pollicaribus, compresso-plicatis, coriaceis, acinaciformibus, pungentibus, extus laevibus; ligula elongata, hyalina; panicula 3-pollicari, contracto-lobata, flavido-rubescens; spiculis (femineis) 3—4-floris, ovatis, 3½—4 lineas longis; glumis ovato-lanceolatis, 3-nerviis, carinatis; pilis lanuginosis apice implexis, flores erectos aequantibus; flore inferiore 3 lin. longo; palea inferiore oblongo-acutiuscula, 5-nervia, nervis 3 basi ciliolatis, basi rubescens, apice flavido; superiore ½ minore; staminibus 3; antheris effoetis; ovario 3-gibboso; stigmatibus 3, uno antico, minore, 2 posticis; spiculis (masculis) similibus sed minus lanuginosis.

Hab. in Cordillera de Talcaregue, Chile (Gay); Buha Duclos; freti Magellanici (Commerston).

10. POA (DIOICAPOA) GAYANA Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 416.

P. caespitosa, lutescens; culmis fertilibus 12—14-pollicaribus, erectis, apice scabris; foliis subcoriaceis, plicatis vel rarius subplanis, apice cartilagineis, scabris; ligula hyalina, oblonga; vaginis scabris; culmis sterilibus fertilibus ½ brevioribus, vix tunicatis panicula 4—5-pollicari, contracta, interrupta, obscura; ramis laxiusculis, 1—2 poll. longis; spiculis (masculis) 4—5-floris, 3—3½ lin. longis, ambitu subquadratis; floribus valde patulis; racheos articulis glabris; glumis inaequalibus, acutis, dorso sublaevibus; palea inferiore 2¼ lin. longa, ovato-lanceolata, acuta, 5-nervia, laevi, glabra; superiore ¼ minore, carinis pubescentibus; antheris 3 linearibus.

Hab. in Cordillera de Chili (Gay).

11. POA CHILENSIS Trin. in Linnaea X. p. 306 (1835). Steudel Synops. p. 258 u. 123.

β. (*mascula*) Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 415. Rachi lanuginosa; palea inferiore dorso et ad margines sericeo-ciliata.

Hab. in Andibus Chilensibus; Cordillera de los patos (Gay).

12. POA ACINACIPHYLLA Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 412.

P. pulchra, tota flavescens et glabra, 2—2½-pedalis, robusta, culmos fertiles sterilesque agens; foliis 2—4-pollicaribus, plicatis, acinaciformibus, ad apicem obtusum cartilagineo-mucronatis; ligula scariosa, producta; panicula nutante, depauperata, 8-pollicari; ramis geminis, 2—6 spiculas gerentibus; spiculis ovatis, 1—3-floris, adjecto pedicello sterili floris alterius 2—3½ lin. longis; glumis ovato-obtusiusculis, inferiore minore, superiore 3-nervia florem basi non lanuginosum, 2 lin. longum aequante; paleis subaequalibus, in feriove ovato-elongata, carinato-subtrigona, obtusissima, 5-nervia, glabra; coryopsi 1 lin. longa; compresso-trigona, lutescente.

Hab. in Chile (Gay n. 1119 Cat. propr.)

13. POA CHORIZANTHA Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 407.

P. rhizomate fibrillis tenuibus obtecto, repente; culmis fertilibus subpedalibus, erectis ultra medium foliatis, foliis planis, laevibus, 1—2-pollicaribus, lineam latis, apice cartilagineo-mucronatis; ligula ovata integra, hyalina; panicula oblonga, laxa, 3—4-pollicari; ramis geminis, 1/2 paniculae attingentibus, spiculis 1—4, primum lanceolatas, deinde floribus paucis ovatas, 4—5-floras. 3 1/2—4 1/2 lin. longas gerentibus; glumis obtusissimis, utraque 3-nervia; floribus distantibus, plus minus late ellipticis, sub 2-linealibus; rachi glabra; palea inferiore obtusissima, saepe submarginata, basi viridula, apice straminea, 5-nervia, nervis 3 inferne ciliatis; antheris linearibus.

Hab. in Chile (Gay).

14. POA VALDIVIANA Ph. Linn. XXIX. 97.

P. perennis, dioica; culmis gracilibus, filiformibus 1—1 1/2-pedalibus, strictis, 2—3-nodibus; internodio ultimo longissimo, ante paniculam scabriusculo; foliis anguste linearibus, convolutis, strictis; ligula brevissima, truncata; panicula angusta, contracta, sublobata, 2 1/2—3-pollicari, ramis erectis, ad summum 6 lin. longis, scabris; spiculis foemineis 2—2 1/2 lin. longis, lanceolatis, quadrifloris, omnino scabris; flosculis appressis; glumis ovato-lanceolatis, inferiore uninervia, superiore trinervia; paleis subaequalibus, oblique truncatis, trinerviis, ante apicem scariosum violaceis; palea superiore ovata, margine dense ciliata, vix 1/5 brevior.

In prov. Valdivia, loco los Pantanos dicto praedii mei S. Juan inveni.

15. POA LATIFOLIA Ph. l. c.

P. perennis, dioica; culmis tripedalibus; foliis radicalibus ultra pedem longis, 6 lin. latis, margine et nervo mediano scabris, sensim in apicem peracutum desinentibus; ligula brevi, truncata, lacera; panicula 10 poll. longa, satis densa; ramis quaternis, multifloris; spiculis 4 lin. longis, quadrifloris; glumis subaequalibus, spiculam subaequantibus acutis, margine scariosis; inferiore uninervia angustiore, acuta; superiore trinervia, obovato-oblonga; floribus foemineis basi pilosis; palea inferiore glumae superiori omnino aequali, sed distincte 5-nervi, in nervo mediano scaberula, caeterum glabra; superiore angusta acuta.

In monte Cerro de Chonos ad circa 1290 ped. s. m. legit et Dr. Fonk.

16. POA CHONOTICA Ph. l. c.

P. perennis, dioica; culmo 1 1/2—2-pedali, usque ad medium foliato; foliis complicatis, subfalcatis, excepto margine laevissimis; radicalibus strictis erectis, vagina alba, nitida, et lamina modo 5 poll. longa, 4 lin. lata compositis; caulinis sensim decrescentibus, lamina ultimi modo pollicem longa; ligula brevi, truncata, lacera; panicula erecta, oblonga, 5-pollicari; ramis ternis binisque; spiculis 3 1/2 lin. longis, 2—3-floris, fere ut in priore, sed paleae medio violaceae, basi latiores et apicem versus angustatae.

Cum priore lecta est, Folia et basis culmorum fere ut in *Poa robusta* Steud.

17. POA VIOLASCENS Ph. Linn. XXIX. p. 100.

P. perennis? caespitosa? foliis radicalibus. . . ; culmis erectis, gracilibus, superius nudis; foliis culmeis distantibus, brevibus, una cum vaginis glabris; ligulis elongatis; panicula contracta 1 1/4—1 1/2 poll. longa; ramis binis ternisque, brevibus, laevissimis; spiculis pedicello suo longioribus, 2 3/4 lin. longis, ovatis, 3—4-floris; glumis ovatis, acutis, violaceis, fere 1 1/2 lin. longis; palea inferiore glumam vix superante, ovata acuta, viridula, superius fulva, margine hyalina, trinervia, in carina et nervis lateralibus, margini approximatis longe et lanuginoso-ciliata, rachide glabra.

Prope Arauco invenit et Gay. Herb. Chil. no. 164. — Culmi 15, omnes parte radicali carentes, suppetunt; 9—11 poll. longi sunt, sed nodis duobus modo constant; ultimum internodium 5—6-pollicare; vaginae circa tertiam internodii partem occupant, folium antepenultimum 11 lin. longum, 1 1/2 lin. latum. — Differt a *P. holciformi*, qua-

*) Obs. *Poa latifolia* Forster est *Centotheca* Desv., *P. latifolia* Pohl vero *sudetlica* Haenke.

cum spiculis violaceis convenit, culmo superius nudo etc.; a *stenantha* culmo laevissimo, spiculis ovatis, a *chorizantha* spiculis trifloris, nec 4—5-floris, glumis, paleaque inferiore acutis.

18. POA TENERA Mueller (Mss. Ex Hook. fl. Fl. Tasm. vol. II, p. 124. tab. 164 A.):

Debilis, glaberrima v. scaberula, culmis ramosis tenuibus foliosis, foliis angustis planiusculis, ligula mediocri membranacea, panicula effusa, ramis capillaribus paucifloris, spiculis parvis pallidis 3—5-floris, floribus remotis, palea inferiore obtusa 5-nervi dorso marginibusque pubescente basi nuda v. parce barbata.

Hab. in silvis locisque obscuris Tasmaniae et Victoriae in Nov. Holl. vulgaris.

Gramen quam *P. australis* gracilior, ligula membranacea optime distincta. — Culmi 1—8-pedales, saepe flaccidi scandentes. — Non esse potest *P. laxicola* Br., ut creditur Nees.

P. saxicola Br. (prodr. 180). — Steud. Synops. p. 262. — Hook. fl. Fl. Tasm. v. II, p. 124. tab. 164 B.

Hab. in Tasmania: Mount Wellington (Gunn).

19. POA AUSTRALIS Br. (prodr. 179):

Rigida, scabra v. glaberula v. polita, culmis dense caespitosis foliis setaceo-involutis filiformibusve longioribus v. aequilongis, ligula brevissima, panicula effusa variis contracta, ramis paucifloris inferioribus capillaribus, glumis scabris 3—7 floris, floribus remotis approximatisve palea inferiore 5-nervi apice scariosa obtusa basi plus minusve lanata v. nuda. — Hook. fl. Fl. Tasm. II, p. 123. Steud. Synops. p. 262. — *P. laevis* R. Br. Prod. 179. Steud. l. c. — *P. plebeja* R. Br. et Steud. l. c.

Var. α . *Billardieri*: 1—2-pedalis, glaberrima, polita, culmis inferne ramosis foliis spithamaeis tereti-involutis longioribus aequilongisve, panicula lanceolata contracta spiculis confertis majusculis, glumis acutis floribusque 5 approximatis scabris basi parce lanatis. (Descript. ab exempl. Labillard.) — Arundo poaeformis Lab. Fl. Nov. Holl. I. 27. t. 35. Cfr. *P. Labillardieri* Steud. Synops. p. 262“ vix videtur *P. australis* varietas ramosa prolifera“.

Var. β . *monticola*: glaberrima v. scaberula, culmis brevibus densissime caespitosis, pedalis foliis setaceo-involutis longioribus, panicula ovata subcontracta v. effusa, spiculis majusculis 3—7-floris, glumis acutis floribusque remotis scaberulis, palea inferiore subtruncata purpurea marginibus albis (apice saepissime membranacea basi parce villosa v. nuda. — *P. laevis* Br. prodr. l. c. Steud. Synops. l. c. (Gunn 1466.)

Var. γ . *Sieberiana*: scabrida v. glaberrima, foliis setaceis filiformibus culmo aequilongis longioribusve, panicula ovata contracta v. effusa, ramis inferioribus capillaribus elongatis, spiculis parvis purpureis viridibusve 3—6-floris, glumis flosculisque remotis glabratiss v. scaberulis, palea inferiore oblonga v. lineari basi parce lanata rarius nuda. *P. Sieberiana* Kunth, fide Nees in Herb. Lindl. *P. effusa* Nees in Hook. Lond. Journ. Bot. II. 418. Steud. Synops. l. c. (Gunn. 596, 1010, 597).

Var. δ . *capillifolia*: scabrida v. glaberrima, foliis capillaceo-setaceis culmo brevioribus, panicula contracta v. rarius effusa, ramis inferioribus capillaceis elongatis, spiculis viridibus parvis 3—6-floris, glumis flosculisque remotis scaberulis, palea inferiore oblonga v. lineari basi nuda. (Gunn. 596, 1469, 1468, 1470).

Hab. in omni Tasmania, in Nova Hollandia extra tropicali et in Nova Zelandia. Var. α . in ripis marinis locis arenosis, Var. β . in cacumine montium ubi vulgo pascitur; Var. γ , δ . omnium vulgarissimae.

Huc etiam forsitan pertinet *Poa affinis* Br. = *P. australis* β . Nees l. c. Modificationes extremae sunt: (1) α . Gramen totum glabrum, lucidum, robustum, culmo 2-pedali, spiculis villosis confertis, (2) var. δ . gramen densissime caespitosum, saepe vix digitale, foliis setaceis, panicula capillari, spiculis parvis fere glabris, viridibus flosculis medio remotis. Inter quas formae intermediae numerosae, exacte ut in *Festuca ovina* europaea.

20. POA ANCEPS Forst. (Prodr. 43) Hook. fil. fl. n. New Zeal. p. 306. Steud. Synops. p. 263. *P. australis* A. Rich. Fl.; All. Cunn. Herb. et Prodr.

α. *elata*: 2—3-pedalis, foliis planis culmo longioribus coriaceis, panicula effusa vel contracta, spiculis majusculis 6-floris, flosculis remotis patulis, glumis subacutis.

β. *foliosa*: foliis distichis confertis angustioribus planiusculis vel carinatis culmo longioribus; panicula contracta elongata, ramis suberectis, spiculis minoribus 2—5-floris ovatis, flosculis approximatis, glumis latiusculis.

γ. *breviculmis*: culmis brevibus compressis, foliis distichis culmo brevioribus curvis coriaceis latiusculis acutis, panicula parva ovata ramis brevibus, spiculis brevibus ovatis 3—4-floris, flosculis confertis, glumis brevibus acutis, palea infer. lata.

Hab. in Nova Zelandia copiose.

21. POA AFFINIS Br. Prodr. 179. — Steudel Synops. p. 262. Hooker fil. Fl. New Zeal. p. 307. *P. caespitosa* Forst.? Prodr. RS. p. 536. Sprengel in Mém. Acad. Petrop. 1810 p. 302. Steud. Synops. p. 263.

α. *multiflora*: panicula effusa, glumis 4—6-floris flosculo brevioribus.

γ. *agrostidea*: saepius scaberula, panicula contracta, glumis 1—2-floris flosculo longioribus. — An *Agrostis rigida* A. Rich. Fl.?

Hab. in Nova Zelandia: Northern Island. Var. α. Hawky bay (Colenso); var. β. Akuriri (Colenso), Great Barrière Island (Sinclair).

22. POA LAEVIS Br. (Prodr. 179). — Steudel Synops. p. 262. Hook. fil. Fl. New Zeal. p. 307.

α. *brevifolia*: parvula, glaberrima, culmis foliis longiore, panicula elongata effusa.

β. *filifolia*: culmis foliis filiformibus aequilongis vel longioribus, panicula elongata, spiculis ramis inferioribus subspicatis.

Hab. in Nova Zelandia: Northern et Middle Islands: in campis Taupo, in montibus Ruahine etc. (Colenso), Otago (Lyll), in campis Aglionby (Monro). Var. β. Akaroa (Raoul); Taupo et Taraweru (Colenso).

876/1. **DISTICHLIS** Rafin.; Desv.

(Rafin. Prodr. Nov. Gen. in Journ. phys. LXXXIX. p. 104. — Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 395.)

Spiculae dioicae, compressae, multiflorae, floribus arcte imbricatis. Glumae flore contiguo paulo breviores, acutae. Paleae 2, subaequales, inferior carinato-convexa, coriacea, 7—9-nervia, ovata, acuta v. obtusiuscula, mutica; superior saepe longior, basi dilatata, truncata, carinis rectis, parallelis. Squamulae 2, carnosae, truncatae. Stamina 3, in foemineis effoeta. Ovarium glabrum, apice attenuatum. Styli terminales basi subconnati, longe nudi. Stigmata breviter plumosa. Caryopsis elliptica, apicata, a latere compressa, turgide biconvexa, postice exsulca, antice area embryonali $\frac{1}{2}$ ipsius attingente praedita, pericarpio crassissimo, superficie duro et rugoso, intus valde spongioso, albumen farinaceum sphaeroidale arcte cingente donata.

Hoc genus multis notis a gen. *Poa* est diversum; ad *Aeluropum* Trin. (*Brizopyrum* Lk.) appropinquatur, a quo tamen bene differt caryopside singulari. Etiam *Uniolae* affine. Praeter *Poam distichophyllum* Br., *P. scoparium* Kth. et *Brizopyrum boreale* Presl. huc refert Desvauz sequentes species chilenas:

1. *DISTICHLIS THALASSICA*. — Poa HBKth., Kth. Gram. I. 337. — Megastachya RS. Syst. II. 590. — Uniola Trin. Act. petr. 6. I. 359. Steud. Synops. p. 281. n. 8.
2. *DISTICHLIS MARITIMA* Raf. — Poa Michauxii Kth. Gram. I. 141. et II. 533. Agr. Syn. I. 325.
3. *DISTICHLIS PROSTRATA*. — Poa HBKth., Kth. Gram. II. 461. Steud. Synops. p. 281. n. 6. — *Agrostis pungens* Bertero mss. n. 785.

878. **GLYCERIA** R. Br.

(Walp. Ann. III. 873.)

1. *GLYCERIA Plicata* Fries. — Steud. Synops. p. 281.

β. *spicata* Lange (Pugill. I. p. 45). Differt a forma typica praecipue ramis brevioribus, palea superiore inferiorem superante et extra eandem exserta. — Willk. et Lge. Prodr. II. hisp. I. p. 78.

Hab. in Hispania ad Benavente in Castill. vet. ad ripas fl. Manzanares Madriti et pr. Guadarrama Lge. — Etiam in Corsica et Sicilia.

2. *GLYCERIA STRICTA* Hook. fl. (Fl. New Zeal. p. 304):

Glaberrima; culmis caespitosis strictis foliosis, foliis brevibus strictis involutis, panicula stricta erecta contracta, ramis pedicellisque brevibus strictis, glumis inaequalibus acutis, superiore 3-nervi, flosculis 6—14 confertis, palea inferiore glaberrima acuta coriacea, nervis inconspicuis, squamula oblonga. — Hook. fl. Fl. Tasm. vol. II. p. 123. tab. 162 B.

Hab. in Nova Zelandia, Middle Island: Akaroa (Raoul); in Tasmania in palude prope Launceston (Gunn.) et in Victoria Nov. Holl. — Floret Novemb.

Culmi $1\frac{1}{2}$ —2 pedales, validi; vaginae foliorum longae, subdilatae, lamina brevis 2—4 pollices longa; panicula 4—6 pollicaris, sat gracilis.

3. *GLYCERIA FLUITANS* var. *STRICTA* Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 390.

G. panicula 15-pollicari, stricte erecta, angusta, pallida, ramis inferne 5—6-verticillatis, a basi spiculas subsessiles gerentibus, erectis; spiculis linearibus, nonnumquam subarcuatis, 11—15-floris; glumis inaequalibus, ovato-oblongis, superiore florem contiguum aequante; floribus elliptico-elongatis, $1\frac{1}{4}$ —2 lin. longis; palea inferiore (explanata) ovato-elliptica, apice scarioso-obtusissima, valide 7-nervia, superiore subaequali, elliptica, utrinque attenuata, carinis anguste marginatis; antheris $\frac{2}{5}$ lin. longis.

Hab. ad Quillota regni Chil. (Bertero. n. 1240).

Proxima est *Gl. plicatae* Fr.

4. *GLYCERIA (CATABROSA) AQUATICA* Presl. Steud. Synops. p. 286.

β. *latifolia* Heuff. (Verhandl. d. zool.-bot. Gesellsch. zu Wien 1858 p. 231): valva inferiore minima oblonga, apice eroso-emarginata; panicula conferta multiflora, densata divaricata; foliis planis nervosis, margine serrulato-scabris, culmo plus duplo latoribus.

Hab. in Banatu Temesiensi.

881. **CATABROSA** Palis.

(Walp. Ann. I. 940.)

CATABROSA TENUIFOLIA Presl. in Rel. Haenck. I. 256. Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 392. tab. 81. f. 2. — *Glyceria* (?) *tenuifolia* Steud. Synops. p. 286. n. 31.

881/1. **ATROPIS** Rupr. Fl. Samoij. p. 64.

ATROPIS MAGELLANICA Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 394. — *Catabrosa magellanica* Hook. fil. Fl. Ant. I, p. 387.

A. pedalis, erecta, glaberrima, foliis involutis; ligula ovata, acuta; vaginis inferne laxis; panicula 5—7-pollicari, elongata; ramis elongatis, gracilibus; spiculis oblongis, 4—6-floris, 4—6-linealibus; floribus distantibus; subcylindraceis; paleis aequalibus, inferiore angusta, elongata, in apicem obtusum attenuata, $1\frac{3}{4}$ —2 lin. longa, praeter callum brevissime extus pilosum glaberrima.

Hab. ad fretum magellanicum, Puerto del Hambre (King).

882. **COELACHNE** R. Br.

(Knth. en. I. 370.)

COELACHNE INFIRMA Buse. — Buse in pl. Jungh. III, p. 350.

Paniculae angustae ramis subsolitariis remotis, spiculis virgineis lanceolatis; glumis dimidia spicula breviorib., fl. pedicellato pubescente, f. lanceolatis parvis, culmo b. decumbente debili.

Hab. ins. Javae in locis paludosis m. Diëng alt. 6200'. (Jungh.)

Culmi decumbentes, mox erectae etc.

883/1. **RHOMBOELYTRUM** Link. Hort. II. p. 296. Em. Desv.

Gram. Chil. in Gay fl. chil. t. VI. p. 386.

Spiculae 4—7-florae, biconvexae, subrhomboideae, utrinque attenuatae. Flores arcte disticho-imbricati. Rachis articulata. Glumae 2, aequales, carinato-concavae, 3—5-nerviae, muticae, spiculam dimidiam aequantes vel superantes. Paleae 2; inferior carinato-concava, apice emarginato-biloba, inter lobos obtusos mucronulata, ad basim callosam pilosa, oblique 3—7-nervia; superior aequilonga vel minor, carinis ciliatis ante apicem truncatum evanescentibus. Squamulae 2, integrae. Stamen 1. Ovarium glabrum. Styli 2, breves. Stigmata breviter plumosa. Caryopsis oblongo-obovata, compressa vel compresso-triangulari, hinc vix sulcata, hilo punctiformi.

1. **RHOMBOELYTRUM BERTEROANUM** Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 387. pl. 81. f. 1.

R. caespitosum, erectum, $1\frac{1}{2}$ -pedale et ultra; foliis angustis, scabrusculis; ligula brevi, truncata; panicula rigida, 1—3 $\frac{1}{2}$ -pollicari, subspiciformi-contracta, subinterrupta, pallide viridi; spiculis compressis elliptico-acutis v. rhomboideis, 4—6-floris, $2\frac{1}{4}$ — $2\frac{1}{2}$ lin. longis; floribus arcte imbricatis; glumis subaequalibus, elliptico-elongatis, obtusis trinerviis; rachi glabra; paleis subaequalibus, $1\frac{1}{3}$ — $1\frac{1}{2}$ lin. longis; inferiore elliptico-elongata, scabrida, oblique 3- sub 5-nervia, ad callum tantum breviter pilosa, obtuse emarginata, mucronulata; superiore lanceolato-attenuata, apice hyalino ultra carinas ciliatas producto; stamine 1; caryopsi convexo-subtrigona.

Hab. ad Quilloa (Bertero. n. 947).

2. **RHOMBOELYTRUM RHOMBOIDEUM** Link Hort. II. p. 296. — Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 386. tab. 81. f. 3.

R. erectum, culmo apice scabro; foliis scabris; ligula ovali; panicula angusta, contracta, 4-pollicari; ramis adpressis; spiculis late rhomboideo-ellipticis, biconvexis, obtusis, 3 lin. longis, 6—7-floris, clausis; floribus arctissime imbricatis; glumis aequalibus, spicula $\frac{1}{2}$ tantum brevioribus, carinato-navicularibus, 5-nerviis; rachi glabra; palea inferiore 2— $2\frac{1}{2}$ lin. longa, concava, late elliptica, apice inter lobos obtusos mu-

cronulata, 9-nervia, nervis lateralibus obliquis, ad margines utrinque ad medium usque incrassatos et ad callum pilosa, superficie puberula; palea superiore $1\frac{1}{2}$ -lineali, ovali; caryopside obovata, compressa.

Hab. ad Rancagua, Chili (Bertero n. 277).

884. CHASCOLYTRUM Desv.

(Knth. ea. I. p. 373. suppl. 308.)

1. CHASCOLYTRUM STRICTUM Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 384.

Calotheca stricta W. J. Hook. Bot. Beech. Voy. Chil. p. 50. Steud. Synops. p. 284 n. 23. — *Briza erecta* Trin. in Linnaea X. p. 307. non Lamk.! — *Chascolytrum subaristatum* Poepp. mss. in Herb. Monacensi non Desv.

2. CHASCOLYTRUM TRILOBUM Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 383.

887. MELICA L.

(Walp. Ann. III. 774.)

1. MELICA HUMILIS Boiss. voy. p. 662. t. 177.

Culmis humilibus, f. strictis rigidis, ligulis subnullis, panicula subsecunda, glumis ovato-lanceolatis, spiculis trifloris, flosculis superioribus sterilibus acuilongis in corpusculum pyriforme truncatum tuberosum accretum, flosculi inferioris glumella exteriori acuta tota superficie longe ciliata, interiori obtusa margine breviter pubescente.

In rupib. reg. alp. Sierra de Gador pars superior, ad margin. planitie superioris. Alt. circa 6000'. — Fl. Aug.

2. MELICA HUMILIS Boiss. (Voy. II. 662. t. 177):

Stricta, culmis $\frac{1}{2}$ l., foliis convoluto-setaceis strictis, ligula truncato-lacera utrinque longe decurrente, thyrsi cylindrici laxi non interrupti spiculis trifloris floribus sterilibus in corpusculum cylindricum pyriformi-truncatum tuberosum aceretis, palea inferiore tota superficie longe ciliata. — Willk. et Lge. Prodr. fl. hisp. I. p. 86.

Hab. in Hispania, in reg. alpina regni Granat. (Sierra de Gador ad 6000': Boiss.)

24. Aug.

3. MELICA MICRANTHA Boiss. et Hoh. in pl. Kotsch. Pers. bor. 1846. — Boiss. diagn. XIII. p. 53.

M. glaucescens culmis elatis laxe foliosis glabris, vaginis multistriatis retrorsum scabridulis, limbo anguste lineari subtus glabro laeviusculo superne sub lente adpresse tomentello, ligula oblonga acutiuscula, panicula spiciformi angusta laxa interrupta, pedicellis strictis brevissimis apice subscabridis, spiculis brevissimis pallidis, glumis membranaceis laeviusculis oblongis acutis superiori quarta parte longiori angustiorique flores superanti, palea inferiori flosculi hermaphroditi oblongo-lanceolata obtusiuscula margine pilis flavidis ejus diametro longioribus dense ciliata dorso scabridula interiori paulo breviori glabra, flosculis neutris binis corpusculum pedicellatum turbinatum truncatum flosculo fertili brevius formantibus.

Hab. in faucibus montis Elbrus prope Derbend Kotsch. n. 435.

Culmi 2—3-pedales, spica 2—3 pollices longa 4—5 lineas lata, spiculae 2 lin. tantum longae dimidio minores eis M. ciliatae quae nostrae magis affinis praeter florum magnitudinem paniculamque longiorem densiorem egregie differt glumis longe acuminatis, paleae pilis albis nec flavidis spiculam longe nec breviter superantibus, flosculorum neutrorum corpusculo oblongo acuto.

4. MELICA CRETICA Boiss. et Heldr. in pl. Cret. exs. 1847. — Boiss. diagn. XIII. p. 54.

M. caespitosa, culmis nanis parce foliosis glabris laevibus, foliis rigidulis brevibus convolutis filiformibus extus laevibus intus brevissime sub lente hirtellis, ligula truncata sublacera glabra, panícula spiciformi simplici oblonga laxiuscula, pedicellis strictis scabridulis spicula subbrevioribus, glumis membranaceis flavidis rubellisve ovato-oblongis acutis laeviusculis inferiori paulo breviori latiorique, palea inferiori flosculi hermaphroditi oblongo-lanceolata acuta margine pilis atbidis ejus diametro longioribus spiculam superantibus dense ciliata dorso scabrida, superiori breviori ad margines ciliatula, flosculis neutris linis corpusculum oblongum laeve pedicello aequilongo suffultum flosculo fertili brevius formantibus.

Hab. in saxosis cacuminis Hagios Theodoros montium Sphacioticorum alt. circ. 7000' rara (Heldreich), in regione superiori Libani supra Cedros (Boiss.).

Culmi cum floribus 3-4 pollices tantum longi, spicae simplices pollicem aut paulo amplius longae, spiculae lin. 2½ circ. longae. Species nana hoc characterē *M. hispanicæ* Boiss. Voy. Hisp. accedens quae ab ea foliis minus angustis convolutisque facie superiori glabris, spiculis majoribus, corpusculo neutro turbinato-pyriformi truncato distinguitur. Specimina Libanotica Creticis optime congruunt.

5. MELICA HOHENACKERI Boiss. — Boiss. diagn. XIII. p. 54

M. culmis ascendentibus elatis glabris foliosis, vaginis foliorum inferiorum pilis longis mollibus deflexis hispidis 1-2 superiorum glabris, limbo omnium rigido lineari siccitate convoluto glabro scabriusculo, ligula brevi fimbriato-lacera, panícula spiciformi composita laxa angusta interrupta, pedunculis pedicellisque strictis laeviusculis, glumis pallide rubellis lanceolatis acutis laeviusculis carina subscabridis flosculos superantibus superiori paulo breviori, palea inferiori flosculi hermaphroditi lanceolata acuta dorso undique pilis longis spiculam aequantibus hirsuta, interiori paulo breviori lineari apice rotundata margine scabridula, flosculo neutro unico longe pedicellato anguste oblongo-lineari laevissimo.

M. Persica Hohen. Talüsch. Enum. non Kunth. — *M. Persica* β. *Caspica* Griseb. gram. Ross.

Hab. in districtu Talüsch prov. transeaucaicarum (Hochstetter).

Planta 1½-2 pedalis, spica 4-5 pollicaris angusta, spiculis 3½ lin. longis. Haec est de qua in diagnosis *M. inaequiglumis* et *breviflorae* sermonem feci et quam ex auctoritate Botan. Rossicorum pro *M. Persica* habui quam nunc icone Kunthiana colata diversissimam comperi foliis omnibus cum limbo pubescenti-villosis, glumis valde inaequalibus, flosculis neutris pluribus imbricatis flosculum turbinato-truncatum scabridum formantibus. Ad hanc *M. Persicam* Kth. veram referenda est *M. Kotschyi* Hochst. in Pl. Kotsch. Kurdist. Nostra *M. Hohenackeri* prope *M. Cupani* Guss. collocanda est ab ea vaginis inferioribus eximie et deflexe hirsutis, flosculo neutro unico nec pluribus, aliisque notis distinctissima.

6. MELICA PANNOSA Boiss. — Boiss. diagn. XIII. p. 55.

M. caespitosa culmis pumilis basi geniculatis dein erectis foliosis adpresse velutinis, foliis omnibus ad vaginas et limbum densissime et brevissime tomentosis argyreo-sericeis, limbo patenti plano lanceolato attenuato-acuminato, ligula marginiformi brevissima, spicis oblongo-cylindricis terminalibus densis, spiculis subsessilibus, glumis membranaceis stramineo-rubellis acutis glabris inferiori ovato-oblonga triplo breviori superiori lanceolata, flosculi hermaphroditi palea inferiori pilis albis glutinam aequantibus undique dense hirsuta, superiori paulo breviori angustiori obtusa margine ciliatula, flosculis neutris binis pedicellatis imbricatis apice truncatis valde scabrido-aculeatis interiori multo breviori.

Hab. in rupibus calidis Antilibani ad Souk Wadi Barrada, legi Maio 1846.

Semipedalis vel paulo longior, foliorum limbus 2-3 pollicaris, spicae sesquipollicares, spiculae 3½ lin. longae. Affinis *M. Persicae* Kth. Gram. tab. 89 quae ex icone differt indumento multo minus denso et pannoso, spica laxa, spiculis longe pedicellatis,

flosculis neutris aequilongis. *M. Kotschyi* Hochst. quae probabiliter eadem ac *M. Persica* iisdem notis ligulae elongata distinguitur. *M. vestita* Boiss. denique spicis laxis, foliis angustioribus minus dense hirsutis, flosculo neutro cylindrico laevi differt.

7. MELICA ELIGULATA Boiss. l. c. p. 56.

M. caulibus ascendentibus elatis foliisque densissime et adpresse tomentellis subscabridis, limbo plano lanceolato erecto-patulo longe attenuato subulato, ligula prorsus nulla, panicula spiciformi cylindrica subcomposita densa pedunculis pedicellisque strictissimis hisce spicula multo brevioribus, glumis membranaceis pallide stramineis acutis inferiori ovata superiori triplo longiori lanceolata, palea inferiori flosculi hermaphroditi dorso undique pilis niveis glumam superantibus dense hirsuta, superiori breviori lineari obtusa margine retrorsum ciliatula, flosculo neutro pedicellato lineari-cylindrico laeviusculo.

Hab. in Persia boreali loco non indicato (*Kotschy n. 718*).

Pedalis, spica bipedalis et longior, spiculae 4 lin. fere longae. Indumento et spica densa affinis praecedenti a qua differt indumento minus denso non sericeo, ligula nulla, flosculo neutro solitario cylindrico etc. A *M. Kotschyi* et *vestita* quoque ligulae deficientia, spica densa, spiculis breviter pedicellatis distincta.

8. MELICA RECTIFLORA Boiss. et Heldr. in pl. Cret. exc. 1847. — Boiss. diagn. XIII. p. 56.

M. glaberrima caespitosa caudiculis erectis ramosis nigricanti-rubellis, culmis erectis foliosis, foliis planis lanceolato-linearibus erectis strictis apice attenuatis praeter marginem remote et obsolete scabridulum laevibus, ligula marginiformi vix perspicua in dentem ovatum oppositifolium culmum amplectentem producta, panicula in spicam erectam anguste linearem laxam contracta, pedunculis pedicellisque strictissimis laevibus hisce spicula brevioribus saepe subnullis, glumis pallide stramineis oblongo-linearibus acutiusculis vix inaequalibus flosculos aequantibus, flosculo fertili unico, palea inferiori glabra elliptico-lineari obtusiuscula sulculoso-nervosa coriacea interiori elliptico-lineari vel elliptica obtusa subcoriacea ad 2 nervos carinantes superne ciliolata, flosculo neutro longe pedicellato ovato-pyriformi truncato flore vix breviori.

Hab. ad rupes prov. Sphakiae Cretae in fauce Hagio Rumeli. Fl. Aprili (Heldr.)

Planta 8—11-pollicaris, foliorum limbus 3—4-pollices longus basi linea una paulo latior, spica 1—2-pollicaris angustissima, spiculae illis *M. uniflorae* fere dimidio minores. Huic speciei flosculo fertili unico affinis ab ea differt ligulae forma, spiculis non longe pedicellatis, glumis angustis etc. Habitu et spicularum magnitudine magis affinis *M. virgatae* Turcz. quae spiculis multifloris aliisque notis longius distat.

9. MELICA FILICULMIS Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 378.

M. rhizomate bulboso-incrassato culmos, filiformes, flagelliformes, steriles fertilesque apice tantum foliatis agente; foliis approximatis, convolutis-filiformibus; panicula lineari, rigida, 2—3-pollicari; ramis 1—7, spiculas 3—4-floras flore unico tantum fertili gerentibus; glumis inaequalibus; inferiore amplissima, obovato-rotundata $3\frac{1}{2}$ —4 lin. longa, $3\frac{1}{2}$ lin. lata, 7-nervia, fulvo-violacea, apice albida; superiore triplo angustiore, paulo minore, floris inferioris gluma superiore subbreviori, $2\frac{1}{2}$ lin. longi, palea inferiori, 11—13-costato-nervia, tuberculata, rubrofusca, ciliis fulvis margine hirta, ad apicem scariosum bifida; superiore paulo breviori, obtusissima.

Hab. in Chile (Gay).

10. MELICA PAECILANTHA Em. Desv. Gram. chil. in Gay fl. Chil. t. VI. p. 379.

M. caespitosa, culmis anni praeteriti culmos fertiles sterilesque, strictos, 10—14-pollicares, basi polyphyllas agentibus; foliis plicatis vaginisque hirtis scabrisque; panicula lineari, rigida, sub-3-pollicari, picta; ramis adpressis, spiculas 1—6-apertas, 5— $5\frac{1}{2}$ lin. longas, 3—5-floras floribus 2—3 fertilibus gerentibus; glumis inaequalibus inferiore minore, oblonga, 4 lin. longa, $1\frac{1}{4}$ lin. lata, 3-nervia; superiore obovato-elongata, $4\frac{1}{2}$ —5 lin. longa, basi attenuata, 5-nervia, dorso violacea, apice albido-scariosa; floris inferioris glumae superiori aequilongi palea inferiore oblongo-elongata, ad api-

cem obtuse bilobum attenuata, 7-nervia, nervo medio lateralibus duobus multo brevior; superiore $\frac{2}{3}$ brevior.

β. *umbrosa*, culmis foliisque subplanis, flaccidis; panicula pauciflora; spiculis virescentibus.

Hab. in provincia Coquimbo regni Chilensis (Gay).

11. MELICA ARGENTEA Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 374.

M. caespitosa, culmis fertilibus steriles nullos gerentibus, 1—2-pedalibus, 6—18-nodis, valde tortuosis; foliis planis v. subconvolutis, utrinque scabris; culmis sterilibus ex anni praeteriti culmo, vaginis cinerascensibus tecto, nascentibus; panicula laxa, 3—5-pollicari, violaceo et argenteo-scarioso nitide variegata; ramis divaricatis, ad summum 2—3-poll. longis; ramusculis 1—5-spiculas sub 2—3-floras, $3\frac{1}{2}$ lineal. gerentibus, glumis spicula paulo brevioribus; inferiore obovato-elliptica, 5-nervia, nervis vix anastomosantibus apice latissima argenteo-scariosa; superiore paulo longiore, $\frac{1}{2}$ angustiore, 5—7-nervia; floris inferioris palea inferiore oblonga glumas superante, inferne 7-nervia, apice rotundata, glumae superiori aequilata. —

Hab. in Chile (Gay, cat. propr. n. 1107); Rancagua (Bertero n. 423).

12. MELICA VIOLACEA Cav. ic. V. p. 47. t. 472, f. 2.

β. *pallida*, glumis 5-linealibus, lutescentibus, basi tantum violaceo tinctis. Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 377. —

Hab. Rancagua regni Chil. (Bertero n. 424). Haec varietas ad M. papilionaceam L. appropinquatur.

13. MELICA MAGNOLII Godr. et Gren.; Godr. et Gr. fl. fr. III. p. 550. — Melica ciliata Vill. (non Lin.)

899 **KOELERIA** Pers.

(Walp. Ann. III. 774.)

1. KOELERIA BALANSAE. Explorat. sc. de l'Alg. II. p. 119. — Bullet. de l. soc. bot. de France 1855 p. 310. —

Annua, caulibus pluribus rarius solitariis erectis v. ascendenuti-erectis, simplicibus v. ramosis glabris v. pilosulis, f. planis dense pubescenti-velutinis, vaginis pubero-velutinis; ligula brevissima erosa ciliata panicula spiciformi ovata v. oblonga densissima; spiculis saepe 4 floris, glumis pilosis, floribus brevioribus, inferiore angustiore lin. lanceolata, superiore ovato-oblonga acuminata; glumella inferiore pilosa, apice bidentata v. breviter bicuspidata, dorso ad quartam partem superiorem aristata, arista molli et in floribus superioribus longiuscula, a glumellae parte superiore secedente. Majo 1832 florifera tecta. — Trisetum (Koeleria) Balansae Coss. et Dur. ap. Balansa pl. Alg. exs. n. 686.

Hab. in collibus petrosis apricis promontorii Cap. Falcon pr. Oran (Balansa). In Algeria hucusque tantum visa. — Planta annua, caet.

2. KOELERIA MICHELII ExpI, sc. de l'Alg. II. p. 120.

Annua, caulibus pluribus, rarius solitariis saepe erectis, simplicibus, rar. b. ramosis pubescentibus v. glabrescentibus; f. angustis planis arefactione saepe demum involutis, c. vaginis molliter pubescentibus v. glabrescentibus; ligula brevissima v. obsoleta; panicula graecili laxiuscula, post anthesin contracto-subspiciformi; spiculis 3—4-floris, flore superiore ad pedicellum redacto; glumis valde inaequalibus, inferiore minuta angustissima lanceolato-subulata, superiore triplo longiore flores subaequante-ovato-lanceolata acuta; caetera vide l. c.

3. KOELERIA CAMPESTRIS Ph. — Linn. XXIX. 44.

K. annua, culmis $1\frac{1}{2}$ —2-pedalibus, erectis, usque ad apicem foliosis; vaginis foliisque superius pubescentibus; panicula angusta, elongata, contracta, 5-pollicari, glauca; spiculis 4—5-floris; glumis aequalibus, $1\frac{3}{4}$ lin. longis; superiore ovato-lanceolata,

trinervia, pubescente, margine lato, scarioso; inferiore paulo brevior, lanceolata, uninervia; palea inferiore $1\frac{1}{2}$ lin. longa, elongata, trinervia, dorso pilosa et margine ciliata, paulo infra apicem aristata; arista dimidiam paleam aequante.

Prope Conception in pascuis occurrit — Culmus nodis circa 5 constat; ligulae satius elongatae, laciniatae; lamina folii supremi fere 6 poll. longa, $2\frac{1}{2}$ lin. lata. — Differt a Trisetto (Koeleria) micrathero Desv. glumis pubescentibus, paleis medio dorso pilosis, spiculis sub-5-floris; a Trisetto subaristato foliis elongatis, spiculis sub-5-floris; glumis acutis, palea dorso pilosa etc.

4. KOELERIA SINAICA Boiss. — Boiss, diagn. XIII. p. 93.

K. annua, culmis pumilis foliosis e basi geniculata erectis, foliis teneris striatis sparsim et deflexe hirtis, limbo e basi latiori lanceolato acuto, ligula brevi hirsuta, spica oblonga laxiuscula inferne saepe lobata ramosa, glumis flosculis paulo brevioribus lanceolatis acutis aequilongis inferiori villosa sublatori superiori carina tantum ciliata vel glabrescenti, flosculis glaberrimis, palea inferiori oblongo-lanceolata acuta subintegra superne ad quartam partem longitudinis dorso arista recta et aequilonga aucta, palea interiori multo breviori hyalina apice bifida.

Hab. in regione *Sinaitica* Aucher No. 3061.

Specimen meum tripollicare, spica limbum folii supremi vix superans; habitus et spicularum magnitudo K. phleoidis a qua ut et ab omnibus Koeleriis annuis arista multo inferius inserta, flosculis glabris, etc. eximie differt.

5. KOELERIA CASTELLANA Boiss. et Reut. — Steud, Synops. p. 293.

β. *velutina* Willk. (Prodr. fl. hisp. I. p. 75): folia dense velutina, thyrsus latior lobatus, spiculis majorib. (K. villosa, hb. Bont).

Hab. prope Aranjuez Hispaniae.

6. KOELERIA SETACEA Pers. Gren. u. Godr. fl. fr. III. 527. Willk. u. Lge. prodr. fl. hisp. I. p. 75. — Steud, Synops. p. 293.

α. *glabra* Godr. l. c. Thyrsus cylindricus, spiculis bifloris, glumis carina scabris ceterum floribus glabris. Culmi apice plerumque glabri (K. vallesiaca Gaud. Cfr. Boiss. Voy. 664. — Steud. Synops. 293.)

β. *ciliata* Godr. l. c. thyrsus cylindrico-oblongus v. ovalis, spiculis bifloris paleisque ad carinam ciliatis. Culmi apice puberuli (K. setacea DC. Steud. Synops. p. 293. *Koeleria vallesiaca* β. *setacea* Koch. K. *tuberosa* Lois. K. *vallesiaca* Rehb. ic f. 1671. *Festuca splendens* Pourr. *Poa pectinacea* Lmk.

γ. *pubescens* Parl. fl. it. I. p. 325. Thyrsus oblongus v. ovalis spiculis bifloris glumis paleisque pubescentibus. Culmi apice puberuli. (Aira vallesiaca Bertol.)

δ. *quinqueflora* Wk. Haec stirps non solum spiculis quinquefloris sed etiam glumis valde inaequalibus differt, caet.

7. KOELERIA CANTABRICA Wk. (prodr. fl. hisp. I. p. 25):

Pluriculmis, viridis, culmis 2—4" l. apice breviter nudis subtomentosis, foliorum vaginis subaristatis glabriusculis, culmum occultantibus, limbo brevi acuto canaliculato intus valde nervoso extus puberulo, thyrso 7—9" l. oblongo compacto nitido; spiculis bifloris, 3" l. glumis subaequalibus floribus brevioribus dorso molliter villosis late membranaceis, palea inferiore longiuscule aristata late membranacea.

Hab. in rupestribus calcareis regionis maritimae Cantabriae passim: Pico de Sarentis pr. Bilbao; Wk. c. Bermeo. 2? Majo.

8. KOELERIA CRASSIPES Lge. (in pl. exsicc. 45. a., pugill. I. p. 42.):

Caespitosa, rhizomate crasso tuberiformi e pluribus foliorum sterilium fasciculis dense congestis composito, vaginis emarcidis pubescentibus integris; foliis radicalibus brevissimis obtusis glaucis rigidis angustissimis cuneatis basi longe ciliatis, ligula brevi truncata dense ciliata; culmis 6—10" l. gracillimis nitidis superne longe nudis, thyrso cylindrico denso vix interrupto $\frac{3}{4}$ —1" l., spiculis 2—3-floris (cum rudimento pedicelli-

formi floris tertii v. quarti), glumis floribus brevioribus valde inaequalibus late lanceolatis ad carinam breviter ciliatis, palea inferiore obtusiuscula. Occurrit forma vivipara. — Willk. et Lge. Prodr. fl. hisp. I. p. 76.

Hab. in Hispania in collibus siccis Castellae vet. (ad Benevente) et in silvis supra el Escorial: Lge., et prope S. Rafael de Guadarrama: Reut. — 24. Jan.

9. KOELERIA MARITIMA Lge. (in ind. sen. hort. Huon. 1859).

Differt a *K. cristata* culmis breviorib. supra medium usque foliatis, foliis filiformibus vix ciliatis panicula brevior et densiore, basi apiceque obtusa, spiculis villosis, glumis ovato-lanceolatis dorso longe et patule ciliatis. — Willk. et Lge. Prodr. fl. hisp. I. p. 76.

Hab. in Hispania ad litora Gallieae (in rupibus circa el Burgo, la Corona, Vigo: Lge). — 24. Jul.

10. KOELERIA CRASSIPES Lange (exsicc. n. 45. a. pugill. I. p. 43):

Rhizoma crassum, tuberiforme, e pluribus foliorum sterilium fasciculis dense congestis compositum; vaginae emarcidae pubescentes, integrae (nec reticulato-fissae), invicem adpressae; folia radicalia brevissima, obtusa, sub leute punctis minimis albis densissime tecta indeque glauca, rigida, angustissima (1 mm. circiter lata), plana vel exsiccatione leviter involuta, curvata, basi subinde pilis longis sparsim ciliata, ceterum glabra, folio caulina latiora, intermedio breviora; ligula brevis truncata, dense ciliata; culmi laevissimi, nitidi gratillimi, articulo superiore longissimo spatio nudo; inflorescentia cylindracea, densa, basi truncata, vix interrupta; spiculae parvae, 2-3-florae cum rudimento pedicelliformi floris tertii (v. quarti), glumae flosculis breviores, late lanceolatae, acutiusculae, nervo dorsali breviter ciliatae, valde inaequales (inferior spiculae dimidia longitudine); palea inferior obtusiuscula, superioris late bidentatae longitudine. Occurrit monstrositas floribus viviparis. — Willk. et Lge. Prodr. fl. hisp. I. p. 76.

Hab. in collibus siccis Castellae vet. (ad Benevente), et in silvis supra El Escorial Lge. et pr. S. Rafael de Guadarrama. Reut.

11. KOELERIA PHELOIDES Pers. (Syn. I. p. 97):

Multiculmis, viridis, culmis 4-42" l. adscendentibus, foliis planis angustis vaginisque pubescentibus, thyrso $\frac{1}{2}$ -2' l. denso oblongo-cylindrico, spiculis 2-5-floris, nitidulis; glumis valde inaequalibus floribus brevioribus ad carinam scabris, palea infer. tuberculata 5-nervia aristas tenem rectam scabram gerente. — Lge. et Willk. Steud. Synop. 294. Prodr. fl. hisp. I. p. 74. Festuca phleoides Vill. et Desf. *T. cristata* L. *Bromus alopecuroides* Lge. ex Boiss. *Poa thyphoides* Pourr. *Lophochloa phleoides* Rehb.

z. gemina Willk. l. v. spiculae 2" l. palae inferiores nervis tuberculisque prominentibus, aristae $\frac{1}{2}$ - $\frac{3}{4}$ " l. e thyrso valde prominentes. — Variat magnopere longitudine thyrsorum, glumis paleisque pubescentibus glumis pubescentibus et paleis glabris, glumis paleisque glabris. (*K. brachystachya* DC. ex Boiss. Voy. Steud. Synops. p. 294.)

SCLEROPOA Griseb.

1. **SCLEROPOA PHILISTAEA** Boiss. diagn. XIII. p. 60.

Scl. glabra annua radice fibrosa, culmis pluribus basi geniculatis dein erectis brevibus rubellis, foliis laevibus anguste linearibus apice setaceo-acuminatis siccitate subconvolutis radicalibus numerosioribus, culmeis paucis limbo brevi strictiusculo, ligula oblonga acuta fimbriata, panicula ovato-oblonga ramis 3-5 spiculatis erecto-patulis spiculis brevioribus pedicellisque tandem saepe deflexis acute angulatis laevibus, spiculis pallide rubellis compressis eximie distichis oblongis 10-13 floris basi saepe attenuatis, glumis parvis lanceolatis acutis acute carinatis flore proximo paulo brevioribus, axi parce hirtula non fragili, flosculus oblongo-linearibus, palea inferiori subcoriacea trinervi basi obtuse superne acute carinata glabra vel inferne parce et brevissime hirtula apice brevissime membranacea rotundata, carina vel mutica vel in mucronulum apice non longius lente vix perspicuum sub apice ahenti, palea superiori breviori oblongo-lineariter bicarinata ad carinas scabridula.

Hab. in arena lutea mobili regionis Philistaeae circa Gaza in Palaestina australi. Legi Aprili 1846.

Semi-1 pedalis, folia brevina, panicula 2—3 pollicaris, spiculae 5—6 lineas longae 2 vel paulo amplius latae. Affinis *Scleropoae maritimae* Link quae egregie differt spiculis minus regulariter distichis angustioribus, axi fragili, flosculis glaberrimis magis elongatis acute quinquenerviis nervis lateralibus approximatis. Nostra species habitu, et spiculis distichis magis refert *Catapodium Siculum* = Link *Triticum unioides* Ait. spiculis sessilibus statim distinguendum et flosculis apice tantum acute carinatis transistum inter Scleropoas et Catapodia generice forsitan non satis distincta praebet.

2. SCLEROPOA PUMILA Boiss. — Boiss. diagn. XIII. p. 61.

Sc. annua glabra, culmis numerosis pumilis exterioribus basi geniculatis omnibus foliosis longitudine inaequalibus scabridis, foliis inferioribus paucis lineari-setaceis, caulnorum vaginis dilatatis striatis laevibus elongatis limbo lauceolato apice subulato folii supremi paniculam saepe aequanti, ligula oblongo-lanceolata acuta lacera, panicula oblonga ramis brevibus angulatis scabridis divaricatis ramulosis ad spicularum ortum infracto-flexuosis, spiculis sessilibus super ramulum angulo recto patentibus angustissime linearibus, glumis aequalibus anguste lineari-lanceolatis obtusiusculis acute carinatis flosculo inferiori fere dimidio brevioribus, axi elongata, flosculis strictis invicem plus eorum longitudine media distantibus linearibus, palea inferiori lineari nervis tribus validis percursa subcoriacea virenti margine et apice brevissime albo-membranacea carinata obtusiuscula ad nervos superne scabrida, superiori aequilonga lineari obtusa ad 2 nervos scabridula.

Hab. in deserto Arabiae petreae Palaestinae conterminae. (Boiss.). in desertis Alexandriae (Cadet de Fontenay).

Culmi saepius 3—4 rarius 5—7 pollicares, paniculae $1\frac{1}{2}$ —2 poll. longae ramulis spiculis brevioribus, spiculae 3—4 lineas longae angustissimae tereti-angulatae. Affinis *Scler. divaricatae* Link = *Festuca divaricatae* Desf. quae egregie differt culmis elatioribus vix basi geniculatis, vaginis foliorum culmeorum non dilatatis inflatis, spiculis multifloris 5—12 lin. longis crassioribus, paleis obsolete nervosis inferiori non scabrida.

3. SCLEROPOA MEMPHITICA Boiss. — Boiss. diagn. XIII. p. 62. (cfr. infra genus *Cutandia* Willk.)

Sc. annua glabra, culmis numerosis basi valde geniculatis dein erectis laevibus, foliis fere omnibus culmeis vaginis striatis laevibus latis subinflatis limbo lanceolato subulato-attenuato vaginae aequilongo eo folii supremi paniculae saepius aequilongo ligula oblonga acuta lacera, panicula oblonga ramosissima, ramis articulo-fragilibus patentibus angulatis scabridis inferioribus elongatis omnibus divaricatis ramulosis spiculis subsessilibus ramulo angulo recto insidentibus oblongo-linearibus trifloris glumis linearibus acuminatis rigidis subinaequalibus carinatis superne carina parcissime scabridis caeterum glabris flosculo inferiori dimidio brevioribus, flosculis strictis linearibus acuminatis invicem quarte parte eorum longitudinis distantibus, palea inferiori glabra trinervi carinata obsolete ad carinam superne scabridula vel omnino laevi coriacea virenti anguste lineari superne attenuato-acuminata albedo-membranacea apice in denticulum acutum minutum abeunti, carina in aristulam denticulo longiorem producta, palea superiori breviori lineari obtusa ad 2 nervos scabrida.

Hab. in arena mobili ad pedem rupium in vallibus Sinaiticis Wadi Mokatteb, Wadi Scheick etc. (Boiss.), in desertis Aegyptiaco-Arabicis Thebaidis (Husson).

Dactylis Memphitica Sprengl.

Planta $1\frac{1}{2}$ —1 pedalis inferne saepe arena mobili sepulta, foliorum superiorum limbus saepe 2—3 poll. longus, vaginae $2\frac{1}{2}$ —3 lineas saepe latae, panicula ea praecedentis amplior propter ramos longiores magis effusa. Habitu et vaginis latis foliorum praecedenti affinis ab ea differt ramis paniculae elongatis, spiculis breviter pedicellatis

et praesertim flosculis inter se minus remotis axi minus strictis fere laevibus attenuato-subulatis apice longius membranaceis et carina producta longiuscule aristulatis. A *Scleropo*a divaricata notis datis longius distat.

Ad 892. **CUTANDIA** Willk.

(Willk. in Bot. Zeit. 1860.)

Spiculae 3—4-florae compressae, in paniculam di-trichotome ramosam divaricatam ordinatae, articulato-fragiles. Glumae inaequales, floribus breviores, acutae mucronatae uninerviae membranaceae. Palea inferior trinervia valde carinata acuta bidentata breviter aristata, superior bifida acuta. Caryopsis fusiformis obtusa facie interiore lato-canaliculata.

Dicavi cl. *Cutanda*, prof. Madrit. de flora Castellana optime merito. — Willk. et Lge. Prodr. fl. hisp. I. p. 86.

1. **CUTANDIA SCLEROPOIDES** Willk. I. c. 130:

Pluriculmis, culmis geniculato-ascendentibus basi saepe radicantibus $\frac{1}{3}$ —1' l. saepe ramosis, foliosis, vaginis glabris subinflatis, suprema paniculam involucrante, ligula elongata, oblonga, lacera; paniculae 2—4" l. irregularis ramis crassis triquetris ternis, longioribus bis v. ter dichotomis ramulisque sub anthesi divaricatissimis, spiculis 4" l. lanceolatis, pallide virentibus glabris, floribus remotis, palea inferiore lineari-lanceolata acuminata acutissima aristam brevem rectam sub apice brevissime bidentata gerente. — Willk. et Lge. Prodr. fl. hisp. I. c. — *Dineba divaricata* RS. *Dactylis memphitica* Spr. *Festuca memphitica* (Steud. Synops. p. 302. 10?) Hab. in Algeria, Sahara algeriensi, Aegypto, Arabia petraea, Turcia, prov. caucasicis Hispania (in arenosis maritimis ad promont. Cabo de Gata).

899. **FESTUCA** L.

(Walp. Ann. III. 775.)

(Heuffel: Enumeratio plant. Banatus Temesiensis in Verh. der zool.-bot. Gesellsch. zu Wien, 1858 p. 232.)

1. **FESTUCA OVINA** L.

Panicula coarctata, racemosa, secunda; ramis inferioribus ramosis, spiculas 3—5 gerentibus, super. simplicibus, rachi ramulisque angulatis, scabriusculis; spiculis oblongis, teretiusculis, 4-floris; valvis inaequalibus, majore 3-nervi; paleis enervibus glabris sub lente marginibus aristaque paleam ferè longa. ciliato-asperis; foliis convoluto-setaceis, margine serrulato-scabris, ligula biaurita; culmo supra medium nudo, superne tetragono; radice fibrosa.

α. *vulgaris* Koch, Rchb. 1530.

β. *alpina* Koch, Rchb. 1533.

In pratis et pascuis siccis, in alpès usque. Mai—Aug.

2. **FESTUCA DURIUSCULA** Linn :

Panicula patente subsecunda, parum nutante, racemosa; ramis inferioribus ramosis, spiculas 5—6 gerentibus, super. simplicibus; rachi ramulisque angulatis scabris; spiculis oblongis, compressis, sub-5-floris; valvis inaequalibus, majori 3-nervi subaristata paleis enervibus, exteriore aristata, arista paleam fere longa; foliis convoluto-setaceis; rigidis, margine serrulato-scabris; ligula biaurita; culmo ultra medium foliato, angulato, superne scabriusculo; radice fibrosa. — Rchb. 1538,

β. *umbrosa*: foliis filiformibus.

γ. *pauciflora*: spiculis subtrifloris.

δ. *hirsuta* Host: foliis evidenter ciliatis, paleis hirsutis.

In pratis et pascuis collium montiumque. Mai—Jun.

3. *FESTUCA GLAUCA* Schrad.:

*Glauc*a, panicula patente racemosa; ramis inferioribus ramosis, spiculas 5—6 gerentibus, super. simplicibus; rachi ramulisque angulatis, scabris; spiculis oblongis, compressis, sub-5-floris; valvis inaequalibus, majore 3-nervi; paleis nervibus, exteriore aristata; arista vix dimidium paleae longa; foliis convoluto-setaceis, rigidis, glabris; ligula biaurita; culmo ad medium foliato, superne angulato; radice fibrosa. — Rehb. 1542.

β. *umbrosa*: spiculis multifloris aristatis, arista paleam longa; foliis elongatis culmum subaequantibus.

γ. *hirsuta*: spiculis hirsutis; paleis ut in β. aristatis.

In apricis et sylvaticis montium calcareorum. Mai. Jun.

4. *FESTUCA VAGINATA* W. Kit.

*Glauc*a; panicula sub anthesi patente, subsecunda, ramosissima, elongata, laxa; ramis glabriusculis infer. ramosis, spiculas 12—16 gerentibus, summis subsimplicibus racemosis; spiculis 5—6-floris, valvis inaequalibus, inferiore 5-, superiore 3-nervi, paleis obsolete nervosis, acutis; foliis linearibus, elongatis, convolutis, rigidis glaberrimis, ligula biaurita; culmo ad paniculam fere vaginato; radice stolonifera. — Steud. Synops. 307.

In arena mobili legionum Illyrico- et Tentonico-banaticarum vulgatissima. — Mai. Jun.

5. *FESTUCA RUPICOLA* Heuff.

Panicula racemosa, subsecunda, stricta, ramis scabris, infer. solitarius geminisve, spiculas 4—5 gerentibus, super. racemosis simplicibus; spiculis 4—5-floris; valvis inaequalibus lineari-subulatis, infer. 5-, super. 3-nervi, paleis obsolete nervosis, exter. pilosiuscula marginibus ciliata, in aristam se dimidium breviorum abeunt; foliis setaceo-filiformibus brevissimis margine serrulato-scabris, ligula truncata, breviter biauriculata; culmo striato, superne angulato, glabro; radice caespitosa.

In rupestribus umbrosis montis Domagled ad Thermas Herculis. Mai. Jun.

6. *FESTUCA HETEROPHYLLA* Lam. Syn. — Steud. Synops. 308.

F. nemorum Leyss, Rehb. 1558.

In sylvis montanis.

7. *FESTUCA NIGRESCENS* Lam.

Paniculae subsecundae nutantis ramis solitariis geminisve, rachique scabris, inferioribus ramosis; spiculis oblongis, compressis sub-5-floris, variegatis; valvis ovatis acutis, majore 3-nervi; palea inferiore obsolete nervosa; carina scabriuscula, aristata, arista vix paleae dimidium longa; foliis subconformibus, radicalibus convolutis, culmeisque elongatis scabriusculis; ligula brevissime biaurita; radice fibrosa. — Rehb. 1559.

F. heterophylla var. Steud. Synops. 308.

In pasceis inprimis rupestribus alpium. Jul. Aug.

8. *FESTUCA RUBRA* L. Rehb. 1557. — Steud. Synops. 308.9a. *FESTUCA PSEUDOESKIA* Boiss. voy. p. 673.

Radice caespitosa fibrosa, f. durissimis rigidis involutis pungentib. laevib. culmeor. limbo patenti, ligula oblonga truncata-lacera, culmis brevib. 1—2 pedilibus rigidis, paniculae erectae collectae elongatae ramis brevibus, spiculis subsextifloris pallide variis, flosculis arcte imbricatis, glumellis subaequalibus inferiori scariosa carinata obtusa breviter acuminata, superiore bicarinata ap. obtusa subtruncata.

F. pseudoeskia El. n. 195.

In glareosis summis regionis nivalis, Sierra Nevada, alt. 9000—10500. Fl. Aug.

9b. *FESTUCA GRANATENSIS* Boiss. voy. p. 673. tab. 179.

Radice fibrosa caespitosa, foliis planis siccitate convolutis longissimis duris rigidis extus laevibus intus valde striatis scabridis, ligula elongata, in setas profunde fissa,

culmis 3—4 pedibus laevibus, panicula longissima erecta, ramosa contracta spicaeformi subsecunda interrupta, spiculis subsexfloris, fl. nitidis scariosis arcte imbricatis, axi ad flosculos nodulosa glumis inaequalibus omnino scariosis hyalinis acutis, glumellis aequalibus inferiore 5-nervi scariosa, ap. obtusiuscula erosa, interiore bicarinata acutiuscula ad nervos scabrida.

F. Granatensis Boiss. El. n. 198. — *Poa scariosa* Lag.?

In siccis reg. alp. montium Granatensium vulgatissima, alt. 4000—7500'.

10. *FESTUCA CYLLENICA* Boiss. et Heldr. in pl. Graec. exs. 1849. — Boiss. diagn. XIII. p. 58.

F. perennis glaberrima dense caespitosa, radice fibrosa, foliis radicalibus dense congestis anguste linearibus secus paginam superiorem scabram plicatis tenuiter cylindricis laevibus rigidis erecto-subarcuatis acutis subpungentibus caespites lubricos formantibus, caulinis paucis brevibus minus rigidis convolutis, ligula ovata brevi, culmis tenuibus erectis, panicula erecta contracta brevi e spiculis paucis strictis constanti, spicularum pedicellis solitariis vel binis setaceis scabridis spicula plerumque brevioribus, spiculis subtrifloris stramineis, glumis lutescentibus oblongis obtusis inferiori breviori angustiori uninervi superiori obsolete trinervi flosculis tertia parte breviori, axi glabra in articulos facile secedenti, flosculis glaberrimis laevibus linearibus teretibus, palea inferiori marginibus convoluta subnervi apice membranaceo-marginata in aristulam brevissimam attenuata, interiori subbreviori acutiuscula ad 2 nervos carinales superne sub lente hirtella.

Hab. in saxosis regionibus alpinae montis Kyllenes Peloponnesi alt. 5—6000' (Heldr.).

Folia radicalia $\frac{1}{2}$ —1 pedalia illis *F. variae* fere tenuiora, culmi sesquipedales, panicula pollicaris e spiculis 6—10 constans, flosculi vix $2\frac{1}{2}$ lin. longi. Species distincta *F. dimorphae* Guss. inter omnes magis affinis, haec a nostra differt foliis planis, panicula magis multiflora, glumis late membranaceis, flosculis evidenter nervatis etc. Utraque a grege *F. variae* spiculis paucifloris, flosculis teretibus vel dorso subcompressis nec lateraliter compressis egregie differunt et hac nota ad genus *Triodiam* glumis flores superantibus flosculisque apice tridentatis caeteram diversum accedunt.

11. *FESTUCA SCLEROPHYLLA* Boiss. et Hob. in Kotsch. pl. Pers. her. 1846. — Boiss. diagn. XIII. p. 59.

F. perennis glabra glaucescens radice fibrosa culmos crassos valde elatos remote et stricte filiosos fasciculosque foliorum sterilium edenti, squamis fasciculorum sterilium sensim in folia aebuntibus, foliis rigidis duris erectis longissimis linearibus siccitate subconvolutis concoloribus valde striato-nervis ad nervos et praesertim margines scabris, cauliorum superiorum limbo stricto vaginae aequilongo, ligula oblonga apice lacera, paniculae erectae ramis longe denudatis diffuso-pubentibus scabridis inferioribus binis, pedicellis scabridis spicula saepius brevioribus, spiculis albedo-virentibus 6—7 floris, axi scabrida, glumis lanceolatis acutis valde inaequalibus, palea inferiori punctulato-scabra conspicue quinque-nervi acutiuscula apice brevissime mucronulata, interiori acuta bifida margine scabrida, ovario apice hirtulo.

Hab. in schistosis montis Elbrus prope Derbent Kotschy n. 245.

Culmi 3—4 pedales, panicula 8—10 pollices longa ramis inferioribus parte nuda 2—3 pollices longis. Folia fasciculorum pedem vel sesquipedem longa. Spiculae magnitudinis *F. spectabilis* Jan quae nostra affinis differt foliis tenuioribus non rigidis brevioribus multo minus scabris siccitate non convolutis, panicula magis multiflora, flosculis punctulatis nec scabris etc. *F. drymeia* spiculis multo minoribus radicisque indole longius distat.

12. *FESTUCA BROMOIDES* L. — *Vulpia sciuroides* Gmel. — Lge. et Willk. Prodr. II. hisp. I. p. 91.

β. gracilis Lge. pug. 50! Culmis 3—4" l., capillaribus, panicula brevi e spiculis 2—5 constante, aristas longioribus.

γ. longearistata Wk. l. c. Spiculis 5—8-floris, aristis palea inferiore duplo v. subtriplo longioribus. — (V. Broteri Boiss. et Reut. pug. 128. Festuca Steud. Synops. p. 304. *Vulpia Myurus* vel *tenella* Boiss. voy. *F. hybrida* Brot.)

Hab. *β.* in Hispania, in Gallecia et pr. El Escorial (Lge.), *γ.* in Cast. nova, Extremadura et Baetica (Schousb., Lge.).

13. **FESTUCA ALOPECURUS** Schousb. Steud. Synops. p. 303. — *Vulpia Alopecurus* Lk. Lge. et Willk. Prodr. fl. hisp. I. p. 92.

α. vulgaris Boiss. Voy. II. 670. Spiculae 7—9-florae in racemum subsimplicem congestae. Paleae margine longe ciliatae, aristam suam aequantes.

β. glabrata Lge. pug. I. 50. Humilis, culmo ramosissimo. Racemus simplex. Spiculae 5—6-florae glaberrimae. Aristae paleis breviores.

γ. sileatica Boiss. l. c. Racemus elongatus basi ramosus strictus. Spiculae 7—9-florae. Paleae margine ciliatae arista sua subduplo breviores.

δ. lanata Boiss. l. c. Racemus subsimplex. Spiculae subquinqueflorae. Paleae sericeo-villosissimae aristam subaequantes.

Hab. in sabulosis Hispaniae regionis calidae, in Italia, Graecia, agro Tingitano.

13. **FESTUCA (VULPIA) TENUICULA** Boiss. et Reut. (diagn. 47). — Differt a *Festuca Michellii* Bertolon.:

Culmis pumiliis, panicula secunda, glumis subaequalibus, palea floris inferioris submutica, florum superiorum breviter aristata. — Lge. et Willk. Prodr. fl. hisp. I. p. 93

Hab. ad radices collium Aranjuez prope lac. Ontigola (Reut.). — Majo.

14. **FESTUCA DURIUSCULA** L. — Steud. Synops. p. 306. Lge. et Willk. Prodr. fl. hisp. I. p. 93.

α. genuina Godr. (Fl. de France III. 572): culmi 1—2' l., basi saepe geniculata: folia elongata laevia recta viridia. Panicula 2—3" l.; spiculae 4—7-florae 4—5" l., saepissime variegatae. Glumae valde inaequales, palea inferior arista ea dimidio brevior. Variat spiculis glabris et pubescentibus. (*F. hirsuta* Host. Steud. Synops. p. 306. *F. cinerea* Vill.)

β. clatior Boiss. (Voy. II. 670): culmi 2—3' l. stricti; folia elongato-filiformia laevia vel scabriuscula. Panicula 4—6" l. angusta stricta. Spiculae 5—6" l., 6—7-florae glabrae virides ut tota planta. Glumae minus inaequales. Palea inferior in aristan brevem producta v. mucronata.

γ. glauca Koch Syn. 398! Rehb. ic. f. 1542. (*F. glauca* Schrad. non Fr.): Culmi $\frac{3}{4}$ —1 $\frac{1}{4}$ ' l. stricti, basi saepe geniculati longe nudi. Folia brevia saepe recurvata rigidiora glauca. Panicula 1—3" l. saepe variegata. Variat glumis plus minus inaequalibus, palea inferiore aristam eam dimidio breviorer gerente vel mucronata.

δ. rivularis Boiss. l. c. (*F. rivularis* Boiss. El. Steud. Synops. p. 308). Culmi 1—2' l. basi geniculati. Folia brevia, culmea radicalibus latiora. Panicula nutans diffusa. Pedunculi inferiores longi patentes. Spiculae suboctoflorae rubro-variegatae, floribus dissitis. Glumae subinaequales. Palea inferior subquinquenervia breviter aristata. (Folia e descript. plana. An revera species distincta.)

ε. Clementei Boiss. l. c. Dense caespitosa. Culmi 8—9" l. longe nudi graciles erecti. Folia brevia arcuata glauca. Panicula 1—2" l. spicaeformis densa. Spiculae 3—5-florae. Variat foliis scabris et laevibus, floribus pallidis satis longe aristatis. (*F. pumila* Wk. Enum. 66. non Vill.) et rubro-violaceis breviter aristulatis v. mucronatis (*F. Clementei* Boiss. El. Steud. Synops. p. 306.)

ζ. pyrenaica Wk. (*F. dura* DC.) Humilis. Folia glauca culmos subaequantia. Panicula parva densa.

Hab. in Hispania.

15. *FESTUCA INDIGESTA* Boiss. El. 64. — Steud. Synops. 307. — Lge. et Willk. Prodr. fl. hisp. I. p. 94.

α. *genuina* Wk. Culmi pedales. Folia erecta 3—4" l. pungentia. Panicula 1½—2" l. Spiculae 4—5" l. 5—8-florae. Arista tertiam paleae partem aequans.

β. *Aragonensis* Wk. Dense caespitosa. Culmi 4—9" l. gracillimi. Folia breviora et tenuiora arcuata. Panicula ¾—1½" l. racemosa, laxior. Spiculae 6—8-florae, 3—4" l. Arista palea subdimidio brevior.

γ. *hystrix* Wk. (*F. hystrix* Boiss. El. 63. Steud. Syn. 307. *F. duriuscula* var. *hystrix* Boiss. voy. I. c. *F. curvifolia* Lag.) Dense caespitosa. Culmi gracillimi 3—6" l. Folia abbreviata recurvata intricata rigidissima. Panicula racemosa ½—¾" l.; spiculae 3" l. sub quadriflorae. Flores breviter aristatae.

Hab. in Hispania.

16. *FESTUCA SCABERRIMA* Lge. (pug. I. p. 51):

Caespitosa, culmis basi geniculatis deinde strictis enodibus 1½—2' l., superne longe nudis apice non angulatis, foliis rectis angulato-setaceis scabris glaucis rigidis, culmeis 1—2 canaliculatis vagina longissima rubescente adpressa munitis, paniculae 3—6" l. sub anthesi patulae ramis inferioribus geminis inferne longe nudis, spiculis satis longe pedunculatis, subquinquefloris, 4" l. virentibus vel rubentibus, glumis parum inaequalibus, floribus laxo imbricatis, palea inferiore mucronata apicem versus scabriuscula plus minus conspicue nervosa. — Lge. et Willk. Prodr. fl. hisp. I. p. 94. *F. duriuscula* var. *adscendens* Lge. exsicc. hisp.

Hab. in graminosis calcareisque apricis regionis mont. regni Granat. (Sierra de Jarana Wk.) et Jienens. (Cerro Fuendelapenna pr. Jaen Lge.).

17. *FESTUCA ARUNDINACEA* Schreb. — Steud. Synops. p. 310.

β. *glaucescens* Boiss. voy. fl. p. 675. Folia brevia glaucescentia, basilaria angusta. Culmi 1—2' l. Panicula contracta erecta. Spiculae variegatae. — Lge. et Willk. Prodr. fl. hisp. I. p. 97.

Hab. in Hispania in Castella nova et regno Granat.

18. *FESTUCA GRACILIS* Moench. — Steud. Synops. p. 316. — *Brachypodium sylvaticum* RS. Lge. et Willk. Prodr. fl. hisp. I. p. 111.

β. *multiflorum* Wk. l. c. Spica erecta. Spiculae 15—20-florae, 12—15" l. aristis florum superiorum palea longioribus erecto-patulis, non penicillatis. An species propria?

Hab. prope Barcinonem Hispaniae.

19. *FESTUCA (BRACHYPODIUM) MUCRONATUM* Willk. (Prodr. fl. hisp. I. p. 111):

Caespitosum, culmis 1½—3' l. apice nudis, basi non ramosis, rigidis, foliis glaucis elongatis longissime acutatis rigidis erectis primo planis postea canaliculatis vel convoluto-subulatis, supra scabridis. Spica 3—6" l. erecta, laxa, spiculis conspicue pedunculatis 8—14" l., 6—16-floris glabris, palea inferiore valde nervosa obtusa mucronata superiorem superante.

Hab. in dumosis saxosisque regionis mont. Hispaniae orient. et austral. passim.

20. *FESTUCA DISTACHYA* Willd. — Steud. Synops. p. 317. — *Brachypodium distachyum* PB. Lge. et Willk. Prodr. fl. hisp. I. p. 112.

α. *genuinum* Willk. l. c. Spica 1—3-stachya, spiculis 6—12-floris. Culmi 3—7" l. fasciculati, saepe diffusi.

β. *pumilum* Wk. l. c. Submonostachyum, spicula 5—6 flora. Culmi 1½—5" l. solitarii v. fasciculati, erecti.

γ. *multiflorum* Wk. l. c. Spica 4—5-stachya, spiculis 12—24-floris. Culmi fasciculati ½—1' l. erecti.

Hab. in arenosis, cultis, ruderalis regionis inferioris et montanae Hispaniae.

21. *FESTUCA* (*NARDURUS*) *LACHENALII* Godr. fl. Lorr. 187. — Lge. et Willk. Prodr. fl. hisp. I. p. 115. — Steud. Syn. p. 302. — *N. Poa* Boiss. Voy. Esp. II. 667. *Festuca Lachenalii* Koch.

Hab. in arenosis, cultis regionis inferioris, montanae et alpinae Hispaniae passim et raro.

22. *FESTUCA* (*NARDURUS*) *TENUIFLORA* Schrad. — Steud. Syn. p. 115. — *Nardurus tenellus* Rehb. exsicc. 105. Godr. et Gren. Fl. de France III. p. 616. Lge. et Willk. Prodr. fl. hisp. I. p. 115.

2. *genuinus* Godr. Palea inferior mucronata v. breviter aristata. Culmi sat robusti humiles. (*Triticum unilaterale* L. *Brachypod. unilaterale* RS. Reich. ic. f. 1371.)

3. *aristatus* Parl. fl. it. I. 485. Palea infer. aristam ea longiorem vel eam aequantem gerens. Culmi graciles strictiores altiores. (*N. tenuiflorus* Boiss. Voy. *Triticum Nardus* DC. *Trit. tenellum* Viv. *Trit. psilanthum* Lk. *Festuca tenuiflora* Schrad. *Fest. hispanica* Kth. *Brachypodium tenuiflorum* RS. Rehb.)

Hab. in cultis arenosisque regionis inferioris Hispaniae passim et raro.

23. *FESTUCA* (*NARDURUS*) *SALZMANNI* Boiss. (Voy. t. 178 B.):

Glaberrimus, culmis 3—9 l. inferne gracillimis geniculato-ascendentibus, foliis convolutis setaceis, spica 1½—5 l. arcuata, initio anguste cylindrica subulata, spiculis 1½—2½ l. 4—5-floris adpressis subsecundis, glumis obtusissimis, palea inferiore obtusa mutica. — Lge. et Willk. Prodr. fl. hisp. I. p. 116. — *Triticum filiforme* Salzmann.

Hab. in arenosis regionis calid. montan. et subalp. Hispaniae in regno Granatensi et Castell. nova ad 1000—6500'.

24. *FESTUCA LOLIUM* Balansa pl. Alger. Cosson et Durieu (Bulet. de la Soc. bot. de France 1855. p. 311).

Planta perennis, caespitosa, caudice foliorum steriles plures et caules saepius sub-solitarios edente; foliis radicalibus plurimis, approximatis distichis vaginis sese invicem obtegentibus, linearibus, canaliculato-carinatis, glabris, rigidis; spica rigida, simplici, recta, caulis partem inferiorem longitudine aequante v. superante; spiculis oblongis 5—8-floris, glabris, sessilibus, alternis, rachi adpressis, glumis subaequalibus, concavis haud carinatis, apice obtusis, floribus subdimidio breviorib. v. eos subaequantibus; glumella inferiore glabra, ovata, concava haud carinata, obtusa mutica caryopsis macula hilari brevissima notata.

Hab. in pratis pr. Batua Algeriae.

25. *FESTUCA DIVERSIFOLIA* Boiss. et Bal. (in pl. ex. exsicc. n. 136 et 746. Bull. de la Soc. de France 1857 p. 306):

Caespitosa. Culmi laeves, cylindrici, basi sat compressi. Folia etiam inferiora limbo instructa, sterilia saepius involuta, filiformia, glabra, fertilia plana, latiora; ligula brevis truncata. Folia 2—3 inferiora stolouum steriliuum medio inferiore vaginarum bulbiforme incrassata. Vaginae glabrae, laeves. Spiculae saepissime triflorae, in paniculam lauceolatam dispositae, ramis 5—7-natis scabris inaequalibus. Glumae oblongae lanceolatae, acutae, glabrae, tertio parte flosculis breviores inferior uninervia, superior trinervia. Palea inferior mutica, trinervia, dorso carinata; palea superior bicarinata, carinis scabris, integra superiorem subaequans. Lodiculae 2 acutae, integrae. Antherae oblongae. Ovarium glabrum, stylis terminalibus. Caryopsis oblongo-lanceolata, canaliculata, paleis inclusa isque contigua, macula hilari punctiformi.

Hab. in monte Sipylo prope Magnesia, et in regione montana m. Tauri, et Ali-Dagh prope Cesaream.

26. **FESTUCA TILINGII** Regel et Til. (Florula Ajanensis in X. Mém. de la Soc. d. Nat. de Moscou T. XI. p. 125):

Rhizomate fibroso; foliis glaberrimis, rigidis, glaucis, involuto-subsetaceis; ligula nulla; paniculae subcontractae ramis semiverticillatis vel rarius geminis, scabriusculis; spiculis linearibus, 9—12-floris; valvula inferiore acuta, decidua; valvula superiore truncata, ciliata persistente. 4.

Radix perennis, fibrosa. Culmus usque bipedalis. Panicula elongata, subcontracta, densa, usque 9 pollices longa.

F. convolutae Kunth (*Atropidi convolutae* Ledeb. fl. ross. IV. p. 389) et *F. nervosa* Hook. fl. boreal. Am. tab. 232 affinis. Priori imprimis habitu similis, quae tamen differt ligula elongata spiculis 2—8-floris, valvulaque inferiore truncata. — *F. nervosa* Hook. folia non habet convoluta, paniculam autem laxiorem, et valvulam superiorem apice 2-dentatam.

Hab. in regione Ajanensi Asiae orientalis.

27. **FESTUCA NUBIGENA** Jungh. in ms. — Büse in pl. Jungh. III. p. 346.

Panicula angusta, pauciramea, cernua, rhaehi pedicellisque longiusse, hirsutis; spiculis sub 7-floris, gluma infera breviora, glumella infera lanceolata in aristam brevem denticulatam attenuata, glumella supera lanceolata ap. bifida denticulata; f. radicalib. permultis aequae ac caulinis convolutis, canaliculatis, glabris; ligula conspicua.

Hab. ins. Javae in montib. Lawu et Merbabu. Caespites ibi formati insularum adinstar, vallib. intermediis 1—3 pedalib. segregatos. (Jungh. in sched.)

28. **FESTUCA ACANTHOPHYLLA** Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 431.

F. robusta, rhizomate crassissimo; culmo bipedali et ultra, tereti, duro, laevi, vaginis foliorum sanguineo fuscis basi non tunicato; foliis coriaceis, plicato-cylindraceis, crassis, laevissimis, incurvis, duris, 4—8-pollicaribus, apice pungentibus; ligula subnulla; panicula laxiflora, 6 pollicari; ramis multifloris, inferne 3—4 verticillatis, erectis; spiculis $4\frac{1}{2}$ —6-linearibus, 6—7-floris, oblongis, saepe viviparis, pictis; glumis inaequalibus; floribus convexis; palea inferiore acuta, mutica; antheris 3, linearibus, $1\frac{1}{2}$ -linealibus; ovario glabro.

Hab. in Cordilleras de Cauquenes, valle de los Cipreses, et prov. de Colchagua, Chile (Gay).

29. **FESTUCA** (*Eufestuca* Gris.) **TUNICATA** Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 434:

F. erecta, 2—2 $\frac{1}{2}$ -pedalis et ultra, gracilis; culmo tereti-angulato, superne scabriusculo, usque ad apicem foliato; basi tunica sesquipollicari vaginarum cinerascensium et apice lacerarum arcuatis circumdata; foliis herbaceis, convolutis, anguste linearibus, 5—6 pollicaribus; ligula subnulla; panicula laxiflora, rigida, angusta, 6—9-pollicari, ramis setaceis, multifloris, erectis, inferne 4—6-verticillatis; spiculis $3\frac{1}{2}$ —4 $\frac{1}{2}$ -linearibus, 4—5-floris, ante anthesin lanceolato-acutis; glumis obtusiusculis; floribus convexis; palea inferiore acuta, mutica; antheris 3 linearibus; ovario glabro.

Hab. ad Quillota. Chile. (Bertero n. 995.)

30. **FESTUCA** (*Vulpia*) **ERIOLEPIS** Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 128.

F. annua, caespitosa, culmis gracilibus, basi ramosis, 4—8-pollicaribus; foliis convolutis-setaceis, intus pubescentibus; ligula brevissima, biarista; panicula 1—2-pollicari, contracte subspiciformi, stricte erecta, sub-anthesi patente; spiculis 4—5-floris, 2 $\frac{1}{2}$ —3 $\frac{1}{2}$ lin. longis; glumis inaequalibus, inferiore 1-nervia, acuta, $\frac{1}{2}$ floris aequante, superiore ovato-lanceolata, valide 3-nervia, acutiuscula, inferiore $\frac{1}{4}$ vel $\frac{1}{2}$ longiore; floribus vel maturis elliptico-lanceolatis, 2—2 $\frac{1}{2}$ lin. longis; palea inferiore concava, pilis rigidis, brevibus, aculeiformibus hirta, tandem fusca, aristata;

arista flore brevior; superiore aequilonga; stamine 1; area embryonali $\frac{1}{2}$ caryopsis oblongae aequante.

Hab. in campis de la Serena et Arqueros, Chile (Gay).

31. *FESTUCA LAXIFLORA* Ph. — Linn. XXIX. 98.:

F. perennis, caespitosa, culmos fertiles sterilesque emittens; culmis $1\frac{1}{2}$ -pedalibus, foliis elongatis, 2- $2\frac{1}{4}$ lin. latis, laevibus; supremis caulinis apice fere paniculam attingentibus, 2- $2\frac{1}{2}$ -pollicaribus; vagina brevi, truncata, lacera; panicula 4-5-pollicaris, laxa; ramulis solitariis, ultra medium nudis, inferioribus spiculas c. 4 gerentibus; spiculis 7 lin. longis, oblongis, subsexfloris; floribus distantibus; glumis inaequalibus, inferiore vix 2 lin. longa, fere subulata, superiore ultra 3 longa, trinervia, lineari; palea inferiore $4\frac{1}{2}$ lin. longa, lineari-lanceolata, quinquenervia, aristato-acuminata; superiore parum brevior, in nervis brevissime ciliolata; rhachi vix pubescente, atropureo.

Loco S. Rafaeli dicto peninsulae Tres Montes legit cl. Fonk. — Differt a *F. purpurascens* paleis $4\frac{1}{2}$, nec 3- $3\frac{1}{2}$ lin. longis, panicula pauciflora, ramis erectis, solitariis etc.

32. *FESTUCA SCABRIUSCULA* Ph. l. c.

F. caespitosa, glauca, in omnibus suis partibus asperula; foliis omnibus setaceo-convolutis, fasciculorum sterilium tertiam culmi partem aequantibus, caulinis brevissimis: culmo $1\frac{1}{2}$ -pedali, gracili, superius nudo; panicula contracta, subsecunda, pauciflora; ramis binis, breviusculis; spiculis $4\frac{1}{2}$ lin. longis, 4-5-floris, scabris, glumis late lanceolatis, superiore fere ovata, trinervia, 2 lin. longa; palea inferiore 5-nervia, cuspidata sed non aristata, apice fulva, 3 lin. longa.

In collibus apricis provinciae Valdiviae inveni. — Folia radicalia 6 poll. longa culmeum unicum, vagina quadripollicari et lamina 6-12 lin. longa constans; ligula brevissima biaurita; panicula 3-pollicaris. Differt a *F. glauca* paleis haud aristatis scabritate omnium partium; a *F. compressifolia* Presl vero caule haud repente, ligula brevi, biaurita, neque ovata imbriata, spiculis 4-5-floris neque 8-floris etc.

33. *FESTUCA ROBUSTA* Ph. l. c.

F. caespitosa, culmo erecto, $1\frac{1}{2}$ -3-pedali, foliis convolutis, extus laeviusculis intus pilis brevibus scabris; culmeis subtribus; ligula brevissima, truncata, glabra; panicula pedali stricta; verticillis inferioribus distantibus; ramis subquinis, valde inaequalibus; spiculis 6 lin. longis, oblongo-linearibus, saepe violascentibus, scabris, 6-floris; gluma inferiore carinata, uninervia, superiore tertio majore, trinervia, dorso rotundata; palea inferiore fere 3 lin. longa, 5-nervia, acuminata, mutica; inferiore superiorem aequante; rhachi scabra.

In collibus prope Santiago in rupium fissuris. — Folia radicalia stricta, fere $1\frac{1}{2}$ pedem longa; stamina 3; caryopsis maturam non vidi. — Similis videtur *F. purpurascens* Banks et Sol, sed differt: stolonibus nullis, ligula haud ciliata, brevissima, panicula pedali, stricta, haud divaricata, rhachi scabra sed non pubescente. A *F. procera* H. B. Kth., nimis breviter descripta, panicula haud secunda, ramis subquinis nec geminis, spiculis sexfloris haud novemfloris, aristis nullis satis distincta videtur.

34. *FESTUCA HOOKERIANA* F. Müll. Mss. (in Hook. Fl. Tasm. v. 2. p. 127. t. 165).

Elate, erecta, culmis vaginisque laevibus scaberulisve, foliis breviusculis planis coriaceis utrinque scaberulis, ligula brevi, coriacea, panicula effusa nutante, ramis elongatis, spiculis majusculis 6-8-floris, glumis carina marginibusque ciliatis, inferiore 3-nervi superiore 5-nervi, rachilla pilosa vel barbata, palea inferiore 7-nervi apice aristata vel sub apice biloba breviter aristata carina scaberula, superiore apice bidentata carinis pectinatis.

Hab. in Tasmania (Cheshunt, Archer) et in alpebus in Victoria Australiae.

Est Festucae spadicinae europeae, sed adhuc magis *F. Kinigianae* in Fuegia sat similis. In spec. junioribus stigmata terminalia conspiciuntur, sed in adultis caryopsis obovata, profunde sulcata, fere biloba, stigmatibus sub apice insertis, matura denique

caryopsis fere recta stigmat. terminalibus, Ambigit itaque inter Festucam et Bromum
— Gramen robustum 2—4-pedale.

35. **FESTUCA DISTICHOPHYLLA** Hook. fil. (Fl. Tasman. 2. p. 127.):

Culmis brevibus ramosis rigidis glaberrimis laevibus foliosis, vaginis imbricatis, foliis distichis involutis setaceis strictis, ligula brevissima, panícula racemosa terminali pauciflora, spiculis sessilibus laevibus compressis 8—10-floris, floribus arcte imbricatis, glumis ovatis acuminatis floribus brevioribus, palea inferiore late ovata acuminata striato-nervosa. — *Poa distichophylla* Br. Prodr. 182. — *Uniola distichophylla* Lab. Fl. Nov. Holl. I. p. 21. t. 24. Steud. Synopsis p. 280.

Hab. in Tasmania in ripis, et in Australia extratropicali.

Gramen rigidum, laevissimum, densissime caespitosum. Culmi usque ad $1\frac{1}{2}$ ped. longi, valde ramosi: folia 1—3 poll. longa, rigida; spiculae $\frac{1}{2}$ — $\frac{1}{2}$ poll.

36. **FESTUCA LITTORALIS** Labill. (Fl. Nov. Holl. I. 22. t. 27. Br. Prodr. 178. Hook. fil.

Fl. Antarct. I. p. 99. Fl. Tasmaniae 2 p. 128. — *Poa littoralis* Lab. Fl. Nov. Holl. 1 pag. 22 t. 27. — *Arundo triodioides* Trin. Sp. Gram. 3. t. 351. Steud. Synops. p. 194. — *Schenodorus Billardierianus* Nees Lond. Journ. Bot. 2.p. 419. — *S. littoralis* P. B. Agrost. Hook. fil. Fl. Nov. Zeland. T. I. p. 309.

β. *minor*: panícula brevior, spiculis minoribus. — Hook. Fl. Nov. Zel. I. c.

Hab. in Nova Zelandiā: northern and middle island prope mare (Banks and Soland., Stephenson, Colenso) — in Tasmania copiose, in Australia extratropicali, et in Lord Auckland's island. Var. β. Auckland (Sinclair). Port William (Lyall.)

37. **FESTUCA FOLIOSA** Hook. fil. (Fl. Ant. p. 99. t. 55):

Glaberrima, culmis caespitosis compressis foliosis (in examp. Nov. Zeland.) brevibus, foliis subdistichis planis vel subinvolutis culmo brevioribus longioribusve, ligula membranacea triangulari, panícula nutante effusa multiflora, glumis 4—6-floris acuminatis flosculis approximatis brevioribus, palea inferiore 5-nervi acuminata subsericea v. glaberrima basi barbata. — Hook. fil. Fl. Nova Zeland. p. 308.

Hab. in Nova Zelandiā; middle Island, Port William (Lyall.)

Gramen littorale, subpedalis; culmus brevis, folia coriacea culmo breviora; spiculae $2\frac{1}{2}$ —3 lin. longae.

899b. **CATAPODIUM.**

(Walp. Ann. II. 777.)

1. **CATAPODIUM TUBERCULATUM** Moris Explor. scient. de l'Algérie t. 41. n. 2.

899c. **VULPIA** Gmel.

1. **VULPIA PATENS** Boiss. diagn. XIII. p. 62:

V. annua glabra, culmis tenuibus pumilis basi geniculatis parce foliosis laevibus vaginis angustis, limbo convoluto setaceo flexuoso, ligula brevissima ovata acuta, panícula erecta simplici vel basi ramosa oblonga parva, spiculis rachidi crassiusculae rigidae acute angulatae distiche et angulo recto insidentibus patentibus subsessilibus oblongis 5—7-floris gluma inferiori minima triangulari squamaeforni, superiori lanceolata quadruplo majori flosculi infimi quartam partem aequanti utraque glabra, flosculis glabris linearibus infimis acutis superioribus in mucronem brevem attenuatis.

Hab. in deserto Arabiae petraeae Palaestinae contermino ubi pauca specimina Aprilis 1846 legi.

Culmi vix semipedales, panícula 1— $1\frac{1}{2}$ poll. longa, spiculae cum pedicello brevissimo fere 2 lineas longae, flosculorum mucro vix lineam dimidiam longus. Species spiculis axidi spicae distiche et angulo recto insidentibus brevissime aristatis prope V. cynosuroidem Parlatore = *Festucam delicatulam* Lag. collocanda.

899/914. **BRACHYPODIUM** Palis.1. **BRACHYPODIUM OBTUSIFOLIUM** Boiss. voy. p. 679. t. 180.

Caespitosum, caulib. foliosis h. ramosis, foliis convuluto-setaceis patenti-recurvis obtusissimis, culmis unispiculatis, glumella exteriori in aristam ea fere duplo breviorē abeunte.

Brachypodium obtusifolium Boiss. non Link.

Triticum obtusifolium Boiss. El. n. 199.

Radix caespitosa, cact.

In aridis calcareis et in rupestribus reg. montanae superioris et alpinae, Sierra Tejada, Nevada; alt. 4000—6500'. Fl. Jun. Jul.

NARDURUS Rehb.1. **NARDURUS SALZMANNI** Boiss. voy. p. 667. t. 178b.

Annuus f. setaceo-convolutis, spica simplici filiformi subincurva, spiculis sessilibus minimis unilateralibus 4—5-floris, glumis inaequalibus obtusissimis, flosculis lanceolato-linearibus marg. scariosis obtusis muticis. (Conf. supra p. 1034. *Festuca Salzmanni*.)

Festuca et *Brachypodium Salzmanni* Boiss. in Sched. et litt.

Triticum filiforme Salzm. pl. exsicc. non Poir.

In arenosis reg. calidae et montanae prope Malaga ad pedem montis San Anton. Alt. 1000—3000'. Fl. Ap. Maj.

2. **NARDURUS PERSICUS** Bunge Boiss. et Buhse Pl. Cauc. et Persiae in N. Mem. de la Soc. d. Natur. de Moscou. T. XII. p. 225:

Annuus glaber culmo pumilo, foliis brevibus laevibus lineari-setaceis culmeorum vagina subampliata striata, ligula brevi biariculata, spica laxiuscula, disticha, rachide flexuosa compressa ad angulos scabra, spiculis sessilibus 3—5-floris laxi, glumis lanceolatis acutis inaequalibus superiori triplo longiori. Flosculis tereti-subulatis tenuiter scabridis in aristam eis aequilongam tenuissimam sensim attenuatis.

Inter Dscheddak et Jesn prope Bunegu 6. Apr. 1849, leg. Lehmann.

Plantula 3—5-pollicaris, sesquipollicem longe. Flosculis cum arista 5 lineas longus. Ab aliis speciebus generis flosculis tenuissimis longe aristatis diversissimus.

δ. *arenarius*: spiculis glabriusculis; vaginis villosis, foliis pilosis. — Heuff. l. c.

Hab. in lapidosis montium calcareorum et in arena mobili legionum Illyrico- et Teutonico-banaticarum. Jun. Jul.

7. BROMUS ANATOLICUS Boiss. et Heldr. in pl. Anat. exs. 1816 (Sect. Serrafalcus). — Boiss. diagn. XIII. p. 63.

B. annuus foliis inferiorib. ad vaginas et limbum, superiorib. secus limbum tantum indumento longo patulo mollissimo obsitis, panicula erecta patenti pyramidata ramis capillaribus patulis nutantibus inferioribus elongatis, spiculis oblongo-lanceolatis adpresse velutinis, floribus late ellipticis fructiferis margine subimbricatis, palea inferiori elevatim 9 nervi margine medium versus rotundata superiorem paulo superanti, aristis ad tertiam partem dorsi insertis siccatis recurvato-subpatulis florum superiorum palea longioribus inferiorum brevissimis.

Bromus squarrosus β. *Cyri* Trinius ex Griseb. Gram. Ross.

Hab. in rupestribus collium prope *Tsimboukkan Pamphyliae* (Heldreich).

Species habitu, spicularum forma et magnitudine *B. squarroso* affinis qui differt indumento multo breviori velutino, fasciculis arctius imbricatis brevioribus oblongis, palea exteriori margine latius membranacea angulum obtusum manifestum exhibenti, aristo altius inserta. *Br. arvensis* et *B. patulus* spiculis lanceolatis apice attenuatis paleisque quoque margine obtuse angulatis longius distant.

8. BROMUS MACROCLADUS Boiss. (Sect. Serrafalcus). — Boiss. diagn. XIII. p. 64.

Br. annuus ad limbos et vaginas breviter et patule hirsuto-velutinus, culmo elato, panicula erecta triangulari-pyramidata ramis filiformibus erecto-patulis longis inferioribus 5—7 verticillatis, spiculis oblongo-ellipticis, floribus ellipticis fructiferis margine imbricatis, palea inferiori asperulo-punctata sub 7 nervi rubella margine latiuscule albo membranacea medium versus convexa nec angulata, superiori conspicue breviori, arista paulo supra tertiam partem paleae inferioris inserta tenui recta vel extrorsum subarcuata florum superiorum palea longiori inferiorum brevissima.

Hab. in collibus ad radices meridionales Tmoli inter Terrassa et Birgui in Lydia (Boiss. 1842).

Tripedatis, panicula semipollicem et amplius longa, ramis inferioribus saepe 3 pollices longis, his notis affinis *B. arvensi* qui differt spiculis angustioribus lanceolatis apice attenuatis, paleis paululum abbreviatis margine supra medium obtuse angulatis, arista altius inserta. *Br. patulus* quoque paleis angulatis, inferiori subaequilonga, pa-

nículaque subunilaterali differt. Br. Anaticus denique praeter pubescentiae indolem aristas crassioribus recurvis, spiculis latoribus etc. longius differt.

9. *BROMUS CRINITUS* Boiss. et Holb. in pl. Pers. bor. 1846. (Sect. Eubromus). — Boiss. diagn. XIII. p. 64.

Br. annuus? caespitosus radice fibrosa, culmis pluribus erectis foliosis medioeriter elatis, foliis teneris viridibus vaginisque pube brevissima deflexa sub lente parce oblitis, limbo lineari-lanceolato acuto, ligula ovato-oblonga hirsuta fimbriato-lacera, panicula oblonga contracta ramis capillaribus strictis scabridis spicula pluries longioribus, spiculis minimis ovatis modice compressis subquadrifloris glabris, glumis subaequilongis lanceolatis attenuato-acuminatis flosculum inferiorem aequantibus inferiori 1-superiori 3-nervi, flosculis ellipticis, palea exteriori viridi laevi obsolete 6—7 nervi paululum sub apice brevissime membranaceo subdidentata arista setacea recta ea sextuplo longiori munita, palea interiori aequilonga elliptico-lineari ad 2 nervos scabridula.

Hab. in monte Elbrus prope pagum Passgala.

Culmi 6—9 pollicares, panicula $1\frac{1}{2}$ —2 pollicaris densiuscula, spicula absque aristas $2\frac{1}{2}$ lin. fere longa, flosculi sesquilineam aut paulo amplius, aristae 7—9 lin. longae. Species floribus minutis longe aristatis insignis, nulli aliae generis propius affinis, spiculis compressiusculis sectioni Serrafalco accedens sed numero nervorum glumarum habituque aptius prope Br. tectorum collocanda.

10. *BROMUS SIPYLEUS* Boiss. (Sect. Eubromus). — Boiss. diagn. XIII. p. 65.

Br. perennis, radice fibrosa, foliis lato-linearibus planis flexuosis margine scabris infimis paulo angustioribus omnibus praeter 2—3 superiora ad vaginas deflexim hispidualis ad limbi margines ciliatis, vagina brevissima subtruncata, culmo elato, paniculae flaccidae nutantis abbreviatae ramis valde elongatis nudis, pedunculis scaberrimis spicula brevioribus, spiculis lineari-lanceolatis strictis elongatis 7—9 floris, glumis aequalibus lineari-lanceolatis trinerviis carinatis acutissimis glabris carina scabridis, flosculis lanceolatis, palea exteriori lanceolata lineari sub 7 nervi apice attenuata acuta paululum sub apice arista recta tenui dimidio breviori aucta scabridula, interiori breviori elliptico-lineari ad 2 carinas remote breviter et rigidule denticulato-ciliata.

Hab. in umbrosis Sipyli supra Magnesiam in Lydia ubi legi fine Junii 1842.

Planta 4—5 pedalis, culmo crassiusculo, foliorum intermediorum limbo saepe fere pedali 4 lin. lato, paniculae rami inferiores parte nuda 2—3 pollicares cernui, spiculae sesquipollicares angustae. Species pulchra habitu et characteribus Br. asperi donata qui differt pilis foliorum validioribus longioribus magis asperis, spiculis flosculisque fere triplo minoribus adpresse hirtis, glumis inaequalibus. Br. erectus paniculae erectae ramis brevissimis longius distat.

11. *BROMUS SCLEROPHYLLUS* Boiss. (Sect. Eubromus). — Boiss. diagn. XIII. p. 65.

Br. glaberrimus perennis, radice repenti, caudicibus crassis vaginis vetustis nigris reticulato-fibrosis vaginatis, culmis elatis rigidis erectis parce foliosis, foliis rigidis duris plicato-convolutis subcylindricis subincurvis elevato-plurinerviis albidis subpungentibus, ligula brevissima truncata, panicula brevissima erecta ovata paucispiculata, ramis unispiculatis spicula longioribus strictis inferioribus binis, spicula 7 flora, glumis anguste lanceolatis valde acuminatis aequalibus flosculum infimum subaequantibus, axi pilosula, flosculis subdissitis, palea inferiori lanceolata trinervi adpresse et valde scabrida paulo sub apice acuminato membranaceo arista aequilonga contorto-divaricata aucta, palea superiori elliptico-lineari remote et longiuscule setulis scabrida.

Hab. in monte Tmolo supra Philadelphiam in Lydia ubi legi Jun. 1842.

Culmus sesquipedalis, folia inferiora angusta 4—5 pollices longa, panicula $2\frac{1}{2}$ pollicaris in meo specimine 5—6 spiculata, flosculi 6—7 lin. longi, arista paulo supra basin contorta. Species Br. erecto et Br. tomentello affinis ab utroque radice breviter repenti, foliis duris convolutis-cylindricis distincta, a priori iterum flosculis 3 nec 5—7 nerviis longe aristatis arista divaricata, a posteriori glabritie diversa.

Obs. Br. Persicus Boiss. in Kotschy pl. Pers. bor. 1846 est Br. tomentosus Trinius.

12. BROMUS (FESTUCOIDES) CAPPODOCICUS Boiss. et Bol. (pl. or. exsicc. n. 841. Bull. de la Soc. bot. de France 1857 p. 306).

Caespitosus, perennis. Culmus cylindricus, glaber, laevis, basi geniculatus. Folia fertilia plana, marg. scabra, sterilia angusta, glabra vel pilis raris conspersa. Vaginae tubulosae. Panicula ovalis, nutans, ramis inferioribus geminis v. ternis, divaricatis, 2-5-spiculatis. Spiculae lineari-lanceolatae, 5-10-florae flosculis superioribus sterilibus; glumae inaequales, lanceolatae glabrae, paleas inferiores tertia parte breviores, inferior minor 1-nervia, superior 3-nervia; palea inferior lanceolata, 3-5-nervia, nervis scabris, sub apicem arista ejus longitudine instructa; palea superior bicarinata, integra v. bidentata, carinis scabris v. velutinis. Lodiculae 2, lanceolatae, integrae, glabrae antheris lineari-lanceolatis. Ovarium parte superiore velutinum; styli distincti sub apice ovarii inserti; stigmata sessilia plumosa. Caryopsis paleis tertia parte brevior extus convexa, intus concava, paleis inclusa iisque affixa.

Hab. in collibus Cappadociae usque ad 1500 metr. alt. copiose.

13. BROMUS GBACILLIUMUS Bunge (Rob. Lehmann. in Mém. prés. à l'Acad. de St. Petersb. 1854, p. 527):

Annuus; culmo inferne retrorsum pubescente, foliis molliter pilosis, ligula villosa elongata, paniculae aequalis laxae ramis inferioribus quinis-duodenis elongatis flexuosis erectis scaberrimis simplicibus divisivae, spiculis obovatis vel obovato-rhombeis 4-7-floris, gluma inferiore 1-superiore subtrinervia, flosculis lineari-oblongis invicem haud tegentibus, palea inferiore obovata obscure quinquenervia, arista subterminali recta paleam quadruplo superante, inferiore margine rigide ciliolata truncato-emarginata.

Hab. in deserto Karakan prope Kuk-Kobak, 19. Maj. 1842.

Species singularis ab omnibus Bromi speciebus distincta habitu gracili et spiculis flosculisque parvis, palea nempe inferiore, praeter aristam, sesquilineam tantum longa, tamen ob aristam infraapicalem, ovarium apice hispidum, styliorumque insertionem ad Bromos amandanda.

Descript. compl. l. c. vide.

14. BROMUS MANGO Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 436. tab. 82.

B. robustus, caespitosus, culmis 1-2½-pedalibus, basi fibrillis tectis; foliis infimis 8-12-pollicaribus et ultra, planis, margine denticulatis; ligula rotundata; panicula laxa 6-8-pollicari; ramis erectis, inferne 4-6 verticillatis, apice spiculas 1-6 erectas, ellipticas, 4-8-floras gerentibus; glumis ovato-acutis, inferiore minore, superiore 5-7-nervia floris ¾ aequante; floribus elliptico-oblongis obtusiusculis; paleis subaequalibus, 2¼-3¼ lin. longis, extus adpresse pilosis, inferiore carinato-concava, apice mutica vel mucronata; superioris emarginatae carinis usque ad apicem dense pilosiusculis; ovario pyriformi-rotundato, trilobo, lobis hirtis, antico minori. — Species habitu B. secalino valde similis.

Hab. in Chiloe (Gay).

15. BROMUS STAMINEUS Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 440.

B. caespitosus, perennis, culmo erecto, 2-pedali, superne anguloso; foliis planis latis, 5-8-pollicaribus; ligula brevi, rotundata; vaginis inferioribus pilosis; panicula 8-pollicari, patula; ramis rigidis, non pendulis; spiculis erectis, valde compressis 4-6-floris, lanceolatis, 9-12 lin. longis, viridi-violaceis; glumis acuminatis, subulatis; floribus imbricatis, argute carinatis 5-6 lin. longis; palea inferiore 9-nervia, sub apice brevissime bilobulato aristata; arista 4-5-lineari; palea superiore angustissima, bicuspidata; staminibus 3; antheris linearibus, 2½-3 lin. longis; ovario triangulari, trilobo, lobis posticis truncatis, elongatis, antico tuberculiformi, minimo, longe hispido.

Hab. in Runcagua Chili (Bertero n. 117.)

16. BROMUS TRINII Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 441.

B. annuus, variabilis, caespitosus, culmis ½-3-pedalibus; ligula ovata, dentata foliis vaginisque glabris vel pubescentibus; spiculis 2-6-floris, 6-12 lin. longis, subcompressis, ovatis vel lanceolatis; glumis linearibus, inacuminatis, inferiore 1-, supe-

riore 3-nervia; floribus non imbricatis, dorso convexis; palea inferiore lineari-oblonga, utrinque attenuata, 5-nervia, demum teretiuscula. undique hirta, apice biloba, inter lobos cuspidato-setigeros aristata, arista basi tortili, geniculata, divaricata,

α. *pallidiflora*. Robusta, 2-pedalis et ultra, usque ad apicem nodosa; vaginis foliisque glabris; panicula ampla, effusa, pallida; spiculis 5—6-floris; floribus 5—6½ lin. longis, primum imbricatis, erectis; gluma superiore latiore; antheris linearibus, 1½—2-linearibus.

β. *micranthera*. Ut in antecedente, sed vaginis foliisque hirtis; panicula viridi; antheris brevissimis, ovatis.

γ. *manicata*. Pedalis, basi ramosa, nodis subbasilaribus; panicula laxa, stricte erecta; foliis glabris, angustis; spiculis 4—5-floris, lanceolato-elongatis; floribus angustis, erectis, longe bicuspidatis, hispidis, basi pilis albidis manicatis; gluma superiore angusta; antheris brevissimis, ovatis.

δ. *effusa*. Tripedalis, gracilis, simplex, usque ad apicem nodosa, ad nodos hirta; vaginis foliisque velutinis; panicula laxissima; spiculis 3—4-floris; floribus patulis 4—5 lin. longis, fusco et violaceo tinctis; arista 5—7 lin. longa; antheris ovatis.

ε. *stricta*. Pedalis, gracilis, basi ramosa, ad medium nodosa; foliis angustis vaginisque glabris; panicula stricta, angusta, 2—3-pollicari; spiculis 3—4-floris; floribus sordide olivaceis, sparse hirtis, 3—3½ lin. longis, lobis brevibus, obtusiusculis; arista 3—4 lin. longa.

18. BROMUS COLLINUS Ph. — Linn. XXIX. 101.

Br. caespitosus, perennis, culmo erecto, 1½—2-pedali; foliis planis, glabris egregie ciliatis, 1½ lin. latis; ligula brevissima truncata; panicula 4½ poll. longa, satis contracta; ramis rigidis, erectis, ternis quinisque, 1—3 spiculas gerentibus, spiculis erectis, subquadri-floris, 9 lin. longis, lanceolatis, virescentibus; glumis acuminatis, subulatis, glaberrimis, majore 3 lin. longa; palea inferiore 5-nervia, sub apice brevissime bilobulato aristata, basi pubescente, margine versus apicem sicut arista spinuloso-ciliato, caeterum laevi; nervo medio exterioribusque valde conspicuis, reliquis duobus subobsoletis; arista recta, bilineari; rhachi pubescente.

Prope Santa Rosa in prov. Aconcagua legit cl. Gay. Herb. chil. n. 196. — Differt a *Br. stamineo* statura minore, foliis angustis, vaginis glabris, paleis quinquenerviis, nervis 3 valde prominentibus, nec novemnerviis; nervis omnibus parum conspicuis, rhachide haud glabra.

Obs. *Bromus stamineus* Desv. est famosus ille *Bromus catharticus* Molinae, quem ipse Guilno vocat, quem vero semper Lanco appellari audivi, jam a Feuilleo nomine *Gramen bromoides catharticum* descriptus et figuratus, remedium domesticum frequentissime inter chilenses usitatum, quod monere utile duxi, cum de ejus usu et nomini-bus vernaculis apud cl. Gay altum silentium sit! — Caeterum haec species variat spiculis glaberrimis et aristis fere omnino obsoletis. In provinciis centralibus frequentis-sima est.

19. **BROMUS VALDIVIANUS** Ph. l. c.

Br. perennis, caespitosus; culmis erectis, $1\frac{1}{2}$ -pedalibus, superius nudis; foliis radicalibus angustis, pilosis, 6 poll. longis, 1 lin. latis; caulinis latioribus, vaginisque valde sulcatis, glabris; ligula foliorum superiorum triangulari, lacera, panicula $3\frac{1}{2}$ pollicari, stricta, spiculis 8—15 composita; spiculis lanceolatis, 8 lin. longis, 4—5-floris, scaberulis, viridibus; glumis lanceolatis, nervosis, superiore $3\frac{1}{2}$ lin. longa; floribus acute carinatis; palea inferiore 5 lin. longa, sub apice brevissime bilobulato aristata, novemnervia, nervis parum conspicuis; arista bilineari; rhachi scaberula.

In collibus apricis prov. Valdiviae frequens. — Differt a Br. stamineo foliis angustis, radicalibus pilosis, vaginis contra glaberrimis; panicula longe minore, spiculis omnino scabris; a Br. collino mihi vero paleis novemnerviis, scabris etc.

20. **BROMUS FONKI** Ph. l. c.

Br. perennis, culmo erecto, pedali, apice nudo, paucifloro; foliis angustis, pubescentibus; radicalibus $3\frac{1}{2}$ —4 poll. longis, vix 1 lin. latis; culmeis subtribus, ultimo $1\frac{1}{2}$ poll. longo; ligulis superioribus oblongis, lacris; panicula stricta, contracta, ramis geminis vel solitariis, subuni-floris; spiculis circa octo, 6—7 lin. longis, versus extremitatem dilatatis, dense velutino-sericeis, 3—4-floris; glumis ovatis, acutis, inferiore quinque-nervia, superiore septemnervia, paleis fere duplo longiore?; palea inferiore 4 lin. longa, subenervia, integra, apice in aristam rectam, vix dimidiam paleam aequantem terminata; palea superiore inferiorem aequante.

In insula Lemuy, locis cultis invenit cl. Dr. Fonk.

Differt a Br. picto Hook. fil. spiculis modo 6—7 lin. longis, nec pollicaribus, numerosioribus, paleis omnino velutino-sericeis etc.

902. **UNIOLA** L.

(Knth. en. I. 428. suppl. 346.)

lc. add.

UNIOLA STRICTA Torr.

Torrey, bot. of the explor. of the Red River of Louisiana (1852) p. 301. tab. XX.

906. **CHUSQUEA** Knth.

(Knth. en. I. 425. suppl. 350.)

1. **CHUSQUEA BREVIGLUMIS** Ph. — Linn. XXIX. 103.

Ch. glaberrima; foliis floralibus lanceolato-linearibus, 3 poll. longis, 3 lin. latis, basi cuneatis, nervis principalibus 5; ligula brevi, truncata, glaberrima; spiculis 4 lin. longis, violascentibus; gluma inferiore obovata, brevissima; superiore ovata, acuminata, quartam vel ad summum tertiam partem flosculi sterilis adjacentis aequante; palea inferiore florum sterilium longe cuspidata, oblonga, trinervia, nervis parum prominentibus.

In Andibus dep. Chillan legit orn. Germain. Culmi secundum Germain orgyales, erecti, haud scandentes, apice ramosi.

Differt a Ch. valdiviensi Desv. glabritie et praesertim defectu pilorum ad os vaginarum, foliis angustioribus, basi cuneatis; gluma infima brevissima, vix $\frac{1}{3}$ lin. longa spiculis vero majoribus. Cum Ch. Quila, cui glumae aristatae, spiculam subaequantur sunt, nullo modo confundi potest.

2. CHUSQUEA ANDINA Ph. l. c.

Ch. erecta, humilis, vix bipedalis; ramis fasciculatis, densissime foliosis; foliis coriaceis, 13 lin. longis, 2—2½ lin. latis, 5-nerviis, nervo mediano valde prominente; ligula ovata; pedunculo communi dense pubescente, fere villosa; spiculis glaberrimis, nitidis, plerumque violaceis; glumis late ovatis, subaequalibus, quartam spiculae partem aequantibus; paleis floris hermaphroditi septemnerviis, apice acuminatis, nervis duobus lateralibus in apicem continuatis neque antea evanidis.

In Andibus depart. Chillan ad limitem nivis perpetuae occurrit.

Convenit cum *Ch. Coleu* nervo mediano foliorum valde prominulo, sed forma folii longe acuminata valde discrepat et potius ut in *Ch. Cumingii* est; paleae omnes apice angustiores magisque cuspidatae sunt, quam in *Ch. Coleu*; a qua praeterea statura humili primo adspectu differt.

3. CHUSQUEA VALDIVIENSIS Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 446.

Ch. elata, culmis floriferis divaricatis, 6—15-pollicaribus, compresso-sulcatis, polyphyllis; foliorum limbo herbaceo, lanceolato, acuto, 3—4 pollices longo, 4—7 lin. lato, superne viridi et glabro, subtus glaucescente, pubescente pilisque inperso, nervis primariis 7—9 intermedio prominulo, venulisque transversis pellucidis praedito; ligula brevissima, truncata; panicula patula, laxa, 4—6-pollicari; ramis subdistichis, oblique divergentibus, inferioribus 1½—2½ pollices longis; spiculis secus ramos fasciculato-congestis, patulis pendulisve, 3 lin. longis; glumis cuspidatis; inferiore 1-nervia, ½ spiculae, superiore 3-nerviae ½ spiculae attingente; floribus sterilibus glumas superantibus, superiore 3—5-nervia spicula ¼ minore; flore fertili pubescente.

Valde affinis est *C. scandenti* Knth. sed differt glumis cuspidatis ¼ vel ½ spiculae longitudine, flosculo hermaphrodito pilis brevibus et adpressis hirsuto et nervis pellucidis inter nervos secundarios foliorum.

4. CHUSQUEA CUMINGII Esenbeck ex Rupr. Bambus. Monogr. p. 32. Steud. Synops. p. 336. n. 5. — Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 448. tab. 83. f. 1.

5. CHUSQUEA CULEOU Em. Desv. Gram. chil. t. VI. p. 450.

C. erecta, 15—20-pedalis et ultra, culmis terminalibus robustis; ramis erectis, 3—7-pollicaribus, densissime fasciculatis, polyphyllis; foliorum limbo valde coriaceo, lineari-elliptico, vix apice attenuato, mucronato, 1—3 poll. longo, 2—3 lin. lato, nervis primariis 5, lateralibus obsoletis, medio valde prominulo, venulisque transversis pellucidis praedito; ligula ovato-rotundata; panicula 1—1½-pollicari, stricta spiciformi-contracta, 1-laterali; spiculis 2½—3 lin. longis, obtusis; glumis 1-nerviis, spicula ¼—½ minoribus; floris hermaphroditi palea inferiori 7-nervia, tenuissime pubescente, in apice obtusiusculo mucronata.

Hab. prope Valdivia, in sylvis humidis vulgaris (Gay).

Species vicina est *Ch. Cumingii*, sed differt forma foliorum, quae magis coriacea, ad basin numquam attenuata, nervis pellucidis praedita, forma denique spicularum et statura peculiari.

Ad 906. **CHLOOTHAMNUS** Buse.

(Buse in pl. Jungh. III. 386.)

Paniculae parvae paucirameae fere omnium ramorum sunt termini. Spiculae pedicellatae lanceolatae, subquinqueflorae, florib. 4 inferioribus ad glumellam inferam redactis. Glumae adhuc distinguendae, parvae, acutae. Glumellae inferae superiora versus sensim fiunt majores, omnes coriaceae. Glumella supera tantum in fl. supremo, unice absoluto. Lodiculae 3 pentagonales, marginib. conduplicatis ap. longe ciliatis. Stam. 6. Stylus subnullus, stigmata 3 germini insident, lagenaeformi. Caryopsis....

1. CHLOOTHAMNUS CHILIANTHIUS Büse. — Büse l. c. p. 387.

Gramen excelsum, perelegans, habitu Chusquaeis non absimile, at sui generis, hexandrum, tristigmaticum.

Hab. ins. Sumatrae, in prov. Angkolae super. silvis alt. 1—3000' (Jungh.).

Rami mihi prostant 7 pedales etc.

909. **BAMBUSA** Schreb.

(Walp. Ann. III. 781.)

1. BAMBUSA NIGRO-CILIATA Büse. — Büse in pl. Jungh. III. p. 389.

Spiculis anguste cylindricis, saepe curvatis; glumella infera in inferioribus ovata acuta, in superioribus perangusta; glumella supera iidem sensim elongata; ambabus rigide nigro-aut violaceo-ciliatis; stylo simplici; f. b. rotundatis, pedicello brevi, coriac. supra glabris, subt. pubescentib., nervis mediocriter conspicuis, margine asperrimis; f. novellis anguste lanceolatis, b. angustatis. Ut videtur, Bambusa Betung. Hassk. Tijdschr. v. Nat. Gesch. IX. p. 126.

Hab. ins. Javae pr. Tjiberem (Jungh.).

Foliis maxime accedit ad Schizostachyum Blumii Nees. Variat β . f. *glabrescentibus*.

Hab. ins. Javae pr. Tjiberem, cum specie ipsa. (Jungh. non Zoll.)

909₁. **ISCHUROCHLOA** Büse.

(Büse in pl. Jungh. III. p. 389.)

Paniculae pauperes aut glomeruli. Spiculae depressae, multiflorae; fl. deniq. distichis, supremis tabescentib.; articulis rhacheos longis, demum secedentib., spiculis contrarie compressis. Lodiculae 3. Stamina 6. Stylus perbrevis. Stigmata 2 evoluta, longiuscula 1 vel altero hebetato. Ovarium globoso-pyriforme. Caryopsis

Genus proprium in vicinia generis Bambusae locandum, Arthrostylidium quodammodo referens inter Hexandra.

1. ISCHUROCHLOA SPINOSA Büse (Bamb. Kunth Agr. 431. 4). — Büse in pl. Jungh. III. p. 390.

912. LOLIUM L.

(Walp. Ann. III. 782.)

1. LOLIUM PERSICUM Boiss. et Hob. in pl. Pers. bor. 1846. — Boiss. diagn. XIII. p. 66.

L. annuum vel bienne, radice fibrosa culmos floriferos tantum agentis, culmis tenuibus erectis, foliis viridibus teneris multinerviis limbo stricto angustissime lanceolato-lineari, ligula rufescenti ad marginulum truncatum fere obsoletum reducta, spica tenuissima remotiuscule 5—7 spiculata, spiculis strictis minimis subtrifloris, gluma elliptico-lanceolata obtusa dorso quinquenervi anguste membranacea flosculus tertia parte breviori, palea inferiori oblongo-lanceolata viridi subcoriacea dorso subcarinata acuta in aristam rectam tennem ea fere duplo longiorem abeunti, inferiori aequilonga subaequilata acutissima apice subbifida ad carinas scabrida.

Hab. in uliginosis montis Elbrus prope Derhend Kotschy n. 278.

Culmi 9—10-pollicares tenuissimi, spicae lineares 1—1½ pollicares, spiculae absque aristis vix 3 lineas longae, aristae fere 5 lineas longae. — Prope *L. multiflorum* et *L. tenue* auct. = *rigidum* Gaud. collocandum, ab utroque spiculis multo minoribus paucifloris, flosculis magis coriaceis longe aristatis diversissima. *L. arvense* culmo et rachide multo crassioribus, spiculis multifloris, flosculis brevibus turgidis muticis vel breviter aristatis longe quoque distat. Habitus Narduri.

2. LOLIUM LEPTUROIDES Boiss. diagn. XIII. p. 67.

L. bienne vel annuum culmis humilibus basi foliosis cito in spicas crassas cylindricas incurvas abeuntibus, foliis late lineari-lanceolatis multinerviis, ligula brevi marginiformi, rachide crassissima dextrorsum sinistrorsumque alternatim et profunde excavata spiculasque excipienti marginibus latis rotundatis, gluma late lineari obtusa coriacea multinervi flosculos superanti rachidis excavationes exacte claudenti, spiculis excisuris rachidis inclusis a dorso valde compressis subquinquefloris, palea inferiori coriacea elliptica obtusa glabra mutica interiori aequilonga aequilataque carinis scabrida utraque achenio arcte adhaerenti.

Rottbolla loliacea Bory et Chaub. Fl. Pelop. pl. 3. f. 2.

Hab. in Peloponneso circa Modon.

Planta vix semipedalis, folia basi 2 lineas et amplius lata, spica 3—4 pollices lato diametro 2 lineas fere lata, gluma saepe 6—7 lin. longa, flosculi 2 lin. circ. longi. Species insignis habitu omnino Lepturi a quo spiculis multifloris distat et omni jure in genere *Lolio* juxta *L. tenue* auct. = *rigidum* Gaud. collocanda a quo spica crassa incurva, rachide multo crassiori profundiusque excisa, gluma spiculas superanti nec eis subbreviori differt.

3. LOLIUM GLUMOSUM Plan. (fl. gallic. 409):

Culmi tenues glabri, folia angusta, spiculae subcylindricae gluma dimidio breviores, 3—5 florum muticae. An potius forma maera mutica speciei alicujus *Lolii*? Lge. et Willk. Prodr. fl. hisp. I. p. 114.

Hab. in Gallecia Hispaniae.

4. **LOLIUM PERENNE** L. — Monstrositates varias descripsit Eug. Fournier. Bull. de la Soc. bot. de France 1858 p. 85.

913. **TRITICUM** Linn.

(Walp. Ann. III. 782.)

1. **TRITICUM (AGROPYRUM) CURVIFOLIUM** Lge. (pag. I. p. 55):

Elatum (2—2½-pedale) rigidum, folia longissima, arcuato-reflexa, marginibus involutis anguste subcylindrica, apice subulato-pungentia, glauca, pagina superiore scabra, secus nervos pilis longioribus inter eosdem vero pube brevissima adpressa, ad marginem subinde glandulis minutissimis vestita; ligula brevis, cum duabus auriculis oppositifoliis hyalinis setaceis; spica erecta, spithamea, rachis tenax, margine scabro; spiculae distichae, subdistantes (inferioribus internodium aequantibus, superioribus dimidium internodii proximi attingentibus), 5—7-florae, lanceolatae, valde compressae, apice arcuato-reflexae; glumae subaequales, spiculae dimidium attingentes, nervo valido carinatae, 7-nerviae (nervis medio proximis ad apicem exeuntibus), obtusissimae nec mucronatae, superne margine membranaceo lato cinctae; palea inferior apice rotundata obtusissima, 5-nervia nervo dorsali carinata, margine late membranaceo, glandulis minimis stipitatis ciliato et versus apicem quasi denticulato, palea superior dense ciliata. — Lge. et Willk. Prodr. fl. hisp. I. p. 109.

Hab. in collibus gypsaceis subsalsis ad Cienpo-Zuelos Hispaniae (Lge.).

Habitu maxime accedit ad *Triticum scirpeum* Guss. (e speciminibus siculis in herb. Schouwii), sed foliis longissime curvato-deflexis jam in statu juv. involuto-pungentibus, spiculis compressis fere ancipitibus, gluma inferiore uninervia, palea inf. late membranaceo-marginata et margine glanduloso-ciliata etc. videtur differre.

2. **TRITICUM (AGROPYRUM) PANORMITANUM** Parl. — Steud. Synops. p. 344. — *a. hispanicum* Boiss. (Voy. II. 680. t. 181).

Var. glumas habet 5-nervias in aristam 3—5" l. abeuntes et paleas inferiores aristae suae aequilonges. Lge. et Willk. Prodr. fl. hisp. I. p. 110.

Hab. in umbrosis humidis regionis mont. Hispaniae australis passim.

3. **TRITICUM BAEOTICUM** Boiss. diagn. XIII. p. 69.

Tr. annuum, culmis erectis gracilibus, foliis breviter puberulis, culmeorum limbo vagina multo breviori, fasciculo pilorum ligulae locum tenenti, spica terminali densa lineari angusta a latere vix compressa, rachide fragili longe et dense albo-pilosa, spiculis bifloris flore superiori sterili mutico, glumis bicarinatis scabridis flosculo subbrevioribus apice bidentatis dentibus rectis brevibus acutis triangularibus inaequalibus, flosculi fertilis palea inferiori apice in aristam rectam ea multoties breviorem abeunti ad aristae insertionem margine 2 denticulis rectis valde scabridis aucta.

Hab. in planitie Baeotica (Spruner).

Spicae absque aristis sesquipollicares 1½—2 lineas tantum latae, aristae super. bipollicares. Tritico monococco valde affine sed spica fere dimidio angustior obsolete a latere compressa nec valde compressa distichaque, spiculae dimidio minores, axis valde, nec obsolete albo-hirsuta, glumae glabrae scabridae nec superne hispidulae.

Obs. I. *Aegilops macrura* Jaub. et Sp. Illustr. pl. Or. tab. 315 est *Aegilops Aucheri* Boiss. diagn. n. V. jam anno 1844 edita.

Obs. II. *Aegilops loliacea* Jaub. et Spach tab. 317 est *Aegilops mutica* Boiss. diagn. V.

4. **TRITICUM SCABRUM** Br. (Prodr. 178). Hook. fil. fl. Novae Zeland. p. 311. A. Rich. Flor. — *T. squarrosum* Banks et Sol. Mss.; Hook. f. Lond. Journ. bot. v. 3 p. 417. — *Festuca scabra* Labill. Fl. Nov. Holl. v. 1. p. 22. t. 26. — *Festuca Browniana* Steud. Synops. p. 304. — *Vulpia scabra* Nees in Pl. Preiss.?

Hab. in Nova Zelandia: Northern et Middle Island, locis aridis saepe prope mare; (Banks et Sol.).

5. TRITICUM MULTIFLORUM Banks et Sol. sec. Hook. fil. (Fl. Nova Zeland. p. 311):

Erectum, culmis gracilibus vaginisque glabris, foliis planis superne scaberulis, spica elongata, spiculis laevibus appressis 6—16-floris, glumis inaequalibus lanceolatis obtusis acuminatisve nervosis flosculo $\frac{1}{3}$ — $\frac{2}{3}$ brevioribus, palea inferiore inferne nervi superne nervosa obtusa apiculata v. in aristam brevem scabram rectam angustata, superiore obtusa. — *T. scabrum* A. Cunn. Herb. non Br. *T. repens* A. Rich. Flor.?

Hab. in Nova Zelandia: Northern Island, Bay of Islands, Auckland, East Coast etc. (Banks et Sol. etc.)

T. repenti, in Europa vulgari, valde affinis, et speciei ex Tibet (*T. semicostato*) identicum. — Culmi 1—2-pedales; folia plana 4—8 poll. longa superne scabra. Spica palmaris e spiculis 6—12 composita; spiculae $\frac{1}{4}$ — $\frac{3}{4}$ poll. longae.

6. TRITICUM RIGIDUM Schrad. germ. 1. 392. — Steud. Syn. p. 343.

β. *banaticum* Heuff. (Verhandl. d. zool.-bot. Gesellsch. zu Wien 1858 p. 235): rachi foliisque culmi latoribus glaberrimis, vaginis ore barbatis.

Hab. in arena mobili legionum Illyrico- et Teutonico- banaticarum. Mai. Jun.

7. TRITICUM HORDEACEUM Coss. et Dur. (Bulletin de la Soc. botan. de France 1855 p. 312.)

Planta perennis, caespitosa; foliis rigidulis; spica oblonga, densa, disticha, rachi demum fragili, marginibus piloso-barbata, internodiis abbreviatis, spiculis 3—5-floris, florum inferioribus 2-aristatis, superioribus 13 tabescentibus muticis; glumis oblongis, apice utrinque truncato aristatis concavis, dorso inter nervos valde prominentes planiusculis, nervis hirsuto-pilosis, pilis haud fasciculato-penicillatis; glumella inferiore basi vix ventricosa, superne carinata, aristata, arista glumellam subaequante vel brevior. — Majo.

Hab. in pascuis et herbidis regionis montanae Algeriae usque ad 2000 metra.

Est *T. villosa* affine.

8. TRITICUM (AGROPYRUM) DIVARICATUM Boiss. et Balansa (Pl. orient. exsicc. n. 840. Bull. de la Soc. bot. de France 1857 p. 307).

Radix subcaespitosa. Culmi cylindrici glabri. Folia etiam inferiora rite evoluta, plana, lanceolata, utrinque molliter pubescentia. Ligula truncata fere nulla. Vaginae laeves. Spiculae 4—5-florae, flosculus superioribus sterilibus. Rachis glabra, maturitate sat fragilis. Glumae longitudine flosc. inferiores subaequantes, glabrae, oblongae, acutae, in aristam attenuatae, inferior 5-nervia superiore 7-nervia subbrevior. Palea inferior oblongo-lanceolata, glabra vel dorso obsolete scabra apice arista divaricata fere duplo longiore instructa. Palea superior inferiorem subaequans, bicarinata, carinis scabris. Lodiculae lanceolatae, apicem versus pilis raris pubescentes. Ovarium villosum, sat longe stipitatum. Caryopsis oblongo-lanceolata, canaliculata, glabra, paleis inclusa iisque adfixa.

Hab. in regione subalpina Karamas-Dagh et Dede-Dagh (Cappadociae) — ad 1600 metr. alt.

T. elymoidi Hochst. sat affine, glumis vulgo aristatis, foliis molliter pubescentibus, et paleis inferioribus dorso laevibus diversum.

9. TRITICUM (AGROPYRUM) TAURI Boiss. et Balansa (Pl. or. exsicc. n. 826. Bull. de la Soc. botan. de France 1857 p. 307. — *Brachypodium ramosum* RS. var. Boiss. in Kotschy pl. Cilic. exsicc. n. 233 b.).

Planta omnibus partibus glabra. Rhizoma caespitosum. Culmi steriles fertilibus tertia parte breviores, nodis saltem superioribus glabris, fertiles cylindrici glabri. Folia lineari-setacea plus minus involuta, laevia et extus glabra, superne pubescenti-velutina. Ligula perbrevis, truncata. Vaginae laeves, glabrae, Spiculae 4—7-florae, spicam laxam formantes. Rachis glabrescens. Glumae oblongo-lanceolatae, obtusae, marg. scariosae, 5-nerviae, subinaequales, $\frac{2}{3}$ partem palearum aequantes. Palea inferior oblongo-lanceolata, mutica, 3—5-nervia; palea superior bicarinata, integra vel

bifida, $\frac{3}{4}$ partem paleae inf. aequans, carinis subglabris. Lodiculae 2 oblongo-lineares, acutae, subciliatae. Ovarium apice villosum, basi subito attenuatum; styli distincti, paullulum sub apice ovarii inserti; stigmata plumosa.

Hab. in regione alpina et subalpium montis Tauri 1700 metr. alt.

T. Elymogenes (T. junceum — Elymus arenarius) Arndt. Regensb. Fl. 1859 n. 14.

T. strictum Dethard. consp. plant. megap. p. 11. Koch Synops. 2. p. 952, apud Steudel omissum.

10. TRITICUM REPENS var. MAGELLANICUM Em. Desv. Gram. chil. in Gay Fl. chil. t. VI. p. 452.

T. rhizomate repente, culmis $1\frac{1}{2}$ —3-pedalibus; ligula brevissima, denticulata; foliis planis vel convolutis, intus punctulato-scabris; spica 3—6-pollicari, virente; spiculis erectis, laxiusculis, non adpressis, oblongo-ellipticis, compressis, 6—8 lin. longis, 3—4-floris; glumis subaequalibus. spiculam dimidiam aequantibus vel superantibus, oblongo-ellipticis, convexis, 4—6-nerviis, muticis vel mucronatis, inaequaliterilibus, apice eroso-denticulatis, extus pubescenti-scabris; palea inferiore 5-nervia, oblongo-elliptica, mutica vel subaristata, saepius emarginulata, extus dense pubescenti-scabra.

T. repens L. sp. 128. var. pungens Brongn. in Duperr. Voy. Bot. p. 56.

T. glaucum d'Urv. Fl. des Malouines p. 31.

Habitat in freto magellanico, Port Gallant (Le Guillon), puerta del Hambre (Hombron):

913/b. **AGROPYRUM** Palis.

(Walp. Ann. III. 782.)

1. AGROPYRUM (TRITICUM) ROUXII Gren. et Duval. — Gren. in Flor. Massiliensi advena 1859 p. 23.

Spica continua elongata (1 dec. longa), gracili b. saepe glumis sterilibus aucta, rhachi glabra; spiculis trifloris; glumis glabris subaequalibus, flosculo infimo vix brevioribus, anguste lanceolatis, acuminato-aristatis, uninerviis aut obscure trinerviis, carina aspera, b. minime contiguis, sed utrinque valde distantibus, sicut in Elymis; flosculis glabris, approximatis, duobus inferioribus congestis, subsessilibus, superiore stipitato; stipite glabro, 2 mill. longo; valvula inferiore lanceolata, subnervia aut obscure trinervia, aristata, arista dimidiam vel tertiam valvulae partem vix excedente; f. angustis convolutis striatis culmo multo brevioribus, glabris; ligula brevissima; vaginis inferioribus pubescentibus, superioribus sulcatis, glabris; culmo erecto, geniculato, glabro, superne tenuiter sulcato, radice fibrosa.

A Mr. Roux detecta pr. Massilia.

2. AGROPYRUM CRISTATUM R. et Sch. β *puberulum* Boiss. — Boiss. diagn. XIII. p. 67.

Vagina et folia pilis patulis vel dellexis velutina, spicae angustae spiculis glabris vel velutinis.

Triticum puberulum Boiss. et Hohl. in Kotsch. pl. Pers. bor. 1846.

Hab. ad radices montis Demawend prope Ask. Kotsch. n. 374.

Ex comparatione polymorphi Ag. cristati cui A. pectinatum quoque referendum comperi nostram plantam ab eo specificae non differre et praesertim habitu et spicis Agr. cristato var. β . Florae Altaicae optime congruere.

3. AGROPYRUM HORDEACEUM Boiss. diagn. XIII. p. 67.

A. annuum culmis nanis foliosis, foliis inferioribus anguste linearibus brevissime tomentello-hirtulis superiorum glabrescentium vagina inflata elongata valde nervosa limbo dilatato ad margines latius albo-nervoso spicam aequanti vel superanti, spica

densa ovato-oblonga obsolete disticha vagina summa basi involucreta, spiculis 4—5 floris, glumis angustissime lanceolato-linearibus carinatis ad margines praesertim hirsutis longe attenuato-subulatis flosculos subsuperantib. aequilongis nervo carinali absque lente vix distincto, palea inferiori trinervi a basi lanceolata parce et longe hirsuta longe setaceo-attenuata, palea superiori breviori anguste lineari-lanceolata attenuato-acuminata longe bidentata ad carinas scabrida.

Hab. in prov. Aderbidjan Persiae Aucher n. 5422.

Culmi 1—2 pollicares, spicae pollicem aut paulo amplius longae 6—8 lineas latae, glumae 9—11 lineas longae basi lineam dimidiam latae. Species pulchra ex affinitate Tr. Orientalis spiculis longis longe setaceo-acuminatis insignis facie Heteranthelium piliferum referens.

4. AGROPYRUM LASIANTHUM Boiss. diagn. XIII. p. 68.

A. annuum, culmis pumilis foliosis, foliis inferioribus sub lente hirtulis caeteris glabrescentibus, vaginis superioribus subinflatis, limbo oblongo-lineari abbreviato, spicis densis ovatis obsolete distichis e vagina summa remotiusculis, spiculis 4—5 floris, glumis lanceolato-linearibus aequilongis a basi anguste lanceolata longe et patule hirsuta setaceo-attenuatis flosculos subsuperantibus trinerviis carinatis nervo carinali vix absque lente distincto, palea inferiori e basi oblonga dense et longe albo-hirsuta subulato-attenuata, palea superiori breviori lanceolata acuta tenuiter et longe bidentata ad carinas scabrida.

Tr. orientale var. lanuginosum Griseb. Gram. Ross.

Hab. in Campis Caspiis (Fisch.) in Songaria (Turez) sub nomine Tr. orientalis acceptum.

Planta 3—4 pollicaris, spica 8—9 lineas longa 6—7 lata; glumae circ. 5 lin. longae. Praecedenti characteribus affinis differt foliorum limbo abbreviato, spica breviori minori, glumis flosculisque multo brevioribus densius et longius hirsutis abruptius et a medio nec a basi et longissime attenuatis. Ag. Orientale spicularum longitudine magis affine differt spica eximie et regularius disticha, glumis breviter et parcius hirsutis flosculis subbrevioribus et nervo dorsali crasso oculo nudo statim perspicuo donatis, flosculis breviter hirsutis in mucronem eis brevioris nec longioris attenuatis.

5. AGROPYRUM KOTSCHYANUM Boiss. et Hoh. in Kotsch. pl. Pers. bor. 1846. — Boiss. diagn. XIII. p. 69.

A. annuum glabrum glaucescens, culmis inferne geniculatis, vaginis foliorum superiorum subdilatis limbo abbreviato-oblongo lanceolato, spica e vagina superiori longiuscule remota densiuscula ovata imbricata, spiculis 1—3 floris linearibus, glumis coriaceis anguste linearibus acutis ad nervum carinalem crassum scabridis flosculos non aequantibus aequilongis, palea superiori anguste lineari-lanceolata acuta dorso parce scabridula basi tereti superne carinata, superiori breviori lanceolata acuta bidentata ad carinas scabrida.

Hab. in Persia (Aucher n. 2970), ad Teheran (Kotsch. n. 12).

Culmi 6—8 pollicares, spicae pollicares 8—9 lineas latae, spiculae fere 5 lineas longae. Valde affine A. squarrosus Link pro ejus varietate primum habui. A squarrosus tamen nunc me iudice specificè differre videtur spicis spiculisque paulo minoribus, nervo glumarum carinali crassiori magis prominulo, flosculis duobus superioribus arista setacea plus minus elongata terminatis.

6. AGROPYRUM PANORMITANUM Parl. var. Hispanica Boiss. voy. p. 650. tab. 181.

Glumae 5-nerviae in aristam 3—5 lineas longam abeuntes, glumella interior aristam suam subaequans, interior productione nervorum marginalium biaristulata aristis apicem superantibus.

In umbrosis humidis regionis montanae superioris, Sierra Nevada infra San Geronimo secus fluvium Monachil. — Alt. 4500'. Fl. aest.

Cfr. supra Triticum Pan.

915. **ELYMUS** Linn.

(Walp. Ann. I. 948.)

1. **ELYMUS DELILEANUS** Sch. Steud. Synops. p. 348. *E. aegyptius* Spr., *E. rachitrichus* Hochst. et Steud. Syn. p. 350. *Crithopsis rachitricha* Jaub. et Sp. III. pl. orient. IV. t. 321 sec. I. Gay. Bull. de la Soc. bot. de France 1858 p. 317.

Hab. in Aegypto et ad port Juvenal Galliae.

2. **ELYMUS CAPPADOCICUS** Boiss. et Balansa (pl. orient. exicc. n. 843. — Bull. de la Soc. bot. de France 1857 p. 308.)

Omnibus partibus glaber, perennis. Culmi cylindrici, 50 centimetr. alti. Folia linearia, plus minus involuta, sensim attenuata, 1—3 inf. squamaeformia. Spica linearis, spicula solitaria terminata. Spiculae ceterae genuinae, sessiles 1—2-florae rudimento flosculi secundi v. tertii. Glumae lineari-setaceae, scabrae, flosculos aequantes v. superantes, mediae approximatae, laterales 2, subremotae. Palea inferior in apicem brevem attenuata 3—5-nervia, nervis basi obsoleteioribus; palea superior bicarinata, carinis superne ciliolatis, attenuata superiore subbrevior. Lodiculae 2 membranaceae, oblongo-lanceolatae, integrae, glabrae. Antherae lanceolatae. Ovarium apice inflatum basi attenuatum, media superiore parte villosum; stigmata 2 sessilia plumosa, basi distincta, sub apice ovarii inserta.

3. **ELYMUS CHONOTICUS** Ph. — Linn. XXIX. 104.

E. culmo robusto, tripedali; foliis planis, 5 lin. latis; ligula brevi; spica erecta, 5—6-pollicari; articulis basalibus rhachidis 6 lin. longis, altero latere planis, altero convexis; spiculis 8 lin. longis, 5-floris; glumis spicula brevioribus, 5-nerviis, in aristam glumae aequalem sensim attenuatis; palea inferiore fere a basi quinquenervia, apice biloba; arista ejus 11 lin. longa, paleam bis aequante.

Ad S. Rafael et Portum Americanum archipelagi Chonos invenit. orn. Dr. Fr. Fonk. — Differt ab *E. antarctico* et agropyroidi paleis longe aristatis; ab *Andino* spiculis 5-floris, glumis 5-nerviis, longius aristatis, a Gayano arista longa glumarum et plearum.

4. **ELYMUS GAYANUS** Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 467.

E. secpedalis, culmo valido; foliis planis, pedibus et ultra, 3—6-lin. latis, subtus glaucis et marginibus scabris, supra breviter pilosis; ligula rotundata; spica 6-pollicari, sat crassa, viridi-violacea; racheos articulis tereti-compressis, sulcatis, apice horizontaliter truncatis; spiculis ternis, 6—7 lin. longis, 4—5-floris; floribus 3—4-fertilibus; glumis spicula brevioribus, lanceolatis, acuminato-aristatis, arista brevi, 3-sub-5-nerviis; floris inferioris palea inferiore 4½ lin. longa, tota longitudine 5-nervia, glabra, oblonga, in apice vix conspicue scarioso 2-denticulata, nervis 3 mediis in aristam 6—7-linealem confluentibus, superiore aequilonga, apice attenuato-truncata; squamulis basi carnosius lobulo maximo auctis.

Hab. ad Valdivia. Chile (Gay).

916. **GYMNOSTICHUM** Schreb.

(Endl. Gen. pl. n. 916.)

1. **GYMNOSTICHUM GRACILE** Hook. fl. (Fl. Novae Zeland. p. 312, tab. 70.)

Culmis gracilib, vaginisque laevib., foliis planis angustis elongatis superne asperulis, spica elongata subflexuosa gracili, spiculis 20—40 distichis sessilib., glumis setiformib. v. nullis. flosculis 2—3 hispidulis inferiore breviter secundo longe pedicellato plerumque pedicello tertio accedente, palea inferiore 5-nervi (lateralibus obscuris) in aristam rectam rigidam palea breviorum angustata.

Hab. in Nova Zelandia: northern et middle islands, in sylvis ad Patea et Tararua; Akaroa (Rasul).

3—4-pedalis. Spica 1—7 pollices longa, rachis flexuosa plana, marg. ciliata. Spiculae cum aristas ½—¾ poll. longae, internodiis duplo longiores.

917. **HORDEUM** Linn.

(Walp. Ann. III. 786.)

1. **HORDEUM ITIABURENSE** Boiss. diagn. XIII. p. 70.

H. annuum glabrum culmis erectis foliosis, foliorum limbo flaccido pallide virenti margine scabro, spica e folio summo remotuscula lineari a latere vix compressa, rachide fragillima compressissima utroque margine dense ciliata spiculis ternis, lateralibus masculis muticis, intermedio aristato unifloro cum flosculo sessili setaceo plumoso, glumis aequalibus linearibus dense et adpresse setosis in aristam setaceam flosculo paulo longiorem abeuntibus, palea flosculi fertilis dura glabra dorso bisulcata in aristam validam complanato-trigonam margine scabram sensim attenuatam rectam longissimam abeunti, palea superiori aequilonga apice retusa.

Hab. in declivibus siccis montis Ithaburis in latere meridionali supra Daburieh.

Sesquipedalis, spica absque aristas $1\frac{1}{2}$ —2 pollicaris, glumae 7—8 lineas longae arista semipedalis basi lineae $\frac{3}{4}$ lata. Species pulcherrima ob aristas ingentes nulli propius affinis, prope *H. vulgare* et distichum collocanda.

2. **HORDEUM VIOLACEUM** Boiss. et Hoh. in Kotsch. pl. Pers. bor. 1846. — Boiss. diagn. XIII. p. 70.

H. perenne caespitosum, radice fibrosa, culmis erectis basi non incrassatis, foliis radicalibus numerosis caulinisque sparsis scabridis rigidiusculis limbo abbreviato, spicis violaceo-nigricantibus linearibus vix compressis axi fragillima hirtula, spiculis ternis unifloris cum rudimento subulato flosculi superioris, glumis subulatis scabris flosculos aequantibus, flosculis lateralibus masculis muticis saepius minoribus subpedicellatis, palea inferiori floris hermaphroditi lanceolato-lineari in aristam brevem ea breviorum abeunti, superiori aequilonga acuta.

H. pratense var. nodosum Griseb. Gram. Ross.

Hab. in pinguibus ad radices montis Demawend prope Lar. Kotsch. n. 325 et in monte Totschal prope Teheran alt 8000' n. 3, in faucibus montis Elbours, n. 643, in monte Kuh Daena Persiae australis Kotsch. n. 684 sub *H. bulbosi* var.

Culmi 2—2½ pedales, spicae 1—2 pollicares, spiculae circ. 2½ lin., aristae longiores 3 lineas tantum longae. Affine *H. bulboso* cujus olim varietatem esse credideram sed a quo differt culmis non solitariis nec basi bulbosis, glumis flosculos non superantibus, palea floris intermedii in aristam ea breviorum nec longiorum abeunti.

3. **HORDEUM PRATENSE** Huds. — Steud. Synops. p. 352. *H. secalinum* Schreb.; Lge. et Willk. Prodr. fl. hisp. I. p. 103.

β. *annuum* Lge. (pag. 1. 54). Differt a specie radice annua et statura humiliore.

Hab. in pratis ad pagum Guadarrama Hispaniae (Lge.).

4. **HORDEUM TRIFURCATUM** Jacq. Baillon Bulet. de la Soc. bot. de France I. (1854.) p. 187.5. **HORDEUM ENCLAUSTON** Steud. Synops. p. 353, ex J. Gay forsan = *H. pusillum* Nutt. et *H. Riehlii* Steud. Synops. p. 353 ex Mississippi.6. **HORDEUM BERTEROANUM** Em. Desv. Gram. chil. in Gay fl. chil. t. VI. p. 460.

H. annuum, caespitosum, radicibus tenellis; culmis basi non tunicatis, 6—9-pollicaribus, 3—4-nodis, omnibus fertilibus, foliorum vagina superiore inflata; ligula truncata, vix nulla; lamina angusta, utrinque pubescente, apice subcartilaginea; spica cylindracea, obovata, 1—1½ pollicari; racheos articulis apice quam basi duplo latioribus; spiculis ternis, omnium glumis subaequantibus, e basi omnino setaceis, 6—10 lin. longis, rectis, non ciliatis; floribus lateralibus 1-paleaceis, setaceis; hermaphroditi paleis subaequalibus, 3½—4 lin. longis; inferiore lanceolata, apice biloba, inter lobos breviter setaceis aristata, arista glumas subsuperante; superiore elongato-attenuata, in apice angusto bimucronata.

β. pumila. Culmis 1—2-pollicaribus; vaginis 2 ventricosis; spiculis tantum 5 lin. longis.

Hab. in campis circa Santiago (Gay); la Serena prov. Coquimbo (Gay); San Joaquin (Bertero n. 331); Rancagua (Bertero). — Var. *β.* Coquimbo (Gay).

A *Hordeo maritimo* differt glumis omnino setaceis et spicula non exacte cylindrica.

7. HORDEUM COMOSUM Presl. Rel. Haenck. I. 327 Kth. Agr. p. 457. Steud. Synops. p. 353. n. 27. — *H. andinum* Trin. Gram. Poepp. in Linnaea (1835) p. 304. Steud. Synops. 353 n. 26 et *H. cylindricum* Steud. I c. n. 25 (?). — *H. jubatum* Hook. fil. Flor. Antart. I. p. 388 non L. sp. p. 126 nec Kth. En. plant. 1 p. 457. — *H. divergens* Nees et Meyen Hb. berol.

α. flavescens. Culmo pedali; vagina summa ventricosa; glumis 12—13 lin. longis.

β. rigida. Culmo rigido, 6—15-pollicari, superne nudo; vaginis arctis; foliis glabrescentibus; glumis minoribus.

γ. humilis. Culmo 3—5-pollicari; foliis vaginisque tomentosis; spiculis saepius violaceis; glumis 9 lin. longis.

Em. Desv. Gram. chil. in Gay fl. chil.

918. AEGILOPS Linn.

(Walp. Ann. III. 787.)

1. AEGILOPS UNIASTATA Vis. — Vis. fl. Dalm. III. p. 345. (Add.)

Spica brevis cylindrica, spiculis binis fertilibus, glumis bidentatis, dente altero ovato mucico, alterius arista glumellae bicuspidatae mucrones longe superante, spiculae terminalis abortivae glumis lanc-subulatis longissimis. —

Syn. *A. ovata* Alsch. fl. Jadr. p. 23, et *A. caudata*? ex herb.! nec alior. et excl. diagn.

Hab. in herbid. c. Zara. fl. Majo. ☉

2. AEGILOPS VULGARI-TRIUNCIALIS Lge. (pug. I. p. 56):

Pedalis et ultra, erecta, foliis planis glabris, vaginis ciliatis, spica cylindrica compacta absque aristas 2—3" l. e spiculis 7—8 oblongis non ventricosis rachi arcte adpressis composita, glumis ad nervos scabris, spicularum inferiorum bidentatis, dente rachi proximo elongato in spiculis mediis in aristam spiculis longiorem productis, in spiculis summis (sterilibus) bidentatis e sinu longissime aristatis, aristas omnibus rectis scaberrimis. —

Lge. et Willk. prodr. fl. hisp. I. p. 108.

Ae. cylindrica var.? longe aristata Lge. pl. exsicc.

Hab. in agris pr. Madritum Hispaniae cum Ae. ovata et triunciali: Lge.

Habitu magis Triticum quam reliquis congeneribus similis, aliquantum tamen ad *Ae. cylindricum* accedit, qualem ex agro Vindobonensi possideo, magis vero plantae sub nomine Ae. squamosae var. comosae Coss. et Balansa (n. 695 ad Miserghin lectae) distributae similis est, sed haec differt a nostra glumis magis ventricosis, apice reflexo etc. Cum *Ae. triunciali* convenit spica elongata aristasque apicem versus longioribus, quare hujus et Triticum vulgaris hybrida proles forsitan censenda est.

3. AEGILOPS OVATA L. — Steud. Synops. p. 354,

β late-aristata Lge. (Pug. I. p. 56.) Glumis 2—3-aristatis, aristas planis latis 5-nerviis. Planta robusta. Lge. et Willk. Prodr. fl. hisp. I. p. 107.

Hab. prope Jaen Hispaniae (Lge.)

Tribus XII ROTTBOELLIACEAE Knth. gr.

922. **LEPTURUS** R. Br.

(Knth. en. I. 462 suppl. 373.)

1. **LEPTURUS PERSICUS** Boiss. diagn. XIII. p. 71. Sect. (Pholiusus).

L. annuus culmo paulo supra basin ramoso erecto inferne folioso cito in spicas lineares cylindricas longas rectas abeunti, vaginis foliisque brevibus retrorsum scabridulis, rachide spicae fragillima dorso convexa albo-marginata articulis spiculis aequilongis, glumis duabus coriaceis extus convexis sub lenteque adpresse hirtulis plurinerviis apice obtusis vix et brevissime membranaceis aequilongis flosculis paulo superantibus rachidi arcte adpressis altera paulo angustiori, flosculis binis rarius solitariis, paleis aequilongis albo-membranaceis lanceolato-linearibus obtusiusculis glaberrimis.

Hab. in Persia australi Aucher n. 2914.

Planta habitu spicisque rectis cylindricis 3—4 pollices longis L. cylindricum referens sed statim ab eo glumis bivalvibus distinguenda. Spiculis bifloris in subgenere Pholiuso prope L. pannonicum collocandus qui a nostra specie glabritie, rachide spicae multo tenuiori, spiculis a rachide sejunctis nec ejus excavationibus arcte incumbentibus minoribus, paleis apice bidentatis nec integris facile dignoscitur.

925. **HEMARTHRIA** R. Br.

(Knth. en. I. 465. suppl. 375.)

1. **HEMARTHRIA VAGINATA** Büse. — Büse in pl. Jungh. III. p. 354.

Spicis plurimis infra folia vaginatis, glumis longe acuminatis omnibus subliberis culmo c. vaginis amplis compresso, prostrato?

Habit. insulam Javae pr. Tjibogo. (Jungh.) Affinis H. uncinatae R. Br. etc. —

927. **ROTTBOELLIA** R. Br.1. **ROTTBOELLIA MURICATA** Retz. (Kunth. agr. p. 467.) — Büse in pl. Jungh. III. p. 355.

(Var.?) β; stirps Javanica, obscure virens, spicis fere glabris, gluma spiculae sessilis ovato-lanceolata, pedicello superne attenuato, dentibus plerumque 2 validis.

Hab. in Javae m. Salak. (Jungh.)

Tribus XIII. ANDROPOGONEAE Knth. gr.

937. **LUCAEA** Knth.

(Knth. en. I. 472 suppl. 382.)

1. **LUCAEA VIRIESII** Büse. — Büse in pl. Jungh. III. p. 366.

Spicis 3—5, 3 v. 4-spiculosus, spiculis valde angustis, rhacheos articulis infra barbatis, pedicellis sterilibus nullis, fl. diandris. f. cordato-lanceolatis vaginis internodiis multo brevioribus, suprema longa c. lamina exigua, culmo erecto.

Hab. ins. Javae pr. Tjibogo. (Jungh.)

Char. generis quem Kunth exhibuit quodammodo mutandus est, hinc lege ibidem Spiculae solitariae c. pedicello sterili vel nullo stamina 3 vel 2. — Culmus 3-pedalis etc. — Nomen specificum dedimus in honorem celeb. viri. herbar. Junghuhniano Acad. Lugd. Batav. praepositi. —

2. LUCAEA TYPICA Buse. — Buse in pl. Jungh. III. p. 367.

Spicis multis subdigitato-approximatis, 3—12-spiculosis, rhacheos articulis pedicellisque sterilibus tota longitudine barbatis, spiculis lanceolatis, f. anguste cordato-lanceolatis, marg. tuberculato-setosis, culmo b. decumbente.(?)

Hab. ins. Javae, in silvis mont. Merapi alt, 4800' et in m. Merbabu. (Jungh.) — Robusta, etc.

ANTHISTIRIEAE Anders.

Anderson Monogr. Andropogonearum 1856 I. p. 3.

ANTHISTIRIEAE ab omnibus ceteris Andropogoneis dignoscuntur: spiculis inferioribus 4 masculis v. neutris ceteras centrales et pedicellatas ut in involucrum annulare cingentibus. Spicae, e spiculis septem v. plurimis heterogamis compositae, vaginis s. bracteolis involutae v. saltem (Exotheca excepta) suffultae sunt, unde proprium praese ferunt habitum quoad paniculam hae plantae, ad Hypparheniam et Cymbanthelem eo respectu accedentes. Quae itaque spiculae involucrantes et bracteolae ut primariae habendae sunt partes, quae ad genera et species dignoscendas valere debent. Genera a nobis hic recepta sequente modo igitur disponuntur.

1. Spicae bracteolis involutae v. arcte suffultae:

a. Spiculae involucrantes inaequaliter sessiles:

* Spicula hermaphr. singula, masc. pedicellatae 2. . . Anthistiria L.

** Spiculae hermaphr. binae v. plures, masc. pedicellatae 3 v. plures Androscopia Brong

b. Spiculae involucrantes longius, subaequaliter pedicellatae

Iseilema And.

2. Spicae bracteolis destitutae Exotheca And.

ANTHISTIRIA L. (And.)

(Walp. Ann. III. 794. — Anderson monogr. Andropog. I. p. 4.)

Panicula axi continua. Spicae bracteolis involutae; e spiculis septem compositae; spiculae 4 externae subaequaliter sessiles, masculae v. neutrae, sessiles, involucrum formantes; spiculae centrales pedicellatae 3, una fertilis aristata, duae a b. fertiles pedicellatae masculae v. neutrae.

Vide l. c. descr.

a. Glumae exteriores spicularum involucrantium pilis albis v. pallidis sparsim hispidae v. omnino destitutae.

* *Heteroelytron*: Spiculae involucrautes et centr. neutrae membranaceae subabortientes; bracteolae longe foliiferae.

1. ANTHISTIRIA JUNGHUNIANA Nees (herb. et ms.) Anders. l. c. p. 5.

Panicula discreta, racemosa, ramis spicigeris geminis v. solitariis ap. flexuosis; pedunculis brevibus glabrusculis; fasciculis maximis, e spicis 5—10 compositis; bracteis foliiferis et bracteolis herbaceis, marg. e tuberculis hispidis; spiculis involucrantibus et pedicellatis centralibus glaberrimis; spicula hermaphr. barba rufa cincta, ap. hispida, arista maxima rufa-hirsuta; f. planis; culmis caespitosis. — Syn. Anth. setosa Thunb. herb. — Perobachne secunda Presl. (Steud. syn. p. 403.) — Aristaria mutica Hassk. n. gen. et sp. pl. 12. — Anthistiria mutica Steud. Syn. p. 401 n. 25; Buse pl. Jungh. III. 341. — Heteroelytron scabrum Jungh. (Steud. l. c. 403.) — Androscopia gigantea Buse pl. Jungh. l. c.

Hab. in insula Java.

Var.: a. *minor*: culmo 2—3 ped., b. foliis dense stipato.

Hab. ad Tijbogs.

b. *altior*: culmo, humana altitudine (Jungh.)

α. *pilosissima*: bracteis densissime albo-hirtis, foliis etiam e tuberculis frequentius pilosis.

β. *glabrescens*: bract. pilis tantum paucis marginalibus relictis glabrusculis. Hab. in rupib. montis Gunong Mandjesinang.

Culmus 2—20 ped. caet.

** *Euanthistiria*: Spiculae involucrantes et centrales pedicellatae ut plurimum masculae, semper glumis binis, rite evolutis, coloratis instructae; bracteolae saepius subaphyllae. — Spicae in fasciculos bracteis arcte involutos plerumque conglomeratae. Panicula ut plurimum rara, racemosa.

2. ANTHISTIRIA PUNCTATA Hochst. (Schimper it. Abyss. n. 73. et 1555). — Anders. l. c. p. 6:

Culmo erecto simplici, apice nutante, nitente, v. nodis glaberrimo; f. angustis elongatis subglaucesc. c. vagina nudis; panicula terminali, racemosa, flexuosa, nutante; fasciculis longe pedunculatis, e spicis 3—4 magnis compositis; bracteis foliiferis c. bracteolis dorso nigro-punctatis et pilosis; arista longissima; spiculis terminalibus pedicellatis glabrescentibus.

Anth. punctata Rich. Fl. Abyss. II. 488. Steud. syn. p. 400. n. 5.

Hab. in Abyssinia in montib. pr. Dochli provinciae Sana et in monte Scholada. —

Cl. Nees hanc speciem formam tantum maxime elatam et hispidam *A. ciliatae* habet. —

3. ANTHISTIRIA SCANDENS Roxb. (Fl. Ind. 253.) Anders. l. c. p. 7.

Culmo ramoso, volubili, glabro nitente; nodis incrassatis laevibus; f. planiusculis linearibus, c. vaginis glabris; panicula ramosa, fasciculis verticillatis, sessilibus, e spicis 3—9 compositis; bracteis marg. e tuberculis hispidis, bracteolis subglabris; spicis involucrantes versus ap. pilosis, spicula herm. violacea, superne scabriuscula; arista admodum crassa, ferruginea, longissima; spiculis terminalibus glabriusculis acutis.

Anth. scandens Trin.; Nees Fl. Afr.; Steud. Syn. 401. n. 21.

Var. α. *hispidata*: bracteis et bracteolis c. glumis spicularum invol. e tuberculis setosis.

Hab. in India or.: Himalaya, Kunawur; (Royle herb. n. 244.) In ins. Mauritii (Sieb. Fl. Maurit. II. n. 47).

Nomen *Anth. barbatae* vulgo tritum ad formas varias glumis hispidis pertinere, videtur.

Var. β. *subimberbis*: bracteolis et glumis spicularum invol. rarius pilosis.

Hab. in Nepalia, Himalaya: Wall. Cat. n. 8761. pp.

4. ANTHISTIRIA ARGUENS Willd. (sp. pl. IV. 2 p. 901. n. 4.) Anders. l. c. p. 8:

Culmo erecto simplici, c. nodis glabro, f. linearibus elong. b. subciliatis c. vaginis glabris; panicula elongata composite racemosa; fasc. cernuis, globoso-capitatis, e spicis numerosis compositis; spiculis involucrantes acutis, vers. ap. saepissime tuberculatis piligerisque; spic. hermaphr. acutiuscula; arista longissima, apice pallidiori; spiculis terminalib. acutissimis glabris.

Syn: *Stipa arguens* L.

Anthistiria polystachya Roxb. (Knth. en. I. p. 481.) Steud. Syn. I. p. 401—20.

Anth. arguens Willd. Knth. p. 482.; Nees.; Steud. 401. n. 18.

Variat: a) *hispidata*: bracteis bracteolisque foliiferis marg. tuberculato-pilosis (Specim. Wallichiana).

b) *glabriuscula*: bract. et spiculis involucr. pilis et tuberculis fere destitutis subimberbilibus. (Specim. Wightiana).

Hab. in Ind. or. Tavoy, et in prom. bonae spei in herbis convallium alt. 1500'.

c) *japonica*: culmo graciliore, vaginis ad marg. superiores tuberculato-pilosis, panic. rariori, fasciculis glauco-ferrugineis, bract. densius tuberculato-hispidis, glumis spicularum invol. minus pilosis.

Anth. japonica Willd. sp. — Steud. Syn. 401. n. 26. (qui *Andropogon ciliatum* Thunb. huc etiam refert.)

Hab. in Japonia. Specim. a Reinwardtio lecta vidimus. Forma Japonica ab hac specie nullis notis, vix etiam habitu differt.

5. ANTHISTIRIA CILIATA Retz (Obs. III. p. 11). Anders. l. c. p. 9:

Culmo erecto ramoso nitente nodis glabris v. barbatis; fol. linearibus, attenuatis, saepe a tuberculis pilosis: panicula simpliciuscula subracemosa; fasciculis erectis v. saepius cernuis, e spicis 2—4 compositis, obovato-elongatis; bracteis bracteolisque circa margines saepe e tuberculis pilosis v. omnino glabris; spicul. invol. versus apicem plerumque hispidis; arista longa; spiculis terminalibus glabris.

Syn. *Andropogon nutans* Linn. Mant. 2. 203.

Androp. quadrivalve Linn. Syst. ed. 13. 758.

Anth. ciliata Linn. fl. (nomen sine dubio collectivum) Willd.; Nees; Roxb.; Knth.; Steud. 401.

Anth. barbata Trin. Act. Petrop. II. 3 p. 322.

Var. a) *hispida*: bract. dorso et spiculis involucr. magis minusve hispidis.

b) *ciliata*; (imberbis); spic. involucr. dorso subglabris.

c) *mallicoma*: spiculis involucr. bracteis et vaginis densius et molliter villosis.

Hab.: In editiorib. Africae australis, tum in littore australi et occidentali campos illos format graminosos late extensos atque in summos etiam montes adscendentes. Nees.

* *Natalensis*: Culmo vix pedali; f. ad b. fasciculatis, fere curvatis; panicula rara, fasciculis e spicis 2 compositis, bracteis bracteolisque b. violaceis glabris; spicis terminalibus solito longius pedunculatis.

Hab. in Port Natal Africae austr.

** *hortensis*: fasciculis brevioribus magisque rotundatis; spicula hermaphr. apice bifurcata.

In horto Berolinensi cultam vidimus. — Est sine dubio per terras omnes calidas late dispersa species, quamquam specim. certa tantum ex Africa vidimus.

Haec species, Euanthistiriae centrum, a ceteris formis vix certe distingui potest.

Formae normalis haec descriptio: confer l. c.

6. ANTHISTIRIA ARGENTEA Nees (Gram. Afr. austr. p. 127.) Anders. l. c. p. 11: 32

Culmo ramoso, procumbente v. ascendente villosa, nodis dense barbatis, f. vaginisque argenteo-sericeis; panicula simpliciter racemosa; fasciculis spicas 2—3 includentibus obovato-truncatis; bracteolis glaberrimis; spiculis involucr. glabris v. tenuiter pilosis acutiusculis. — Steud. Syn. 401. n. 17.

Hab. in terra Caffrorum, in desertis dumosis Karro calcareisque alt. 600. (Eckl. Drège). — Accedit ad *Anth. ciliata* β. in herbem, sed diff. integumento argenteo-micante e villis mollibus longe incumbentibus in adultioribus foliis denique diminuto neque vero toto evanescente. Fasciculi paulo minores quam in *A. ciliata*. — Nees l. c.

7. ANTHISTIRIA GLAUCA Desf. (Atl. 2. 280. tab. 257.) Anderson monogr. *Andropog.* I. p. 12:

Culmo ramoso stricto, b. saepe canalicato, c. nodis glabro, glaucescente, foliis longissimis angustatis, c. vaginis glaberrimis, glauco-irroratis; panicula fasciculis 2—5 in pedunculis axillaribus simplicibus anguste racemosa, terminali; fasciculis e spicis 3—5 compositis; bracteis foliiferis c. bracteolis aphyllis glabris, glaucescentibus; spiculis involucr. acutis glabris.]

Syn. *Stipa paleacea* Willd.; Vahl.

Anth. glauca Desf.; Willd.; Knth. en. I. 482. Steud.

Anth. imberbis Desf. Journ. d. ph. 40. 292. t. 1.

Cal. imberbis R. et S. II. 810.

Anth. Desfontainii Knth. Gram. I. 161. enum. I. 481.

Hab. in Algeria; Barbaria, Aegyptus, Guinea. Proxima sane videtur *A. ciliatae* cuius forma locis maxime arenosis, aridis desertorum enata, forsitan sit appellanda.

8. ANTHISTIRIA PUBERULA Anders. l. c. p. 12.

Culmo erecto, simplici glabro nitente, nodis pilosiusculis; f. linearibus planiusculis, supra nudis et nitentibus, subt. pallidioribus puberulis; ligula brevis lacera; panicula anguste racemosa, ramis simplicibus fasciculos 4—5, e spicis 2—3 compositis, gerentibus; bract. margine pilosis, bracteolis glabriusculis; spiculis invol. late marginatis in nervis exterioribus sparsim pilosis; arista longissima supra medium geniculata, inferne castaneo-pilosa; spiculis terminalibus anguste lanceolatis glabris.

Hab. in India or. Wall.; et in Himalayae montib. Royle.

Est *A. ciliatae* sat similis, ita ut forsitan varietas mera dicenda.

9. ANTHISTIRIA CAESPITOSA Anders. l. c. p. 13.

Culmis valde caespitosis strictis, nodis saepius pilosis, f. strictis longissime acutatis scabris utrinque nudis, vaginis ore pilosiusculis; panicula stricta elongata; fasc. magnis e spicis subquinis compositis; bract. et bracteolis glabris; spiculis involucr. late lanc. acutiusculis, inter nervos transversim rugulosis, tuberculis subpilosis infra apicem interd. conspersis; arista longa.

Hab. in Nova Hollandia occid. (Drummond.)

Ad *Anth. australem* quacum maxime congruit se habet ut *A. arguens* ad *A. ciliatam*. Est enim omnib. partib. major et robustior etc.

10. ANTHISTIRIA AUSTRALIS R. Br. (Prodr. Fl. Nov. Holl. I. 200). Anders. Andropogon. monogr. I. p. 13.

Culmo subsimplici erecto, apice nutante, c. nodis glabro; foliis angustis cum vaginis nudis, panicula racemosa, ramis simpliciusculis laxis; fasciculis erectiusculis obovatis, e spicis 2—5 compositis; bracteis bracteolisque foliiferis glabris; spic. involucrentibus acutiusculis, glabris nervosis; arista longissima; spicis terminalibus acutissime lanceolatis glabris.

A. australis R Br.; R. et S.; Trin.; Knth. en. I. p. 402. Steud. Syn. 402. n. 29.

Hab. in Nova Hollandia: Ad Port Jackson et in Tasmania. In ins. australibus.

Haec species, quae in terra austr. *A. ciliatam* africanam, mediantibus *A. arguente* indica et *A. caespitosa*, omnino simulat, ut ea etiam eximie variat:

colorata: fascic. violaceis, bract. longe foliaceis; f. ad bas. culmi magis collectis et angustioribus.

a. *major*: spicis majoribus, culmo erecto.

b. *minor*: spicis minoribus, culmo apice nutante.

concolor: fasciculis fulvescentibus; bracteolis subaphyllis; culmo robustiori; fol. latoribus, planiusculis; glumis spic. involucrent. ad ap. tuberculis raris subinde conspersis.

pubescens: dense caespitosa, nodis culmi albo-barbatis; fol. angustissimis ad b. culm. praesertim fasciculatis, vaginis ore ciliatis; panicula rara; fasc. minoribus; spic. hermaphrod. longius pedicellata; arista parte superiore erecta, glabra.

11. ANTHISTIRIA CUSPIDATA Anders. l. c. p. 14.

Culmo erecto, inferne ramoso et foliato, c. nodis glabro; f. angustissimis v. vaginis glabris strictiusculis; panicula parva, fasc. solitariis in pedunculis erectis subfastigiatis; bracteis bracteolisque foliiferis, glabris; spic. involucrent. lanceolatis longissime acutatis, glabris; spicula hermaphr. tenuiter puberula; arista longa; spicis terminalibus cuspidatis.

Hab. in Nova Hollandia, Gaudich.

12. ANTHISTIRIA LAXA Anders. l. c. p. 15.

Culmo gracili, c. nodis glaberrimo; f. anguste linearib., inferne ciliatis, vaginis vel e tuberculis pilosis; panicula rara elongata racemosa, pedunculis longis laxis fasciculos solitarios vel geminos gerentibus; bracteis foliiferis, ad marg. vaginae tuberculatis et pilosis, bracteolis brevibus, etiam fere foliiferis, glabris; spiculis invol. lanceolatis acutis glabris v. pilis paucissimis ad ap. ciliatis; spic. hermaphr. lata, eburnea; arista longa; spiculis terminalibus lanceolatis acutis.

Hab. in Nepalia (Wall. n. 8775).

Est gramen insigne. Transitus tamen praebent nonnulla spicimina ad *A. ciliatam*.

13. ANTHISTIRIA DEPAUPERATA And. l. c. 15.

Culmo simplici gracili, c. nodis glabro; f. anguste linearib. acutatis c. vaginis nudis; panicula rara erecta, ramis strictis, fasciculos e spicis 2—3 compositos, ap. gerentibus; bracteis foliiferis, ad margines tenuiter v. crebre tuberculatis et pubescentibus, bracteolis subaphyllis glabris; spiculis invol. late ovalis acutatis ad ap. tuberculis paucis piligeris scabris; arista spicam duplo superante rectiuscula; spic. terminalib. acuminatis glabris.

Hab. in ins. Luzonia e Philippinis (Cuming n. 1873 et 1673).

*** *Cymbaria* And. l. c.: Spicae solitariae, e media bracteola exsertae.

14. ANTHISTIRIA CYMBARIA Roxb. (fl. Ind. l. 255). — Anderson monogr. Andropog. p. 15.

Culmo valido, ap. pendulo c. nodis glabro; f. longissimis angustis c. vaginis glabris; panicula ramosissima secunda; bracteis et bracteolis aphyllis, angustis glabris, acutis; spicis anguste ovatis; spiculis invol. longissime acutatis, glaberrimis nervosis; spica hermaphr. eburnea acuta dorso glabra; pedicello glabrescente; arista gracili, spicam triplo superante, medio geniculata; spicis terminalib. acutis glabris.

Andropogon cymbarius Linn.; Wild.; Sprgl.

Cymbogon elegans Sprgl., R. et S.

Anthistiria Cymbaria Roxb. (Knth. en. l. 482), Steud. Syn. l. 399. n. 1.

Hab. in Peninsula Indiae or.

b. CHRYSANTHISTIRIA. Glumae spicularum involucrentium pilis longis fulvis vel rufescentibus densissime hirsutae. Spicae discretae, solitariae e bracteolis plus minus exsertae:

15. ANTHISTIRIA ARUNDINACEA Roxb. (fl. Ind. l. 256). — Anders. l. c. p. 16.

Culmo erecto valido, c. nodis glabro; f. longissimis rigidis, marg. scabris, c. vagina ore pilosa glabris; panicula pl. m. elongata, ramosissima densa; spicis longissime pedunculatis solitariis erectis; pedunculo scabro piloso; bracteolis aphyllis, glaberrimis; spiculis involucre. cuspidato-aristatis, pilis fulvis longissimis, subdivaricatis densissime hispidis; spicula hermaphr. aureo-hirsuta, spiculis terminalibus aristato-cuspidatis, hispidis; arista spicam 6—10 ies superante.

Anth. arundinacea Roxb. (Knth. en. l. p. 482). (Steud. Syn. p. 401. n. 22.)

Var. *effusa*: panicula subrara (fere ut in *Avena fatua*), pedunc. protractis, laxis, tomento spicularum aureo-nitente.

Var. *contracta*: panicula valde elongata, ramosissima et condensata, tomento spicularum opaco.

Hab. in Bengalìa, Nepalea, Himalaya: Kunamur.

* *subsericans* Nees.

Culmo minus valido internodiis summis saltem inferne pilosis, f. subt. pilosis, spicis e bracteolis longius exsertis, pedunculis pilis cinerascensibus divaricatis hirsutis, spiculis brevioribus pilis rariorib. erectis obsitis; arista breviori.

Anth. subsericans Nees (Steud. Syn. l. 401. n. 23.)

Haec forma mihi ab *A. arundinacea* Roxb. non adeo distincta videtur, ut propriam constituat speciem. (Ands. I: c.)

16. ANTHISTIRIA VULPINA. — Anders. Androp. monogr. I. p. 17.

Culmo erecto crasso glaucescente, intra nodos, glabros hirtio; f. strictis angustis, marg. revolutis laete viridibus, vaginis superne brevissime ferrugineo-ciliatis; panicula elongata, angustata, ramis brevib. divisis; spicis quasi in fasciculos raros subapproximatis, bract. foliaceis ad marg. tuberculatis et pilosis, bracteolis aphyllis, glabris, spiculis involucr. acutissimis, grosse tuberculatis et dense fulvo-hispidis; spic. hermaphr. dorso appresse cinereo-fusco-tomentosis, arista spicam triplo superante; spiculis terminalibus acuminatis fulvo-hirsutis.

A priore differt: culmo multo graciliore caet.

Habit?

17. ANTHISTIRIA BRACHYANTHA Boiss. diagn. XIII. p. 71.

A. perennis glauca radice fibrosa caespitosa, culmis erectis simplicibus teretibus flavidis foliosis parte superiori obtuse angulatis, foliis linearibus planis rigidulis inferioribus secus vaginas superioribus ad basin limbi sparsim setis longis e tuberculo ortis obsitis margine et ad nervos scabris, ligula brevi truncata fimbriolata, fasciculis spicularum 4—5 pedunculo filiformi suffultis infimo remoto caeteris terminalibus omnibus nutantibus singulis spatha glabra lanceolata acuminata plicata suffultis iterum in 3—4 glomerulos spathis lanceolatis dimidio minoribus suffultis divisis, glomerulorum 1 vel 2 e spiculis hermaphroditis masculisque caeteris e spiculis neutris muticis tantum constantibus, spiculis neutris vel masculis sessilibus basi glabris, glumis exterioribus viridibus oblongo-lanceolatis cucullatis acutis dorso multinerviis margine rufescenti-membranaceis superne setis nonnullis e tuberculis crassis ortis obsitis, glumis interioribus hyalinis. spicula hermaphr. pedicello longe rufescenti barbato suffulta ad apicem pedicelli 2 spiculis abortivis subulatis viridibus iterum pedicellatis aucta biglumi, glumis aequilongis oblongis obtusis subcoriaceis exteriori apice breviter puberula interiorem arcte involventi, arista flosculi rufa contorta inferne hirsuta spiculas multoties superanti spatha fasciculorum fere longiori.

Hab. in siccis dumosis Syriae littoralis ad radices australes jugi Cassii inter Laodiaceam et Suadieh. Legi Junio 1846.

Circ. tripedalis, folia radicalia fere sesquilineam lata 4—6 pollices longa, spicularum neutrarum bracteeae $3\frac{1}{2}$ —4 lin. longae, arista sesquipollicaris.

Cfr. Anders. in monogr. Andropog. I. p. 11.: Incertus sum utrum ad *Anth. ciliatam* vel *glaucam* pertineat an ut propria species habenda sit.

18. ANTHISTIRIA SYRIACA Boiss. diagn. XIII. p. 72.

A. perennis glauca radice . . . , culmis parce ramosis inferne obtuse superne acutiuscule angulatis supra nodos incrassatis, foliis glaberrimis linearibus planis rigidulis utrinque scabridis, ligula brevi ovata fimbriata fasciculis pedunculis filiformibus suffultis nutantibus 2—5 in culmi parte superiori, inferiori remoto, omnibus spatha lanceolata-lineari longe acuminata plicata inferne marginibus ciliata suffultis iterum e 3—4 glomerulis constantibus, glomerulis omnibus e spiculis marginalibus neutris sessilibus centralique pedicellato hermaphroditis constantibus singulis spatha lanceolata minoris paulo longiori stipatis, spicularum neutrarum glumis exterioribus oblongo-lanceolatis acutis viridibus multinerviis margine membranaceis superne setis paucissimis e tuberculo ortis obsitis, glumis interioribus hyalino-membranaceis, spicula hermaphrodita ad pedicelli rufosetosum apicem 2 spiculis quoque pedicellatis rudimentariis neutris viridibus lanceolatis obsita, glumis albidis coriaceis aequilongis obtusis exteriori apice hirtio-scabrida interiorem arcte involventi, arista flosculi contorta rufescenti spiculis multo longiori spatham fasciculorum aequanti.

Hab. in regione sylvatica inferiori jugi Cassii in Syria boreali ubi legi non procul a praecedenti Jun. 1846.

Planta praecedenti major, folia longiora semper glabra, fasciculorum spatha 3-4 nec bipollicaris margine inferne ciliata nec glaberrima, glumae spicularum neutrarum majores acutiores 5-6 lineas longae setis parcissimis e tuberculo minori ortis, spiculae neutrae hinc ad basin floris hermaphroditi sitae lanceolatae nec subulatae. — *A. glauca* Desf. huic speciei affinis differt culmo compresso, glumis florum neutrorum praeter cilia nonnulla ad apicem sita tuberculis prorsus destituta glaberrimis, pilis secus pedicellum floris hermaphroditi sitis multo brevioribus aliisque notis. *A. punctata* Hochstetter ex Abyssinia affinis quoque, spathis undique hispidis pilis e tuberculis nigris ortis, glumis longe pilosis, etc., statim distinguitur.

Cfr. Anders. in monogr. Andropogonearum p. 11: „Incertus sum utrum ad Anth. ciliatam v. glaucam pertineat an ut propria species habenda sit.“

19. ANTHISTIRIA SUBGLABRA Buse. — Buse in pl. Jungh. III. p. 363.

Fascic. spicularum parvis, partialibus remotiusculis patentibus in summo culmo positus, involucris glabris aut raris verrucis obsitis, glumis spicular. verticillatarum glabris, ovatis, crassis; culmo compresso, glabro.

Hab. Sumatrae graminosa vasta, Padang lawas dicta, pr. Pertibi, Horn, in herb. Jungh.

Clariss Andersonius in Andropogonearum monographia sua I. p. 11. de hac specie offert:

Superest aliquid dubio, an sit Anthistiriae ciliatae extrema variatio; transitus vero desiderantur.

Forsitan ad Anth. scandentem pertinet!

" " "	pilosos	<i>A. ciliata</i> Anders.

b) Spicula sessilis glabra:

* aristata:

Pedunculi et bracteolae glabri *A. aristata* L.pilosus *A. scabra* Anders.** mutica *A. mutica* L.*Apl. villosa* Schreb. et *Apl. digitata* e genere eliminandae, ut jam monuit Nees.

1. APLUDA CILIATA And. l. c. p. 177. tab. V.

Panicula effusa, lanceolato-elongata, apice nutante; fasciculis remotiusculis; spicis incurvis; bracteola spica dimidio breviori sub cuspidate herbacea bidentata, hyalinomarginata, subciliata; pedicello communi brevi, incrassato; spiculae fertili gluma exteriori pedicellos hirtos superante, extus puberula, interiori bidentata in carina superne scabram aequante; arista spiculam fere triplo superante, medio geniculata, superne flavescens; spicula tabescente dorso puberula; mascula terminali glabra; foliis petiolatis; supra subpilis, viridibus, latis, vaginis margine e tuberculis pilosis.

Hab. in Asia (India orientali, Caruar: Hügel n. 1639).

Est *A. communi* maxime affinis, sed abunde differt: culmo multo elatiori et crassiori evidentius compressiusculo; foliis duplo longioribus (fere pedibus) et latioribus ($\frac{2}{3}$ unciam), supra pilis e tuberculis minutis egredientibus, paucissime pilosis basi longe petiolatis; sed maxime panicula et spicis. Panicula etc.

2. APLUDA ARISTATA And. l. c. tab. IV. — l. Amoen. Acad. 4. p. 303. sp. 1487.

Thbg. prodr. 21. Schreb. gram. 2. t. 42. Willd. Sp. pl. 4. 938. Lam. ill. t. 841. R. S. Syst. II. 841. Trin. Act. Petrop. p. 325. Kth. Agr. 516. Steudel Synops. p. 403 n. 1. — *Dictomis fasciculata* P. B. Agr. 160 (sec. Nees). — *Andropogon glaucus* Retz. obs. V. 20. Willd. Sp. IV. 2. 910 (sec. Nees, cui synonymon *Apludam glaucam* Schreb. Gram. II. 98 habet; Steudel Synops. l. c. n. 9). — *Apluda microstachya* Nees l. c. pag. 193.

Hab. in India orientali (Wight n. 1712. Wallich, n. 8760. Hügel n. 2102 et 3274. Sonnerat, Brown in Ceylon (Reynaud) et in Manila (hb. vindob.)

a) *grandis*: panicula ob ramos elongatos patentes effusa; spiculis 3—4 lin. longis; glumis exterioribus spiculae fertili basi laevibus.

β. *contracta*: ramis abbreviatis, fasciculis condensatis, coloratis.

b) *minor*: panicula subsimplici, erectiuscula, elongata; spiculis 2—3 lin. longis; glumis exterioribus basi subnervis. (*A. microstachya* Nees loco supra citato.)

* *nervosa* And. Panicula valde interrupta, ramis geminis arrectis, brevibus; fasciculis 2—3-spicatis, discretis; spiculis lateralibus horizontaliter divergentibus; bracteola spicam plus dimidio involucrans; spiculae fertili gluma exteriori valide nervosa, tota viridi, subovali; spiculae masculae glumis carinatis, nervoso-striatis.

Hab. in India orientali (Hügel n. 2682).

A vulgari *Apluda aristata* L. non parum recedit panicula strictissima, ramis brevibus arrectis veluti pectinato-spicatis, spiculis fere duplo minoribus, gluma exteriori spiculae fertili tota valide nervosa, arista breviori, infusca et foliis brevioribus. Unum tantum specimen vidimus, quare id specie distinguere non audemus.

3. APLUDA SCABRA And. l. c. p. 179. tab. III.

Panicula ramosa; ramulis et pedunculis strigosis; bracteis margine e tuberculis hirtis; bracteola cum cuspidate subulata spiculas subaequante; spicis rectiusculis; spiculae fertili gluma exteriori lineari-oblonga, nervoso-costata, spicula tabescente, apice vix glumacea, sublongiori, gluma interiori glaberrima; arista mox geniculata, tota torta, spiculam duplo superante, infusca; spiculae terminalis glumis acutis; foliis basi angustatis, scabris.

Hab. in Nepalia, Wallich, n. 8760 h.

Apludae aristatae tam affinis, ut valde dubius sim, num ab ea specie removeatur. Aliena tamen videtur, non tantum habitu toto exteriori, sed etiam structura foliorum, paniculae et spicularum. Folia enim etc.

4. **APLUDA MUTICA** (Linn. sp. pl. 1486. — Anders. l. c. tab. VI.) — Willd. sp. pl. 4. 938. Lam. ill. t. 871. Nees A. L. C. N. X. l. c. p. 192. Trin. l. c. p. 325. Kth. Agr. 516. Steudel. Synops. p. 403 n. 4. — *Calamina mutica* P. B. Agrost. 129. R. S. 810. — *Calamina gigantea* P. B. Agr. p. 129. — *Andropogon glaucum* Retz. (sec. Trinum). — *Apluda geniculata* Roxb. 1. 325. Kth. 517. (sec. Nees.) Steudel Synops. p. 404. n. 7.

Hab. in Coromandelia (Macé), Java (Blume et Thunberg), China (Meyen et Osbeck), Nova Caledonia (Labillardère) et Luzonia (Chamisso).

* *A. humilis* Ands. l. c. tab. VIb. Presl. Rel. Haenck. 314. sub *Calamina*: Panicula magis effusa; fasciculis longius remotis; spicis basi ovato-gibbis; spicula sessili tabescente longiori, basi sublaevi; spicula tabescente fere tota ad pedicellum redacta, apice tantum medio virescenti-glumacea; bracteola late ovali, spiculam dimidiam superante; culmo graciliori. — *A. humilis* Steudel Synops. p. 404. n. 3.

Hab. in Luzonia (Cuming n. 635).

A vera *A. mutica* me iudice non ita recedit, ut speciem propriam efficere possit. Transitus evidentes invenimus.

** *A. mucronata* (Steud. Synops. p. 404. n. 6—?) Anders. l. c. tab. VI c.: Panicula magis contracta; fasciculis subconfertis; spicis oblongo-linearibus; spicula hermaphrodita tabescente evidentius longiori; spicula tabescente apice glumacea; bracteola spicam dimidiam involvente, cuspidate elongata, herbacea, scabra mucronata.

Hab. in Manila (Meyen), et insula Bourbon (Gaudichaud).

Habitu paniculae et spicularum sed imprimis bractearum insignis, certissime attamen mera varietas. Quid Steudel suo nomine significat haud bene liquet; in nostram tamen diagnosis proxime quadrat.

Formam ab *A. humili* ad *A. mucronatam* aperte transitoriam misit Wallich (n. 8760 k' et l') ex horto Calcuttensi; quae bracteola herbaceo-cuspidata, spiculis magnis, fasciculis et foliis obscure viridibus a ceteris non parum recedere videtur.

950. **ANDROPOGON** Linn.

(Walp. Ann. III. 796.)

1. **ANDROPOGON AMAURUS** Büse. — Büse in pl. Jungh. III. p. 360.

Spicis subsolitariis, f. supremo diu semi-inclusis; spiculis lotis, sessilib. saepe biserialibus, pedicellatis nonnunquam sessilib. conformib.; glum. fusco-hirtis pilis nitentibus; f. vaginisque sparse pilosis, culmo prostrato.

Hab. ins. Javae (Zoll. n. 539 in herb. Acad. L. Bat.), in pratis pr. Bedojo, haud longe a monte Sewu (Jungh.).

Pl. prostrata; ram. erectis, spithamaeis, geniculatis, compressis. F. lanceol., hirsutiae varia.

2. **ANDROPOGON** (??) **ASTICTUS** Büse. — Büse in pl. Jungh. III. p. 360.

Ramis paniculae ovatae subverticillatis, flexuosis; pedicellis valde barbatis; spiculis planis, lanceol., sessilib., h. parce setosis; glumis omnibus breviter et rigide ciliatis; arista glumellae spiculam ter quaterne superante; culmo terete c. f. linearib. glabris nodis vix pilosis.

Hab. ins. Sumatram, in graminosis vastis pr. Pertibi. Horner in herb. Jungh.

3. **ANDROPOGON HIRTUM** L. (Cod. 7556). Steud. Synops. p. 384.

β. *longearistatum* Willk. (et Lge. Prodr. fl. hisp. I. p. 47): Vaginae glabrae, spicae laxiores, longioresque, aristae spicula fertili sextuplo longiores (a forma genuina

praeter aristam elongatam vix ac ne vix quidem differt. Occurrunt etiam formae intermediae!).

A. pubescens Vis. pl. dalm. Rehb. ic. f. 1499.

Hab. in Hispania sat frequens, ut in Castell. nova, Catal., Regno Valent., Murcic., in Granat. abundat.

4. ANDROPOGON (SORGHUM) HALEPENSE Pers. Sibth. — Steud. Syn. p. 394.

α. latifolium Willk. (Prodr. fl. hisp. I. p. 48): Culmi 5' l., foliorum limbus 1½—2' long. et ¾—1" lat. ad basin extus villosus, panícula pedalis et ultra.

Hab. in Hispania: Vega de Motril ad fossas agrorum Gossypii. — Cf. infra p. 1071. —

5. ANDROPOGON (SPODIOPOGON) POGONANTHUS Boiss. et Balansa in Bul. pl. orient. exsicc. n. 1338 (1857). Balansa Bullet. de la Soc. bot. de France 1858 p. 168.

Rhizoma caespitosum, subrepens. Culmi erecti, ramosi, cylindrici, laeves, glabri, parte inferiore saepe perennantes. Folia lineari-lanceolata, sensim acuminata, plana glabra vel tantum basi pilosa: ligula membranacea, ovali obtusa, saepe laciniata; vaginae glabrae laeves, usque ad basin fissae. Panícula terminalis, ramosa oblongo-lanceolata, contracta. Spiculae homogamae, biflorae, terminales ternatae spiculis lateralibus pedicellatis caducis, media sessili persistente; ceterae genuinae, una pedicellata caduca, altera sessili persistente. Flosculus infer. spicularum masculus, superior et hermaphr. Glumae oblongo-lanceolatae, acuminatae vel sat longe aristatae, flosculos aequantes vel subsuperantes, inferior 5—7-nervia, superior 3-nervia. — *Fl. masc.* Palea inferior oblongo-lanceolata, glabra, hyalina, membranacea obsolete nervosa, acuminata vel in aristam rectam dimidio longiorem sensim attenuata; palea superior oblongo-lanceolata, acuminata, enervia, brevior. Antherae glabrae, lanceolatae, biloculares. Lodicae 2, glabrae, truncatae. — *Fl. hermaphr.* Palea inferior superiorem aequans bipartita, lacinis linearibus acuminatis, e sinu aristam ea ter longiorem geniculatam inferne tortam emittentibus; palea superior elliptico-lanceolata, hyalina, basi nervis 2 opacis notata. Lodicae 2 glabrae ovales, truncatae et bilobae. Ovarium glabrum oblongum; styli 2 terminales; stigmata plumosa stylis sublongiora. Caryopsis libera, oblonga, cylindrica stylis basi persistentibus apice notata; hilum punctiforme; embryo dimidium caryopsidis aequans v. superans. — 24 Juli.

Hab. in collibus siccis et lapidosis Phrygiae prope Éclair-Keüi, Ouchak, Kaïagueul-Déré 1900 m.

Est affinis *Andr. Sibirico* Trin., sed differt foliis angustioribus basi vix attenuatis, glumis villosioribus et arisis longioribus robustioribusque.

Trinius et post eum auct. flosculum superiorem spiculae in *Androp. Sibirico* femineum descripserunt, staminum filamentis solis evolutis. In huc autem mihi hermaphroditus est visus.

950b. **TRACHYPOGON** Nees; in Mart. Fl. Br. I. p. 341.

(*Andropogon* L.; Willd.; H. K. et Steud. Synops.)

(Anders. Öfs. of K. Vet. Ak. Fock. d. 11. Förh. 1857.)

Spiculae geminae, altera sessilis mascula v. neutra et mulica, altera pedicellata fertilis et aristata.

Descriptio: Gramina admodum elata, perennia. Culmus stricte erectus, teres, nodis saepe barbatis. F. pterumque convolutu-liliformia; vaginae constrictae; ligula plus minus protracta. Spica terminalis solitaria aut plures conjugatae alternatim subdigitatae. Rhachis contigua ad pedicellos pilosa. Spiculae geminae, altera subsessilis, altera in pedicello articulatione in medio obliqua pedicellata. Spicula sessilis: glumae subaequilongae, convolutae, cartilagineae, exterior oblongo-cuneata, dorso 5—7 nervis, ap. truncata, interior angustior, acuta tricostata; flosculi duo, unipaleacei, utriusque masculi. Spicula pedicellata glumis fere ut in spicula sessili, sed angustiores et vulgo

hirsutiores; flosculi duo, inferior neuter, muticus, bipaleaceus; superior bipaleaceus hermaphroditus; palea exterior minutissima integra in aristam attenuata, interior minima v. nulla. Lodiculae crassiusculae plicatae et truncatae v. bidentatae. Stam. 3. Stigma plumosa a latere spicularum erumpentia. Caryopsis libera.

Synopsis specierum:

a) Spica solitaria:

α. foliis convolutis-filiformibus:

* hirtis: *T. canescens* Nees.

** glabris: *T. micans* Ands. *T. capensis* Trin. *T. Montufari* Nees. *T. violaceus* Ands.

β. foliis planiusculis:

T. truncatus Nees. *T. Prestei* Ands.

b) Spicae geminae ternae vel quaternae conjugato-digitatae:

α. foliis glabris:

T. gracilis Ands. *T. dissolutus* Nees.

β. foliis hirtis:

T. plumosus Nees. *T. vestitus* Ands.

1. TRACHYPOGON CANESCENS Nees (Mart. Fl. Bras. I. p. 343). Anders. l. c. p. 47.

Spica stricta, elongata, rachi pubescente; spicula sessili lineari-oblonga, obtusa, gluma exteriori dorso 5-nervi et longissime villosa, gluma interiori etiam hirsuta, apice setigera; spiculae pedicellatae gluma exteriori dorso nervosa, longe pilosa, basi argenteo-barbata, apice rotundata, gluma interiori longiori; arista longissima, geniculo toto inferiori villosa-plumosa; foliis densissime villosa-sericeis; ligula oblonga; culmis caespitosis.

Andropogon canescens Steud. Synops. p. 368. n. 58.

Hab. in Brasilia australiori (vidi in herb. reg. berol.)

Differt a *T. Montufari*, cui proximus: villo culmi et foliorum denso albo-argenteo, ligula breviori, spiculis quasi evidentius distichis, spiculae inferioris gluma exteriori longissime villosa, interiori subsetigera, glumis spiculae fertilibus angustioribus, interiori longiori, arista breviori, rectiuscula.

Radix repens. Culmus tripedalis, crassitie pennae columbinae, simplex, teres, sub spica villosus. Folia filiformia, laxiuscula, inferiora culmum aequantia. Spica 4-5-pollicaris, rachis ad insertionem spicularum villosa-barbata.

2. TRACHYPOGON MICANS Anders. l. c. p. 47:

Spica elongata, cylindrica, flexuosa, rachi glabrescente; spicula sessili lineari-oblonga, obtusa, immarginata, gluma exteriori 5-nervi, pubescente, interiore glabrescente; spiculae pedicellatae gluma exteriori dorso nervosa, breviter pubescente, apice rotundata, gluma interiori longiori; arista longissima, longe argenteo-plumosa, foliis convolutis-filiformibus glaberrimis; ligula brevi, ovata; culmo stricte erecto glabro; nodis barbatis.

Hab. in Brasilia (leg. Sellow. In herb. reg. berlinensi et vindob. vidi). A Widgren in Brasilia lecta in herb. Holmiensi asservantur specimina.

Est inter *T. canescens* et *T. Montufari* prorsus medius. Convenit cum illo glabritie culmi et foliorum, cum priori spiculis angustis et pubescentibus. Ab utroque tamen differt: fragilitate culmi, tenuitate foliorum et longitudine spicae (quae fere 10-pollicaris), sed praesertim arista fere tota ciliis longissimis subviolascentibus et sericeo-micantibus densissime plumosa. Spiculae saltem inferiores (i. e. subsessiles) apice violaceae, pulchre discolorae. *T. plumosus* Nees, secundum specimina in herbario Kunthiano, valde differt: spicis geminis vel immo ternis, hirsutiae culmi et foliorum etc.

3. TRACHYPOGON CAPENSIS Trin. (Act. Petrop. Ser. VI. 2. p. 257):

Spica, elongata, recta, rachi et pedicellis glabris, ad insertionem spicularum barbatis; spiculae sessilis gluma exteriori dorso convexa, nervosa, saltem inferne hirta,

immarginata, gluma interiori acutissima, saepe seta brevi mucronata; spiculae pedicellatae linearis gluma exteriori obsolete nervosa, pubescente, obtusa, interiori truncata; arista bis geniculata, inferne dense plumosa, spiculam sexies superante; culmo striato, simplici, glabro, nodis barbatis; foliis convoluto-filiformibus, glabris.

Syn. *Stipa spicata* Linn. Thbg. Fl. Cap. I. p. 107. (ex parte fide specim. orig. in herb. Trin.) sec. Nees.

Androp. spicatus Steud. l. c. p. 368. n. 59.

Trachypogon capensis Nees Gram. Afr. austr. p. 100.

Trachyp. tricuspidata: gluma exteriori spiculae fertilis apicem versus tricuspidata, glabriuscula; foliis omnino glaberrimis etuberculatis, adhuc magis filiformibus.

Hab. in rupestribus montium et in graminosis Africae australioris. (Vidi in herb. Berolinensi, vindobonensi et Neesii).

Etiam haec species cum *T. Montufari* et affinis valde convenit; sed differt aperte: foliis glaberrimis, spica magis rariflora, spiculis longioribus et angustioribus, sessilis gluma exteriori dorso magis cinerascete, glumae interioris nervo medio saepius in setam rectam, fulvam excurrente, apice summo violascente

„Culmus $1\frac{1}{2}$ —2-pedalis. Folia vix $1\frac{1}{2}$ lin. lata; Spica 1—2 poll. longa.“ Nees.

4. TRACHYPOGON MONTUFARI Nees (in Mart. Flor. Brasil. I. p. 342). And. l. c.

Spica valde elongata, recta vel subflexuosa, rachi teretiuscula cum pedicellis puberula vel glabriuscula; spiculis subconfertis; spic. sessilis gluma exteriori oblonga, apicem versus latiori, obtusiuscula, dorso convexiusculo puberula, superne alato-marginata, gl. interiori glabra; spic. pedicellatae gluma exteriori dorso convexo albo-villosa, apice rotundata, puberula, basi cinereo-barbata, interiori longiori obtusissima; arista medio geniculata, inferne pilosa, spiculam sexies superante; foliis convoluto-filiformibus glabra, ligula protracta, acuta; culmo nodis subobtectis glabro.

Andropogon Montufari H. B. K. n. gen. I. 184. R. S. S. V. II. p. 820, Spr.

S. V. I. p. 284. Steudel Synops. p. 368. n. 56.

Hab. in campis aridis Brasiliae, isthmi Panamensi (Seemann) et Oersted et Mexico (ad Jalapam. Schiede). (Vidi in herb. Berolin. Vindobon. Neesii et Oerstedii).

Eximie variat haec species, generis centrum in formas ceteras radians. Variationes notabiliores sunt:

T. grandiflora: spicula sessili pedicellatam subattingente glabrescente et viridula, foliis fere setaceis.

T. pauciflora: spicula sessili vix ad medium pedicellatae attingente, extus magis pilosa, canescente; foliis planiusculis.

* *mollis* (Nees l. c. p. 343): Spicula sessili basin tantum spiculae pedicellatae attingente, spiculis longius et molliter pilosis, apice subbarbatis; arista subplumosa; spica graciliori; culmis magis caespitosis.

Andropogon mollis Steud. p. 368.

Forma e Mexico a brasiliensi recedit foliis planiusculis, culmi nodis barbatis. Cetera tamen plane eadem.

5. TRACHYPOGON VIOLACEUS Anders. l. c. p. 49:

Spica elongata, gracili, fere curvata, rachi et pedicellis spicularum barbatis; spiculae sessilis gluma exteriori lanceolata, medio latiori, apice viridi-nervosa, truncata; spicula pedicellata sessili angustiori, lineari-lanceolata; puberula; arista bis geniculata, adpresse sericea; culmi nodis nudis, barbatis; foliis convolutis glabris, ligula medioeri, subtruncata.

Hab. in Columbia (Merida: Moritz n. 1554. Vidi in herb. berolinensi).

Proxime cum *T. Montufari* * molli convenit, sed differt certe; spica fere duplo minori, tota violascente, rachi non omnino oblecta, spiculis superne angustioribus nec marginatis, culmo adhuc teneriori, ligula breviori, nodisque barbatis. Non tam caespitose crescere videtur; folia inferiora nonnihil planiuscula, superiora brevissima;

spica 3-uncialis; aristae arete adpressae (fere ut in *Heteropogonis* speciebus), nec divaricatim plumosae.

6. TRACHYPOGON TRUNCATUS (Nees, sub *Heteropogone*: Afr. aust. p. 102?) Ands. l. c.

Spica lineari, stricta, acuta; spiculis sessilibus lineari-oblongis, gluma exteriori superne obtuse marginata nervosa, villosa, gluma interiori pubescente; spiculis pedicellatis teretiusculis, longe albo-hirsutis, gluma exteriori apice obtusa, interiori longiori; arista bis geniculata, parte inferiori villosa; foliis planiusculis, cum vaginis glaberrimis; ligula brevi, truncata; culmo erecto, nodis albo-villosis.

Variat:

T. brevespicata: Spica angustiori, 2-pollicari; spiculis brevius sed densius tomentoso-villosis, nodis culmi quandoque glabriusculis.

T. longespicata: Spica longiori, 3—4-pollicari; spiculis longius sed rarius villosis, nodis culmi densissime lanatis.

Andropogon truncatus Steud. Synops. p. 368. n. 51.

Hab. in Africa australi „in itinere per districtum Uitenhage a Krumrivier flumine trans Lamtonsvier et Krakakamma Uitenbagam (Ecklon)“ Nees l. c. (Vidi in herb. Neesii et berolinensi).

Culmus minus quam in *T. Montufari* elatus, ꝑe basi geniculatus, deinde strictus. Folia 2 lin. lata, demum margine involuta. Spicae pars superior aristis conniventiconfortis (fere ut in *Heteropogone* contorto) caudata; spiculae villosae ut in *T. canescenti*; aristae pars inferior sericeo-plumosa ut in *T. micante*. E quibus videtur quam difficile est species certas in hoc genere distinguere!

7. TRACHYPOGON PRESLEI Ands. l. c. p. 50.

Spica elongata, rachi cum pedicellis glabriusculis; spiculae sessilis gluma exteriori oblonga, elongato-cuneata, dorso convexo superne nervosa, apice marginato triloba, gluma interiori glabra; spiculae pedicellatae gluma exteriori dorso convexo glabriuscula, apice sublatori, interiori longiori; arista spiculam quintuplo superante, bis geniculata, remotius plumosa; foliis elongatis, planis, cum vaginis glaberrimis, ligula protracta, acuta; culmo stricto, nodis subbarbatis.

Syn. *Heteropogon stipoides* Presl. Rel. Haenk. I. 335.

Andropogon stipoides Steud. Synops. p. 368. n. 50.

Hab. in Mexico (Haenke) et in Costa Rica, in monte El Viego; 3000' alt. ut etiam in Nicaragua: Oersted (n. 71. 74). (Vidi in hbb. berolin., vindob., Neesii et Oerstedii.)

Culmus 3-pedalis, pennam passerinam crassus. Folia culmea 2—2½ lin. lata, glaberrima; ligula 3 lin. longa, lanceolata, coriacea. Spica semipedalis, saepius rariflora; spiculae 2 lin. longae, angustae, pallide flavidae, apice infuscaetae.

* *secundus*: spica tenuiori; spiculis angustioribus, inferiori minus dilatata dorso longius pubescente, arista longiori inferne plumosa; foliis angustioribus; nodis culmi inferioribus glabrescentibus. — *Heteropogon secundus* Presl. l. c. *Andropogon secundus* Steudel l. c. p. 49.

Hab. iisdem locis ac praecedens.

Haec forma a *T. Preslei* normali notis allatis satis recedit; ad eum tamen omnino se habet, ut *T. mollis* ad genuinum *T. Montufari*. *T. stipoides* Nees ab hoc etiam genere diversus.

8. TRACHYPOGON GRACILIS Ands. l. c. p. 50.

Spicis geminis elongatis, gracilibus, stricte erectis; rachi et pedicellis glabriusculis spicula sessili oblonga, gluma exteriori basi glabra, apice marginata, dorso convexa 7-nervi subpuberula; gluma interiori glabra 3-nervi acuta; spicula pedicellata anguste lanceolata, tereti, basi barbata, versus apicem obtusum obsolete nervosa; aristae dimidia parte inferiori breviter plumosa, superiori glabrescente, spiculam septuplo su-

perante; foliis convolutis-tiliformibus, cum vaginis glaberrimis, ligula mediocri; culmo erecto cum nodis glabro.

— *hirtus*: spiculis latioribus, pedicellatis, apice pilosis

Hab. in Brasilia (Sellow, n. 5358, Gardner 3520). (Vidi in herb. vindob. et berolin.)

* *ciliatus*: spicis ternis vel quaternis, longissimis, pallidis; spiculis longius pilosis et evidentiis nervosis; ligula elongata.

Hab. in Surinam (Hostmann: 1028) et Columbia (Moritz: 728). (Vidi in herb. berolin.)

Habitu *T. molli* subsimilis, eique a Kunth in herbario associata. Culmus 3-pedalis, pennam passerinam crassus, omnino glaber, basi caespitosus. Folia culmo breviora, stricta, sub-pungentia, glabra; ligula a basi ovata lanceolato-acuta, linea longior. Spicae vulgo conjugatae, pallide flavae, 2 lin. latae, subdensiflorae, longior semipedalis. Spicula sessilis 2 lin. longa, apicem versus vix latior, sed truncato-tridentula ala angusta scabriuscula pallida cineta; spicula pedicellata adhuc angustior, vix nervosa. Arista quam in ceteris longior, superne adhuc magis glabrescens, evidentiis bigeniculata.

Forma, quam ciliatam appellavimus, e Columbia et Surinam, a brasiliensi non parum differt. Spiculae e hirsutiae plus minus densa incanae conspiciuntur, gluma exterior vix apice marginata, arista longius plumosa; vaginae nunc apice hirtae, nunc totae glabrae; ligula semper longius (3 lineas) protracta.

9. TRACHYPOGON DISSOLUTUS Nees (Linnaea XIX. 695. Anders. l. c. p. 54):

Spicis geminis vel ternis, elongatis, gracilibus stricte erectis, rachi et pedicellis glabris; spicula sessili oblonga, gluma exteriori dorso convexa glabra, basi subpuberula, apice marginata obtusissima subnervosa; arista inferne brevissime pubescenti; foliis planiusculis, cum vaginis glabris, ligula longissima; culmi nodis barbatis.

Syn. *Andropogon dissolutus* Steudel Synops. p. 351, n. 224.

Hab. in Mexico (specimina in herb. Neesii vidimus).

A priori, cui certissime proximus differt: culmo firmiori, nodis pilis erectis rigidis dense barbatis, foliis longissimis fere 2 lin. latis, saltem intermediis planis, longe acutatis; spicis brevioribus, magis densifloris; spiculis majoribus, glabris, obsoletius nervosis magisque chartaceis; ligula demum unciam fere longa.

De *Trachypogone ligulari* Nees (Andropogon ligularis Steud. Synops. p. 351, n. 225), cujus specimen valde incompletum in herbario Neesii vidimus, quidquam certi enunciare non audemus. *T. macroglossus* Trin. nobis incognitus. *T. ligulari* simillimus dicitur.

10. TRACHYPOGON PLUMOSUS Nees (Mart. Flor. brasiliensis, Gram. p. 344.) And. l. c.

Spicis subternis, elongatis, erectis, rachi glabra vel ad genicula pubescente; spiculis confertis, sessili oblonga, apice obtuso ibique glabrescente, ceterum puberula; gluma exteriori dorso 7-nervi, interiori glabra; spiculae pedicellatae gluma exteriori convexa, costato-nervosa, pubescente, apice rotundata; interiori longiori, acutiuscula; arista bis geniculata, inferne plumosa; spiculam multo superante; foliis elongatis planiusculis vel complicatis, regidulis, scabris, cum vaginis dense tomentosis; ligula exserta, ovata; culmo simpliciusculo, stricto, cum nodis adpresse barbatis.

Syn. *Andropogon plumosus* H. K. nov. gen. et sp. I, p. 149; R. et S. S. V. II. p. 819.

Spr. S. V. I. p. 285 Steud. Syn. p. 381, n. 223.

Hab. in Brasilia (Sellow.) (Vidi in herb. berolin. et Neesii).

Est *T. canescenti* tam propinquus, ut vix eum species jungerem nisi auctoritate aliorum. Culmus et folia omnino molliter sericeo-pilosa; spicae (quarum singula interdum tantum exstat!) quam in ceteris angustiores et longiores; spiculae sessiles apicem versus latiores, calvae, nervis viridibus evidentiis notatis.

In herbario Neesii aliud adest specimen hoc nomine etiam inscriptum, quod differt, foliis latis, planis, longissimis, glabris. Num integumentum foliorum in hoc genere ut etiam numerus spicarum variat?

11. TRACHYPOGON VESTITUS Ands. l. c. p. 52:

Spicis ternis, erectis, angustis; rachi glabra, pedicellis uno latere breviter villosis; spiculae sessilis, linearis, gluma exteriori nervosa, pubescente, interiori carinata, glabra: spiculae pedicellatae gluma exteriori dorso hirta, apicem versus glabrescente, valide nervosa; arista bis geniculata, tenuiter plumosa, spiculam multo superante; foliis strictis, planis, cum vaginis densissime albo-villosis; ligula longissima, lanceolata; culmo simplici, valido, stricto, sub nodis barbatis puberulo.

Hab. in Brasilia, Piauhy (Gardner 2342. Vidi in herb. vindobon.)

Differt ab omnibus haec species certe optima: culmo elato et crasso, foliis densissime cinereo-villosis, spicis tenuibus et gracilibus, ligula fere pollicem producta, angusta, flavescente.

E genere itaque excludendi:

Trachypogon rufus Nees = *Cymbantheliae* Sp. (*C. hirtae* affinis).

Trachypogon scrobiculatus Nees = Item.

Trachypogon argenteus Nees = *Erianthus saccharoides* Willd.

Trachypogon laguroides Nees = *Aphananthe species*.

Trachypogon Minarum Nees = *Andropog. paniculat. species*.

Trachypogon stipoides Nees = Item.

Trachypogon avenaceus Nees = Item.

950 b. SCHIZACHYRIUM Nees.

(Kunth. en. I. 488. et seq. sub Andropogon.)

1. SCHIZACHYRIUM PARADOXUM Büse. — Büse in pl. Jungh. III. p. 359.

Spic. termin. lateralibusq. plurimis capillarib. folio vaginatis, floris fertilib. spicularum sessilium glumella mutica, spiculis pedicellatis hebetatis aristato-acuminatis, f. oblongo-linearibus.

Hab. ins. Sumatrae prope Padang (Jungh.)

950 c. CHRYSOPOGON Trin.

1. CHRYSOPOGON ACICULATUS Tr. (Kunth. Agr. p. 505). Büse in pl. Jungh. III. p. 361.

β. *longifolius* Büse fol. elongatis angustis.

Hab. ins. Javae. (Jungh.)

2. CHRYSOPOGON GRYPHUS Trin. — Explic. sc. de l'Algér. phaner. p. 51.

Andropogon Gryphus L. (Kunth. en. I. 504.).

950/1. SORGHUM Mich. (Kunth. en. I. p. 501.)

v. Schlechtend. Linnaea XXV. p. 171. observ.

Sorgho e nostra sententia species solummodo adnumerandae sunt, quae annuae paniculam gerunt compositam sed haud in rachi articulata, glumasque cartilagineas fructus includentes. Hujus loci sunt: *S. vulgare*, *bicolor*, *cernuum*, *saccharatum* nimia affinitate inter se junctae aliaeque formae affines nominib. distinctae, sed magis dubiae. *Holcum Halepense* vero, cujus descriptio sequitur, in propriam sectionem vel ad proprium genus ducere malle.

1. SORGHUM HALEPENSE L. sub *Holco*. — v. Schlechtend. l. c. (cfr. supra p. 1066. n. 4.)

Semen ex Aegypto acceptum, sub diu cultum, exeunte aestate laete floruit.

Græmen 4—5 ped. etc.

951. **ISCHAEMUM** Linn.;

(Walp. Ann. III, 803).!

1. **ISCHAEMUM MUTICUM** Retz (Kunth, agr. p. 512.) — Büse in pl. Jungh. III, p. 358.
 β. *erectum* Büse; procerum; fol. angustiorib. supremi vagina ampla, lamina subnulla. — An Tagadi Rheede Malab. XII, tab. 49?

951. **IMPERATA** Cyril.

(Walp. Ann. I. 951.)

1. **IMPERATA ARUNDINACEA** Cyr. (Kunth, Agr. p. 477.) — Büse in pl. Jungh. III, p. 365.
 Habit. ins. Javae et praesert. Sumatrae vulgatissima, ad alt. 3000' ascendens.
 β. *glabrescens*; f. angustioribus convolutis, geniculis subglabris. —
 Hab. in Sumatrae graminosis vastis, Padang lawas dictis, pr. Pertubi. Horner in herb. Jungh.
2. **IMPERATA CYLINDRICA** P. B. Explor. scient. de l'Algér. phanerog. p. 44. = *Imp. arundinacea* Cyr. Kunth, en. I. 477.

951 b. **ARUNDINELLA** Raddi.

(Walp. Ann. III, 804.)

1. **ARUNDINELLA FUSCATA** Nees mss. Büse. — Büse in pl. Jungh. III, p. 359.
 Glumis herbaceis, infera ovata, brevior, glumellae inferae fl. hermaphroditi aristis lateralibus brevib., fol. latis vaginisque setosis.
 β. *angustior* Nees mss.
 Hab. ins. Javae prope Tjibogo et in monte Tjerimai. (Jungh.)
2. **ARUNDINELLA TRICUSPIDULA** Büse. — Büse in pl. Jungh. III, p. 360.
 Glumis herbaceis, infera lanceolata paululum brevior, glumellae inferae hermaphroditi floris aristis lateralib. longis, f. angustis glabris, vaginis ore marginaeque ciliatis.
 Hab. iusulam Sumatrae pr. Padang lawas, Horner in herb. Jungh.
 β. *obscurior*; glumis chartac. Caeterum non diversa.
 Hab. in Javae mont. ignivomorum cinere. Reinw. in herb. Acad. Lugd. Bat.

ASTHENOCHLOA Büse.

(Büse in pl. Jungh. III, p. 367.)

Panicula. Pedicelli apice dilatati spiculas cingunt setis congestis, ad quas pedicellus sterilis adstat perbrevis. Spiculae ovales, planae uniflorae; glumae subaequales, apice pilosae, b. setis longiorib., infera apice emarginata, supera lanceolata. Glumellae minimae; infera apice bifida ex incisura longissime et valide aristata aristae parte inferiori tortili, superiore plana serrata; glumella supera subnulla. Stigma . . . Caryopsis ovalis, stylor. residuo bicornis.

1. **ASTHENOCHLOA TENERA** Büse.

Culmus ped., debilis, parce ramosus. Radix repens? F. lin., glabra, utrinque et margine scabra, infra hic illic pilis obsita; ligula brevis.

Hab. ms. Javae ad vias cavas montium, pr. Pidjungan in prov. Jogjakerta. (Jungh.)

Inter Andropogoneas recenseo, sed speciminum perfectiorum examen valde optandum habeo.

INDEX ALPHABETICUS

classium, ordinum, subordinum, tribuum, generum, specierum
sectionum et synonymorum omnium

in

Annalium botanices systematicae

Tom. IV.—VI. obviorem.

Nomina classium literis Romanis maximis traduntur.

Nomina ordinum literis Romanis majoribus traduntur.

Nomina subordinum, tribuum et subtribuum literis crassioribus traduntur.

Synonyma omnia literis vulgaribus traduntur, sed signo „(s.)“ ornata.

Nomina generum, specierum et varietatum literis vulgaribus traduntur.

Illis generibus et speciebus icon-est adnotata quibus signum † oppositum est.

Genera et species signo ° notata characteribus plerumque omnibus essentialibus illustrata sunt.

 — *lunata* Lindl. ° 563, n. 1. † et 929, n. 2, add.
 — *pellucida* Rehb. f. ° 563, no. 3.

Annales hosce botanicos Walpersianos per tria volumina a me continuatos, pro futuro in formam magis abbreviatam et strictiorem redigere multis rationibus coactus sum.

Quam ob rem plantarum singularium diagnoses ipsas non amplius in Annalibus offeram et plerumque tantum fontes litterarios indicabo quarum descriptiones diagnosesque v. observationes de iis graviores inveniantur.

Cyclum decennarium, annos 1856—1865 amplectentem nunc in hoc modo diligenter conabor et excerpta majora jam numerosissima in scrip-
tis meis occulta tantum ad hunc finem diligentius adhibebo.

De tempore autem quo omnia illa excerpta integritate qua debent, ut ad lucem publicam prodi possint rite exsequuturus sim, valetudine eheu valde infesta et contraria oppressus, jam hoc in loco dare certa compromissa minime audeo. —

Bei AMBR. ABEL in LEIPZIG ist erschienen und kann durch jede Buchhandlung des In- und Auslandes bezogen werden:

ICONES FORÆ GERMANICÆ ET HELVETICÆ

simul terrarum adjacentium

ergo

MEDIÆ EUROPÆ.

Auctoribus

H. G. Lud. Reichenbach et H. Gust. Reichenbach fil.

- Vol. I.** Agrostographia Germanica, cum tabulis aeneis 121.
Editio secunda. 1850. color. n. 18 Thlr. schwarz n. 10 Thlr.
- Vol. II.** Tetrodynamae seu Cruciferae cum Resedeis, in tabulis aeneis 102. 1837. 38. colorirt n. 15 Thlr. 9 Ngr. schwarz n. 8 Thlr. 15 Ngr.
- Vol. III.** Papaveraceae cum Fumariis et Berberideis, Capparidae, Violaceae, Cistineae et Ranunculacearum: Myosurus, Ceratocephalus, Ficaria, Ranunculus, Callianthemum, Adonis et Thalictrum, in tabulis 106. 1839. color. n. 15 Thlr. 27 Ngr. schwarz n. 8 Thlr. 25 Ngr.
- Vol. IV.** Ranunculaceae: Anemoneae, Clematidae, Helleboreae et Paeoniae, in tabulis 82. 1840. color. n. 12 Thlr. 9 Ngr. schwarz n. 6 Thlr. 25 Ngr.
- Vol. V.** Rutaceae cum Euphorbiaceis, Sapindaceae, Malvaceae, Geraniaceae, Oxalideae et Caryophyllacearum pars (Sagineae Arenarieae, Stellarieae) in tabulis 103. 1842. colorirt n. 15 Thlr. 14 Ngr. schwarz n. 8 Thlr. 18 Ngr.
- Vol. VI.** Caryophyllaceae (Cerastiae, Diantheae, Sileneae et Lychnideae), Theaceae, Tiliaceae et cum Lincis Hypericineae, in tabulis 124. 1843. colorirt n. 18 Thlr. 18 Ngr. schwarz n. 10 Thlr. 10 Ngr.
- Vol. VII.** Isoëteae, Zosteraceae, Aroideae, Potamogetoneae, Alismaceae et Hydrocharideae cum Nymphaeaceis, in tabulis 72. 1845. color. n. 10 Thlr. 24 Ngr. schwarz n. 6 Thlr. — Ngr.
- Vol. VIII.** Cyperoideae, Caricineae, Cyperinae et Scirpinae, in tabulis 126. 1846. colorirt n. 18 Thlr. 27 Ngr. schwarz n. 10 Thlr. 15 Ngr.
- Vol. IX.** Typhaceae, Irideae, Narcissineae et Juncaceae, in tabulis 100. 1847. colorirt n. 15 Thlr. — Ngr. schwarz n. 8 Thlr. 10 Ngr.
- Vol. X.** Veratreae et Colchiceae, Smilaceae et Liliaceae, in tabulis 102. 1848. colorirt n. 15 Thlr. 9 Ngr. schwarz n. 8 Thlr. 15 Ngr.

- Vol. XI.** Coniferae, Taxineae, Cytineae, Santalaceae, Elaeagneae, Thymelaeaceae et Amentacearum Salicineae, in tabulis 100. 1849. colorirt n. 15 Thlr. — Ngr. schwarz n. 8 Thlr. 10 Ngr.
- Vol. XII.** Amentaceae: Betulineae et Cupuliferae, Urticaceae, Aristolochiaceae, Laurineae et Dipsaceae, cum Valerianeis, in tabulis 111. 1850. . . . colorirt n. 16 Thlr. 20 Ngr. schwarz n. 9 Thlr. 7½ Ngr.
- Vol. XIII. et XIV.** Orchideae, in tabulis 170. 1851. colorirt n. 25 Thlr. 15 Ngr. schwarz n. 14 Thlr. 5 Ngr.
- Vol. XV.** Cynarocephalae et Calendulaceae, in tabulis 160. 1852. color. n. 24 Thlr. — Ngr. schwarz n. 13 Thlr. 10 Ngr.
- Vol. XVI.** Corymbiferae, in tabulis 150. 1854 colorirt n. 22 Thlr. 15 Ngr. schwarz n. 12 Thlr. 15 Ngr.
- Vol. XVII.** Gentianaceae, Apocynaceae, Asclepiadeae, Oleaceae, Styracaceae, Ebenaceae, Aquifoliaceae, Primulaceae, Plumbagineae, Bicornes, Caprifoliaceae et Rubiaceae, in tabulis 150. 1855. colorirt n. 22 Thlr. 15 Ngr. schwarz n. 12 Thlr. 15 Ngr.
- Vol. XVIII.** Labiatae, Verbenaceae, Heliotropeae, Borragineae, Convolvulaceae. — Polygalaceae, in tabulis 150. 1856 et 1857. colorirt n. 22 Thlr. 15 Ngr. schwarz n. 12 Thlr. 15 Ngr.
- Vol. XIX.** Cichoriaceae, Ambrosiaceae, Campanulaceae, Lobeliaceae, Cucurbitaceae, in tabulis 260. 1860. colorirt n. 39 Thlr. — Ngr. schwarz n. 21 Thlr. 20 Ngr.
- Vol. XX.** Solanaceae, Personatae, Orobancheae, Acanthaceae, Globulariaceae, Lentibularieae, in tabulis 220. 1862. colorirt n. 33 Thlr. — Ngr. schwarz n. 18 Thlr. 10 Ngr.
- Vol. XXI.** Umbeliferae. Decas I—XVIII. col. n. 27 Thlr. — Ngr. schwarz n. 15 Thlr. — Ngr.

In Vorbereitung:

- Vol. XXII.** Loranthaceae, Corneae, Araliaceae, Rhamneae, Therebinthaceae. — Onagrariae, Halorageae, Hippurideae, Lythrarieae. — Ceratophylleae. — Saxifrageae, Crassulaceae, Ribesiaceae, Cacteae. — Polygoneae.
- Vol. XXIII.** Chenopodeae, Portulacaceae, Paronychieae, Elatineae.
- Vol. XXIV.** Papilionaceae.
- Vol. XV.** Rosaceae.

Dieses Werk unterscheidet sich von allen ähnlichen dadurch: dass in ihm sämtliche Gewächse in systematischer Folge und in Lebensgrösse höchst naturgetreu abgebildet sind.
